The 160-miles run from Oshkosh to Beloit on Wednesday played all kinds of havoc with the remaining perfect scores. Not one of the cars reached Beloit on time, which was not strange in view of the deep rivers of mud and water that were wallowed through. The worse parts of the run were between Ripon and Brandon, and between Madison and Janesville. In many places the roads were so bad that the cars put through fields and woods to escape the deep slough that filled the roads. Sanger, who finished the first day with no points against him, had trouble with one of the springs that cost him 550 points in addition to an additional debit of 185 points for being over three hours late. Zastrow lost a little over 200 points for minor repairs and was charged 480 points for being that many minutes late at Beloit. A. J. March lost 13 points for repairing a bearing and was charged for breaking the seals of the gasolene tank and of transmission nine times. Sheridan lost 150 points for minor adjustments and 230 points for arriving late, while Hartley suffered a broken spring, which cost 1,940 points, in addition to 515 points for being late. Finch had trouble with the driving shaft of his car and was debited 3,000 points, while Collier was laid up all day with a broken pinion.

Bespattered with mud six of the original starters checked in at Mliwaukee on Thursday after a hard day's run from Beloit. Hartley was the first to finish, followed by Sanger. None of the drivers experienced as much trouble on the last leg of the run as they did the day previous. All the cars but one were penalized, but the loss in points was nominal. Sanger was the only driver to finish the day's run without loss of points. Collier, in the Rambler roadster, waited all day for replacements from the factory and arrived in Milwaukee on Friday, 22 hours 45 minutes late. The observer's card showed no record of the time spent upon repairs so it was only charged 1,365 points for being late. The other Rambler had not reported when the committee announced the results. The total penalties as announced were as follows:

Ed Sanger, Maxwell, 935 points; Robert Zastrow, Jackson, 965 points; A. J. March, Reo, 1,085 points; H. K. Sheridan, White, 1,750 points; S. W. Hartley, Cleveland, 2,680 points; L. A. Finch, Thomas-Detroit, 4,823 points; Edward Collier, Rambler, 1,365 points.

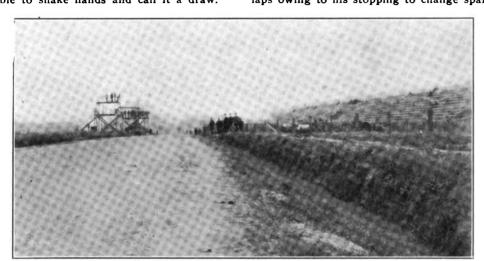

Bridgeport Wants Vanderbilt Race.

It transpires that Bridgeport, Conn., officially is in the field for the Vanderbilt cup race this fall. St. Louis and Savannah were already known to be anxious to provide a course for the race, but Bridgeport's candidacy was made known only last week.

SPIRITLESS SPORT AT SAVANNAM

Lytle and Salzman Take Honors from Thin Fields—But Georgia Turned Out a Great Crowd.

Unless the "big" race at Savannah to-day turns the balance, the promoters of the speed carnival on the Florida beach and the road races on the Georgia roads will be able to shake hands and call it a draw.

GRAND STAND AND OFFICIAL STANDS ON THE SAVANNAH COURSE

The road races typify the A. A. A. sentiment; the flights on the wave washed sand represented the A. C. A. antagonism. Held in adjoining states and although far from the center of disturbance, it has been an open secret that each side has viewed the efforts of the other with more or less jealous eyes. The Florida sandfest came near to being a fizzle. Entries were few, starters were fewer, and finishers were almost, if not quite, as scarce as hen's teeth. These conditions were paralelled by the Savannah Automobile Club's road races, for stock chassis, the first of which were decided yesterday, 18th inst.

The first race—the one for runabouts—over the level but picturesque and well oiled 18 miles course, hung with moss in many places, was won by Herbert H. Lytle, driving a 30 horsepower Apperson. He completed the 10 laps—180 miles—in 3:35:41. Only two others started and but one of them finished. Lytle gained more than a full lap on J. B. Lorimer (40 horsepower Thomas-Detroit). The third starter, L. J. Zengle (50 horsepower Pennsylvania), broke a rear axle on the second lap, after placing to its credit the fastest circuit, 18:54.

In the second race, 180 miles for stock cars not exceeding 575 cubic inches piston displacement, George Salzman (70 horse-power Thomas "Six") finished alone in 3:02:25. The only other starter, F. W. Leland (60 horsepower Stearns "Six"), was put out of the running on the fifth lap by a broken connecting rod.

It follows that there was mighty little of real interest or excitement in either race.

The breakage of the axle of the Pennsylvania in the runabout race after having a lead of 1 minute 35 seconds over the Apperson, gave the driver of the latter car clear sailing for the remainder of the race. The consistent driving of Lytle was one of the chief features. He drove seven of the ten laps in a little over twenty minutes each. His time varied slightly in the three other laps owing to his stopping to change spark

16:51. The time of the car by laps follows: 17:35, 17:02, 16:51, 18:00, 21:45, 17:53, 17:37, 17:23, 19:33, and 18:49.

Savannah's interest was real interest. The city council had declared the day a holiday and the mayor, with other city officials, was present. A monster crowd lined the course and the grandstand, which will seat 5,000 persons, was full to overflowing. The stand was alive with flags and bunting.

The judges' stand on the opposite side of the track was covered with flags of different nations, while club flags and the emblem

mer's time for each of the nine laps fol-

lows: 23:45, 24:21, 26:05, 26:55, 23:57, 20:02,

The cars were sent away at two minutes'

intervals in both races. The Thomas car

was first away in the second contest, but

at the finish of the first lap the timing

showed that the Stearns car had a lead of

40 seconds. There was intense excitement

when it was announced that the latter car

had broken down on the back stretch, as it

gave the Thomas car a walkover. The fastest lap of the day came in the third circuit of the 18-mile course. Salzman drove at better than a mile a minute, the time being

24:33, 25:09, and 22:11.

The judges' stand on the opposite side of the track was covered with flags of different nations, while club flags and the emblem of the American Automobile Association were conspicuous. The soldiers paraded in groups through the streets on their way to the course, and every kind of conveyance

PICTURESQUE STRETCH OF THE MOSS-HUNG COURSE

plugs and to take on gasolene. The ill fortune of the game seemed to follow Lorimer in the Thomas-Detroit. The ripping off of a tire caused the loss of many precious minutes, and later he had to stop again owing to carburetter trouble.

Increasing his lead on each lap Lytle succeeded in gaining a full lap before the race was over. Lytle's time for each of the ten laps follows: 20:29, 20:27, 20:20, 20:32, 26:42, 20:32, 20:20, 24:04, 20:56, and 21:19. Lori-

seemed to be headed that way.

The grandstand was placed about 25 yards back from the road, and along the course for a half mile each way was a wire screen fence. A brass band kept the crowd in humor when the cars were out of sight. The course was policed by 300 soldiers, 60 policemen and 50 flagmen.

To-day, the big race, 360 miles, for which there are eight entries, will occur, and of course a "bigger time" is anticipated.

FRELINGHUYSEN IS "ACGRIEVED"

Thought Automobilists Would Seek to Compromise, but They Did Not—New
Jersey Fight Grows Warmer.

It appears probable that when he appeared at the recent conference of New Jersey automobile clubs, Senator Frelinghuysen did so in the role of professional pilitician. He wore his stock smile and was as notable for what he did not say in defense of his "pickpocket" bill as for what he did say. At that time he was before a considerable crowd and at such times the professional politician usually is very circumspect. A few days later when two representatives of the New Jersey Automobile and Motor Club visited him in the insurance office in New York, where he earns a part of his living, they discovered a Frelinghuysen of another sort. He was disposed to be assertive, but he said enough to make fairly plain that the best he hopes to accomplish is to effect a compromise of some sort. He did not, however, obtain much comfort from the club men. When they left him, they were more than ever determined to fight Frelinghuysenism and all that it stands for.

"When Mr. H. A. Bonnell and myself interviewed Senator Frelinghuysen in his office in New York," said W. C. Crosby, chairman of the New Jersey clubs legislative committee in reporting the result of his visit," it was made clear that to get what they want, they have a fight on their hands which means fight from now to the end of election. The Senator seems to feel himself aggrieved because at the meeting of the automobilists, held in the local club on Friday of last week, he claims that no opportunity was given him to meet the automobilists in a spirit of compromise, and that no effort was made on the part of the legislative committee to meet on mutual ground.

"The Senator unalterably opposes any change in the speed limit, and while he claims that the license fees as proposed are excessive and too high, yet he places the responsibility of such license fees as have been suggested and proposed, on the Governor, and he further claims that to extend a tourist privilege in the State of New Jersey would bring about a condition that would not result to the benefit of New Jersey citizens or its highways.

"In fact, in the discussion, matters assumed such a serious position that the interview was closed by the request of the Senator himself, by using the expression, 'the interview can no longer be permitted'; the cause of taking such a position being that he was unaware that the Governor at any time stated to him, or showed to him by his conversation, that he was in favor of an extension of the speed limit, while the chairman of the legislative committee stated

absolutely and unqualifiedly that the Governor had so expressed himself at the general conference in Trenton with the Governor, or by his expressions led those who heard him to the conclusion that he was in favor of a change in the speed limit, or in extending the speed limit to 25 miles an haur, or possibly 30, claiming that it was reasonable. While the Senator asserted that he did not hear any such expressions on the part of the Governor, the chairman of the legislative committee claims that the Governor was addressing directly the Senator in making his remarks or arguments in connection with a 25-mile-an-hour speed being reasonable, and one which would be more in accord with the use of the highways by automobilists, and yet be with perfect safety. The Senator unqualifiedly denied this, and the issue was taken, and it is a matter that can be very readily decided by the Governor himself, or by those present at the interview.

"In connection with the tourist privilege, if the autoists of this State are to secure for non-resident tourists the sovereign right of touring over the highways of the State, without paying a tax, they will have to fight for it, or secure it by the exercise of the constitutional right invested in Congress, and to that end it is most earnestly hoped that the great body meeting in Washington, which now has the proposed Federal license bill before it for consideration will find it to the interests of these United States not to permit individual States to erect bars and obstacles to prevent non-resident citizens who have conformed to the laws of their own State from enjoying the privilege of touring through or riding through a sister

"In regard to the question of license fees it has become an absolute necessity, and the automobilists may just as well face the situation to-day as at any other time, to fight the constitutionality of a law which permits the State Legislature to exact under the cloak of a registration or license fee a double taxation, which it is admitted has produced to the State in the last year something over \$90,000, and which they deliberately propose with the distinct intention of making the department raise \$200,000, it being admitted that personal taxation is already assessed against the owners of automobiles, and in the city of Newark personal property is assessed and automobile property is assessed also under a distinct and separate item.

"The Senator was told that unless the automobilists received some concessions in regard to speed, in regard to a tourist's privilege, and a license fee not in excess in any case of \$10, that not only every effort would be made to defeat the proposed legislation in the two houses at Trenton, but the automobilists generally, the trade associations, the boards of trade and the manufacturing interests would be enlisted, together with the interests of the hotel associations, to fight the constitutionality of the law, on the

ground of double taxation under the cloak of license or registration fees, and also to test the constitutionality of any law which requires that an automobilist, having conformed to the laws of his domicile State, shall be required to pay for the privilege of using the highways of another State, which is contrary to the sovereign right of every citizen of this great country, and in addition to this, every legitimate means will be used to defeat the Senator in his campaign in the fall for re-election. In order to get fair play from the automobilists' standpoint, every foot of the way has got to be fought; and as it now stands, the Senator states that he is going to have a conference with his fellow Senators and see exactly what position the legislators themselves will adopt, practically intimating that what they say will be the result, and the automobilists' or the manufacturers' interests will not be considered.

"In regard to the veracity, that was questioned on the part of the Senator, as to what took place at the conference with the Governor, or the representations made, they can be easily established by those who were present, and an effort will undoubtedly be made to provide such substantiation; that when a Senator misrepresents he is doing unqualifiedly and unjustifiably what he has no right to do."

Dealers to Fight Frelinghuysen.

With many out of town members included in the large attendance the New Jersey Automobile Trade Association, at its annual meeting in Newark, Thursday evening, 12th inst., gave full discussion to the proposed new automobile legislation. The association will fight the amendments to the existing law proposed by Senator Frelinghuysen, but will support the clause in the bill providing that lights shall be displayed on all vehicles at night. It was announced that the entire Hudson county delegation in the legislature promised to vote against the Frelinghuysen amendments.

All the old officers were re-elected for another year, while one new name was added to the executive committee. The officers are: George Paddock, president; J. W. Mason, vice-president; W. H. Ellis, secretary, and R. A. Greene, treasurer. The executive committee is made up of C. R. Zacharias, of Asbury Park; G. E. Blakeslee, of Jersey City; G. M. Russling, of Paterson; Inglis M. Upperson, F. L. Martin, Leonard B. Zusi and M. O. C. Hull.

Cop Sues Motorist for Damages.

Knocking over a policeman by running into him with an automobile may entail heavy expense. John J. Callahan, a former policeman of Pelham, has just brought suit in the Supreme Court at White Plains for \$50,000 damages for injuries against William McCord, an automobilist of Greenwich, Conn., who, Callahan charges, knocked him over with his automobile when the policeman was trying to arrest him for speeding.

AMERICAN ENTRY 500 MILES AREAD

Is Now Traversing Nevada—French Motobloc Quits "Race" at Omaha—Queer Beatures of the Contest.

The New York-Paris "race" has penetrated as far as Nevada, the sole American entry, the Thomas car, which now is being piloted by Harold Brinker, having put up at Ely in the Sage Brush State last night. The day's run was 141 miles, the total distance from New York being 2,859 miles. The Thomas's nearest competitor, the Zust, At Omaha he said that, as he understood the rules of the "race," the contestants were not to be detained in the United States beyond three weeks and might take train on March 5, to be at Seattle on March 10 or earlier.

"Now," he added, "we have been on the way five weeks and have spent or strewn dollars by the road because the car has at each moment needed assistance to get out of the mire, snow, and mud in innumerable instances.

"On our part we have not emphasized the thefts by many people of our possessions, and when we object they tell us it was for the snow, mud, shallow streams and over rail-road cross ties. The car reached Evanston, Wyo., to which it was run on the tracks of the Union Pacific R. R. as a train, with the chief dispatcher of the U. P. in the role of conductor, the American car was able to avoid the impassable snow drifts on the road from Carter, but between this last named town and Church Butte, the roads, thick with soft mud, had to be used. On the 14th they entered Utah and encountered the worst roads of the trip from New York. The railroad tracks were again used to the detriment of the tires, three of which were destroyed.

THE AMERICAN ENTRY MIRED IN THE MUD NEAR MEDICINE BOW. WYO.

is 500 miles behind—at Granger, Wyo.; the De Dion, which was laid up at Grand Island, Neb., is 1,200 miles behind the Thomas, and the Protos, which arrived at Columbus, Neb., is 70 miles in the rear of the De Dion.

The story of the week is largely the story of other weeks—a story of struggles through snow, mud and water, with the American car far in front. The foreigners have had frequent recourse to the Union Pacific railroad repair shops, and the remarkable "race" spectacle has been presented of a car waiting three days for the arrival of a certain brand of tires and of other cars being loaded on railroad cars and shipped ahead for repairs and then shipped back again to resume the "race" where the breakdown occurred.

The biggest development of the week, however, was the apparent quitting of the French Motobloc. Mr.Godard, who is in charge of it, and who it is said is badly wanted in Paris to explain certain financial transactions during the Paris-Pekin "race," has found the strain too great for his pocket-book. The constant repairs and other "charges unforescen," as they are described by Godard, induced him last night to load his car on a freight train at Omaha, where it had been shipped by rail and remained three days for repairs. The Frenchman says he means to journey by rail to San Francisco.

purpose of getting souvenirs. Then I cannot continue to carry along the Motobloc on account of charges unforseen and without end."

The Thomas car, in charge of E. Linn Mathewson, who succeeded Montague Roberts as its driver, rolled into Ogden, Utah, on the 15th, where he relinquished the wheel to Harold Brinker. The journey across Wyoming had been a struggle through

BUCKING THE SNOW IN WYOMING

Having run day and night for 25 hours, they entered Ogden completely fagged out. Of the last 50 hours Mathewson had been at the wheel for 47 of them. Snow and mud had been continually encountered, and he was glad that his work had finished as Ogden was the place where Harold Brinker was to succeed him as driver.

Until 4 o'clock of the following afternoon the car was given a general but hasty overhauling. At this hour, followed by a procession of the Ogden automobilists, the trip was resumed with Brinker driving. By way of variety several sand storms were run into and tortured those of the crew who did not possess good goggles; good roads were encountered, however, and no stop of any length was made until Cobre was reached, 182 miles from Ogden. The hardship of this journey lay in the fact that it was made perforce on empty stomachs. At Montello, after a run of 162 miles, the food that was obtainable was not fit to east, 20 miles further, in Lucin, Utah, the meal consisted of salt mackerel and tea. Cobre, however was able to furnish a good square American meal. Meanwhile the foreign cars were having their own troubles far be-

After waiting 24 hours at Paxton, Neb., for a sprocket and chain the Zust made the trip to Cheyenne, Wyo., without incident.

Sirtori gave his Italian car on overhauling in Cheyenne, preparatory to crossing the Rockies. In that city the hospitality of the natives so impressed Haaga, the German mechanician on the Italian car, that he declared his intention of returning and making it his home after the car reached Paris. The overhauling in the U. P. shops was thorough and the 57 miles to Laramie was quickly traveled. After a stop for lunch they proceeded to Dana through heavy roads, which grew much worse as Medicine Bow was approached. When 5 miles from this town the car was abandoned until horses could be procured to drag it on.

Although the lighter Thomas had been able to cross the North Platte river on the ice, Sirtori was afraid to risk his heavy car in an attempt to do likewise. He finally ar-

was made evident. It waits even for tires from Europe. After a three day's wait the tires came and the car was driven the 100 miles to Dennison, in rapid time. Here another banquet greeted Lieut. Koepper, whose progress has been marked by these convivial spreads of various German societies. In one of his speeches Koepper remarked: "I have a good car, in perfect condition, able to make good speed, yet I find myself a month on the road and advanced only 1,500 miles. Our main trouble has been tires."

The Motobloc, having received a complete overhauling in Clinton, Iowa, where it had been shipped by train from De Kalb, 80 miles away, was pronounced fit to resume, and Goddard hit on the more or less happy thought of making up the 80 miles by run-

Dr. C. B. Parker, of the Long Island Automobile Club. R. G. Howell, the grand marshal, has appointed the following aides for the various divisions: W. I. Fickling, first division, composed of cars of 1903 and earlier, old racing cars, and the Briarcliff racers; I. H. Manning, second division, composed of dealers' stock models; Alexander Howell, third division, composed of decorated cars; H. E. Wagner, fourth division, composed of commercial vehicles. Each marshal will be allowed to appoint as many assistants as are necessary in his own division.

The exact date of the hill climbing contest has not yet been determined on, but it will be either Monday, April 6, or Thursday, April 9. The earlier date is favored by many on the theory that the contest would

HITTING THE HIGH SPOTS IN THE ROCKIES

ranged with the U. P. to cross on the railroad bridge, so he bumped over the trestle and was encouraged to find fairly good roads on the other side. With the car in good shape and the roads fair, good time was possible and he gained on the American, reaching Granger, Wyo., on Tuesday, after a 30 mile run. As the crew was tired, it was determined to sleep here.

The crew of the De Dion, after traveling without incident for 29 hours with neither food or sleep, determined to spend the night in Missouri Valley, Iowa. On Friday, the 13th, they broke a driving pinion and were forced to spend three days in Crescent, 10 miles from Omaha, waiting for the new parts that were being made in the U. P. shops of the latter city. Starting again on Sunday night. St. Chaffray announced that he hardly expected to catch the Thomas before Alaska was reached. Better roads were found the next day and the trip to Fremont was made with no incident other than an announcement from St. Chaffray that he had found a lot of screws and pieces of iron in the gear case. He presumed they had been put there by a practical joker. Three miles out of Grand Island the DeDion broke a spring and was towed back to await another from Cheyenne.

Hard luck was the portion of the Protus. Having made 38 miles after a day of travelling they reached Ames, Iowa with all tires used up. The character of the race ning back 40 miles and then returning over the same route to Clinton. In this way he did the requisite mileage, but it was not over the prescribed course. However that matters little in "races" of this kind, and the trip was continued to Cedar Rapids, where the solid tires gave way to pneumatics. Continuing the car was lost somewhere and wandered about Iowa until set right by a native after it had been caught in a terrific rain storm which drenched the crew. Tama was reached Sunday night and Ogden on Monday. The heavy roads prevented over 17 miles being done for a whole day's work. Near Carroll something went amiss and the car was shipped to Omaha for repairs. After which Godard practically announced he had had enough and would quit.

Officials Chosen for the Carnival.

Having finally determined that the principal features of Carnival Week are to take the form of a night parade and a hill climbing contest—by day, of course—the New York Automobile Trade Association is now arranging the details of the celebration that is to mark the tenth anniversary of the introduction of automobiles in New York. The parade is to occur on the night of Tuesday, April 7. The officials for it were chosen late last week, as follows:

Judges: President Colgate Hoyt, of the Automobile Club of America; A. R. Shattuck, ex-President Robert Lee Morrell, and serve to open the carnival with an event that would attract wide attention. The Fort George hill, which was first used for a competition last year, has been selected as the course for the climb, the necessary permission having been obtained from the city authorities.

It is believed that the contest will call forth from 50 to 100 entries. The entrance fee has been placed at \$10. The subdivisions include six classes for gasolene machines, an electric class, a steam car class, and a free-for-all. The restriction of the steam cars to one class regardless of price, while the gasolene machines have several classes based on the selling price, has drawn forth a protest from George W. Bennett, manager of the White company's branch. Mr. Bennett holds that the steam vehicle should be admitted on an equality with the gasolene machine in the price classification divisions, but the Carnival committee maintains that it has a right to do as it pleases.

Spain Modifies Frontier Rules.

One of the annoyances of automobile touring in Europe has been lessened by the modification of oppressive Spanish rules enforced on the Franco-Spanish frontier. These rules have been the subject of many protests. That the protests finally have awakened the higher authorities is indicated by an unwonted display of courtesy and leniency by the officials at the frontier.

FEDERAL RIGHT TO REGULATE

Constitutionality of Proposed National Law Argued Before Congressional Committee—Terry Makes Strong Points.

The hearing on the Cocks bill to provide for the Federal registration and numbering of automobiles when engaged in interstate travel was held by the committee on the judiciary of the House of Representatives at Washington, D. C., Thursday, March 12th, This bill, which was prepared by the legislative board of the American Automobile Association, attracted a notable gathering, and while despatches from Washington indicate that the bill will not be favorably considered, it stated that the bill is by no means lost. It is said that the committee adheres to the principle that the licensing of vehicles is solely a police power and therefore purely a state function and not within the constitutional scope of Congress.

Among the representatives of the American Automobile Association present were: William H. Hotchkiss, president American Automobile Association, Buffalo; Charles Thaddeus Terry, chairman Legislative board, American Automobile Association, New York; Frederick H. Elliott. secretary. American Automobile Association, New York; Russell A. Field, secretary, Long Island Automobile Club, Brooklyn; A. G. Batchelder, New York State Automobile Association, New York; C. H. Benedict, Automobile Club of Schenectady; Robert P. Hooper, Automobile Clubs of Germantown and Philadelphia; Paul C. Wolff, Pennsylvania Motor Federation and Automobile Club of Pittsburg; Jacob D. Rider, Lancaster Automobile Club; G. Douglass Bartlett, Quaker City Motor Club, Philadelphia; W. C. Crosby, New Jersey Automobile & Motor Club and Associated Automobile Clubs of New Jersey; R. A. Green, treasurer, New Jersey Automobile Trade Association, Newark; J. H. Edwards, Automobile Club of Hudson County, Jersey City; William H. Hunt, Automobile Club of Hudson County, Jersey City; Walter S. Schutz, counsel, Connecticut State Automobile Association, Hartford; F. T. Staples, vice-president, Connecticut State Automobile Association, Bridgeport; F. C. Donald, president, Chicago Motor Club, Chicago; Sidney S. Gorham, Chicago Automobile Club, Chicago; Robert B. Caverly, president, Automobile Club of Washington, D. C.; LeRoy Mark, secretary, Automobile Club of Washington, D. C.; Charles J. Forbes, Jr., secretary, Cleveland Automobile Club; Dr. A. B. Heyle, Cincinnati Automobile Club; Hon. F. H. Gillette, Automobile Club of Springfield, Mass.; L. R. Speare, Bay State Automobile Association and Massachusetts Automobile Club, Boston; Osborne I. Yellott, president, Automobile Club of Maryland, and Maryland State Automobile Association, Baltimore; John Bancroft, president, Delaware Automobile Association, Wilmington; F. E. Chapman, West Virginia State Automobile Association; George Ade, Indiana State Automobile Association; S. Royer Davis, secretary, Automobile Club of Philadelphia, and chairman of the Legislative Committee Pennsylvania Motor Federation.

Mr. Terry also appeared as general counsel for the National Association of Automobile Manufacturers. The Professional Chauffeurs' Club of America was also represented by President Sullivan and ex-President Walters, with Xenophon P. Huddy, Esq., its counsel. The latter discussed the bill briefly, urging chiefly that it be amended so as to permit the federal registration of chauffeurs while operating motor vehicles in states other than those of their residence.

The hearing was opened by President Hotchkiss, who briefly pointed out the necessity for interference on the part of the federal government to protect the motorists of the nation while operating in those states which require the registration of non-residents and use the requirement as a means to taxation

The principal argument was made by Charles Thaddeus Terry, Esq., chairman of the Legislative Board of the American Automobile Association and representative of the National Association of Automobile Manufacturers. Mr. Terry's presentation, both of the facts which make such legislation desirable and necessary, and of the constitutional argument in favor of the bill, was stated by Congressmen present to be one of the most brilliant ever heard by the committee.

It was practically conceded by the committee that legislation of the kind asked for was necessary, and that it should be accorded if Congress had power under the federal Constitution to regulate the registration of motor vehicles when operated in states other than those of their owners' residences. It was apparent at the outset that, the question being an entirely new one and the powers of Congress being necessarily limited to its control over commerce between the states as granted to it by the Constitution, and as construed by the commerce decisions of the Supreme Court, the problem to be solved was whether Congress could in any way regulate the use of a pleasure vehicle, when operated on the highways of a state other than the state of the owner's residence, in other words, when engaged in interstate travel. It was apparent, also, that most of the members of the committee had grave doubts as to such travel being within the meaning of the word "commerce" in the Constitution. Hence, when it is stated that after a two hours' presentation by Mr. Terry several members of the committee stated that while they had been very doubtful, they had been either wholly or almost convinced that Congress had the power to pass the Cocks bill, the

high merit of Mr. Terry's presentation will be appreciated.

In substance, his argument was that though the word "commerce" originally connoted an interchange of commodities from state to state, the supreme court had from decade to decade widened the meaning of the word until it now included not merely trade, but transportation, the interchange of telegraph messages, the carrying of lottery tickets on the person of a mere traveler, travel itself, in fact, intercourse between the states in the broadest possible sense of that word. It can be stated with some confidence, that as to this the committee seemed to agree with Mr. Terry. In other words, he demonstrated to the committee that Congress had power to legislate concerning the registration of the newest means of intercourse, or intercommunication, between the states.

Mr. Terry also called attention to a line of decisions by the Supreme Court, which held that under the commerce clause of the Constitution, the federal government had power to pass laws which would prevent one state from exacting license fees, tolls or taxes, either from vessels or from their pilots or masters, when plying navigable waters entirely within a state, other than the state where the vessel was enrolled: and called attention to the fact that there was in principle no difference between the natural highways of a state or nation, that is the waterways, and the dirt highways, and also that there was no difference in principle between a vessel navigating such natural highways, and a wheeled vehicle using such artificial highways. Asked by Congressman Malby of the committee, whether there was not a distinction between vessels engaged in interstate trade and purely pleasure vessels, Mr. Terry called attention to the case of the yacht "Yosemite," in which the Supreme Court held that there was no such distinction and that a vessel operated between ports of different states, and purely a pleasure yacht, was properly subject to a law preventing exactions by states other than that of its enrollment, and that this statute rested solely on the commerce clause of the Constitution.

While the chairman of the committee and several of its members repeatedly asked questions which indicated that they had grave doubts as to the constitutionality of the bill, Mr. Terry's argument made a deep impression and entirely convinced several of the committee. It is not likely that final action will be taken on the bill for some weeks, owing to other matters pressing on the attention of the judiciary committee, but, it is confidently expected by Mr. Terry and his associates, that such action will ultimately be favorable to the bill.

Interviews with members of Congress not on the judiciary committee, led to the conclusion that should the bill be favorably considered by such committee, the bill will pass without substantial amendment or opposition.

MUST GIVE TWO-THIRDS OF ROAD

Unusual Provision of Ohio's New Bill—Graded Fees and Other Features of the Measure.

Automobile legislation in Ohio has progressed during the present session as far as the passage in the Senate, on the 12th inst., of Senator Ward's bill which includes. a provision for speed limitations which cannot be changed by local ordinance or laws. This feature of the measure, which passed with only one vote against it, threatens its future even in the Senate, where it will have to be reconsidered because of errors made in amending it during its progress. Now, it is said, certain senators from the country will endeavor to amend it so as to take from the State the power of speed regulation and restore it to the counties, villages and cities. The limits specified by the bill as it stands are 8 miles an hour in business sections of municipalities; 15 miles in other sections of municipalities, and 20 miles in the country.

The bill requires the registration of all automobiles by the Secretary of State, the scale of fees being \$3 for cars up to 12 horsepower; \$5, up to 20 horsepower; \$10 up to 50 horsepower, and \$15 for higher powered machines. Dealers get special licenses for \$10 for each type of car. Owners must carry their certificates of registration with them, and the driver of a borrowed automobile must carry the written consent of the owner. Chauffeurs must register at a cost of \$2 for license. Non-resident owners must only comply with road rules and the regulations concerning equipment, if they are registered in their own states.

License numbers must be displayed front and rear on machines. Bills, horns and brakes are required, and lights displayed must illuminate the license number.

The road rules require that the motorist must slow down and stop when signaled so to do by the driver of a horse vehicle. Also he must give two-thirds of the road to persons with horse vehicles whom he meets.

Motorists arrested are to have right of immediate hearing or of giving bail not to exceed the maximum fine for the offense charged. The Secretary of State is to register cases of arrest and conviction and notify all county clerks of the same.

Penalties are provided as follows: Fines of \$25, \$50 and \$100 and 30-day sentences are provided for first, second and third violations of registration, speed, equipment and road rules sections of law. Using fictitious license number or one belonging to another draws fines of \$25, \$50 and \$100 with 60-day sentences, according to the offense. Failure of chauffeurs to register draws fines of \$50 and \$100 and suspension of right to be registered for two years. Failure to show written consent from owner for use

of machine draws penalty of \$200 fine and six months' sentence. Revenues from this source are to be used for maintenance and repair of roads.

Anti-Tire Chain Sentiment Spreads.

Anti-tire chain sentiment has penetrated to the senate chamber at Trenton, N. J., and has resulted in the introduction of a bill by Senator Leavitt. It would amend the motor vehicle act by providing that no motor vehicle shall have chains on its tires when using gravel or macadam roads.

The Fairmount Park Commission of Philadelphia also has carried out its intention of prohibiting the use of chains on the tires of automobiles when using roads in the park. The commissioners heard automobilists on the matter several weeks ago, as reported in the Motor World, and in their rule, adopted on the 12th inst, they exempt Belmont avenue. As further indicating an intention to treat automobilists fairly they agreed to ask councils for money necessary to asphalt the north side of Girard avenue, between the bridge and Parkside avenue. This improvement is contemplated with the idea that it would be a convenience to automobilists bound for points on the main line who now use park drives.

Arkansas Automobilists Organize.

With promise of becoming a lively factor in the motoring world, the Automobile Club of Little Rock (Ark.) has organized in that city, to affiliate with the A. A. A. The officers chosen were: President, Moorehead Wright; first vice-president, J. P. Runyan; second vice-president, J. N. Heiskell; secretary, Irving S. Hirsch; treasurer, Perry Stifft. The officers named, with E. P. Ladd, C. A. Pratt, J. E. Osborne, W. B. Miller, and J. A. Van Etten, will compose the board of directors. Capt. C. A. Pratt was named as director to represent the Arkansas association on the A. A. A. board.

Kentuckians Incorporate State Association.

The Kentucky State Automobile Association, comprising the Louisville, Legington and Owensboro clubs, has been organized and incorporated with the following officers: President, Ira S. Barnett, of Louisville; vice-president, F. R. Toewater, of Lexington; secretary and treasurer, Walter Kohn, of Louisville; directors, Louisville club, Ira S. Barnett, Dr. Lindsay Ireland, Walter Kohn; Gluegrass Club, of Lexington, F. R. Toewater, E. H. Alexander; Owensboro Club, J. T. Dawson, Allen Reid. The club will affiliate with the A. A. A.

Planning for Road Around Two "Knobs."

Jacobs Ladder and Morey's Hill, the two famous and neighboring "rises" near Lee in the Berkshire Hills, on the route between Lenox and Springfield, Mass., may lose their terrors for tourists. Efforts are being made in Boston and elsewhere to raise a fund of \$15,000 for the purpose of building a road around the two "knobs."

PREPARING FOR THE GLIDDEN TOUR

New Rules Will Not Permit a Tie to Remain Unbroken—Allowances Likely for Tire Troubles.

One feature of the revised rules for the 1908 A. A. A. tour and contest for the Glidden trophy that is certain to cause general commendation, is a provision that cuts the string the Buffalo Automobile Club has had attached to the Glidden trophy ever since it first was offered for competition. It is understood that the new rules will provide for a run-off in case of a tie between any two clubs. Under the old rules the trophy had to be distinctly won from the holding club by some other organization, and in 1906, when the Buffalo club was in a tie with some others, the Buffalo club retained the trophy. This year if the Buffalo club finishes in a tie with another one or two, it will have to fight it out with them on the road.

The rules have not yet been officially given out, but enough of their probable character is known to permit of discussion. The plan for awarding the trophy this year will be an improvement on that of last year. The desirability of a club being able to enter a team composed of one make of cars has been considered and one club will be allowed to spilt up nine cars into three teams of three cars each, or six cars into two teams. The trophy will be awarded on the basis of club teams, probably to the club having the most teams with clean scores, or in event of no clean scores, to the club standing best in the penalization table. The penalization system will be the same as last vear.

Another interesting provision that probably will be made is one concerning deducting the time lost because of tire trouble. Many manufacturers object to having to make up the time lost in the repairs, because tire troubles are a gamble, pure and simple; but it was pointed out that if the rules provided for allowing the time spent fixing tire some would deliberately puncture a tire and repair it, in order to take time to let the engine cool, should it become overheated. It is likely that this objection will be met by a rule that time spent in tire work will be allowed, provided the engine is kept running.

Another interesting point about this year's tour is that all possibility of discussion among the committee in charge has been done away with and there will be one executive head to it, F. B. Hower, who was the actual manager last year, although a committee was nominally in charge. This definitely will fix all responsibility while the tour is in the field. It is supposed that Mr. Hower has learned to enforce rules and routes as they are laid down and not merely when and how he thinks they should be enforced.

FACTORS AFFECTING TIRE LIFE

Scientific Reasons for the Rapid Wear of Back Tires—Typical Cause Explained and Others Specified.

Many motorists have had occasion to wonder why their back tires wore out so much more rapidly than the front ones. Generally speaking, the all-inclusive answer to this question has been that the traction to which the drivers are subjected is sufficient to account for the difference. In a paper recently presented before the Royal Automobile Club of Great Britain, however, Mervyn O'Gorman, the well known scientist and pioneer motorist shows that a number of other factors also ought to be taken into account as having a very important bearing on the matter.

"Many parts of a car seem to have nothing to do with tires until one dwells upon their elementary functions," he remarks.

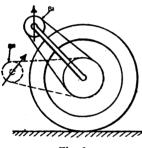

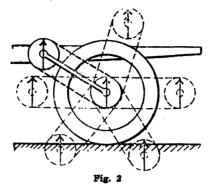

Fig. 1

"For example, nothing seems more inert in this connection than a distance rod. Considered as the piece through which the car is pushed forwards, it is known to be in compression and accordingly stiff. As being the piece which is connected both to the frame and the axle it must be hinged at the fixing, and as the sides of the car often rise and fall unequally on the springs, the distance rod must also be pivoted for side movement at the hinge. . . .

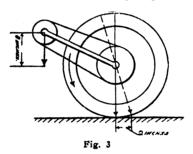

"With a chain driven car the distance rod is often supposed to prevent the taut side of the chain from varying in tightness when the car body moves up and down on its springs. If it fails in this the drive to the road wheels will be irregular and the tire will rub. Looking into detail shows us that it does fail, and the question to be answered is simply this: Is the tire rubbing due to this cause negligible? To study this we will first suppose the car at rest, the back road wheels prevented from turning, and a very heavy weight put on to the chassis over one of the back springs. This lowers the chassis, and with it the front sprocket (Fig. 1), from the position S' to S", which we may suppose to be the extreme movement when the car "bumps." say, 8 to 10 inches.

"The distance rod prevents S' from leaving a circular path round the back sprocket. The upper chain is carried round with it,

and is obviously wound on to the back sprocket. At the same time a certain amount of chain is, for a similar reason, wound off the moving one. If the sprockets were of equal size, the amount wound off would equal the amount wound on to the

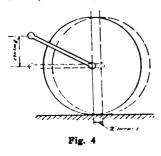

other, and neither would turn on its axis, as shown in Fig. 2. But normally the front sprocket is the smaller, and accordingly it has to rotate as shown in Fig. 1. It is very important to appreciate the amount of this rotation and its direction. If a small sprocket moves once round another having a larger circumference, a length of chain equal to that larger circumference will be wound onto the larger sprocket. If,

then, the smaller sprocket is one-third smaller, as is common, it will have to rotate through one-half of a revolution, and proportionately for fractions of a revolution. The direction of its rotation will, as shown by the sloping arrow in Fig. 1, be clock-wise for a downward movement to the dotted position. It will be noted that this tends to turn the engine backwards, after taking up all the back loss or play in all the gears engaged, including the chain.

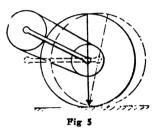

"In practice, when the car is not station-

ary, the converse is usually the case—namely, the front sprocket, S, is prevented from backward rotation by the engine or the foot brake—and the back wheel must unless the chain snaps, rotate forwards

(the backlash having already been taken up by the engine pull). Every time the tire rides over a lump this occurs in some degree, and when, as sometimes happens, the car body oscillates vertically over the full range of clearance of the springs, the movement is greatly exagerated.

"It is easy enough to calculate the amount of movement, but it is more convincing to illustrate this forward rotation by a model made to half scale of a chain drive and road wheel. The front sprocket of the model is locked, and the road wheel free to turn. Taking a vertical downward movement of the springs of 8 inches, and the usual dimensions of wheel and sprocket given in Fig. 3, the wheel turns through such an angle that the tire slips forward 2 inches. Simultaneously the radius rod, in moving from a sloping to a more horizontal position, pushes the axis of the wheel through an additional space of 2 inches. as shown in Fig 4. It is now necessary to see how long an interval of time this movement takes. If the time is very short, the inertia of the car and engine respectively

will prevent their moving forward, and the wheel will consequently have to skid. . . .

"A simple calculation shows that a bad road hollow 2 feet wide traversed at 40 miles per hour is passed in less than 1-29 second. Whether or not the wheel follows the profile of the ground on the first part of the down slope, it will be found in most cases that by the time it has struck the far side of the puddle and rebounds from it the car body will have started its downward movement. We have, therefore, the wheel moving up and the car body moving down with considerable velocity. As far as I could judge when noting this, the car had not moved three feet beyond the hollow before the bump occurred. At this speed three feet represents 1-20 second, and during this short time the car would either have to be thrust forward 4 inches, or the road wheels must skid round that amount.

"To determine which must occur is quite easy, thus: To thrust a 3,000 pound car forward 4 inches in 1-20 second, is to give it an added velocity of 80 inches per second, or 6.28 feet per second, or 4.4 miles per hour, and this would be done in 1-20 second. Such a push, if continued for a whole second, would give a car a velocity of 88 miles per hour (in one second), and would require a pull of 12,000 pounds. This pull is seven or eight times the adhesion between the ground and the back wheels, so that we may safely say that the wheel skids, both

at this speed and at speeds of one-half and one-third of this amount. The amount of the skid is 11 per cent., which represents work done in wearing and heating the road, raising dust and heating the tire. The power to effect this work is derived from the engine, and is a loss. If we suppose that on the average this loss amounts to only 5 per cent., because the average travel of the springs may be taken at 4 inches, we still find quite an important diminution of speed when the car is running all out. A remedy has occurred to me for this trouble in chain cars. I have two different sprockets from those we have been considering, both for the back and front. Contrary to normal practice, the small one is on the road wheel, and the large one in front. I will recall that we had 2 inches of skid due to the sprockets and 2 inches more due to the radius rod, and all I propose to do is to work these two skids in opposite directions, and as nearly as possible simultaneously. This I show in Fig. 5, where at the end of the downward movement of the sprocket the two movements have, within a certain margin of error, cancelled out. In this particular case the sprockets are of the same diameters as were used before, their positions only have been exchanged."

Speaking of cars driven by propeller shafts, the author refers to one which "has the curious property that, if fitted with a fine ratchet sprag, it can be caused to travel forward by the persons in the tonneau simply jumping up and down so as to work the springs, and illustrates the effect that a road shock has in causing the road wheels to turn forward, or, failing this, to skid.

"From the point of view of the heavy unsprung weight on the back axle, the propeller shaft car should be substantially harder on tires than the chain driven vehicle, and in some cases it is so. In other methods of construction such care has been taken of what I have called the 'radius-rod effect,' that in spite of the above indicated disabilities they are actually less wearing to tires. In the propeller type car the following provisions must be made: (a) A universal joint to allow the transmission to be flexible. (b) A push rod (corresponding to the radius rod of chain cars) to push the car along. (c) A torque rod, sometimes the springs, sometimes the propeller shaft itself, arranged to take the reaction of the drive; that is to say, a piece which tends to lift the front of the car when the engine exerts its power. Each of these provisions has problems incidental to it, which bear on the wear of tires. . . . Both causes of wear mentioned in connection with chain driven chassis are found here in some degree: (1) The axle is forced backwards, because the horizontal projection of the push rod is increased. (2) The wheel is caused to rotate through an angle swept out by the push rod, and these two troubles are additive.

"Lastly, in those numerous cases when the push is taken through the springs the flattening of the spring gives a further movement backwards to the axle, and this movement is again additive.

"In the best type of live axle cars employing two universal joints, a slide, and a parallelogram of radius rods, the effect we have been considering is reduced in practice to less than one inch of tire movement for 8 inches of spring movement. All that is now wanted is that a demand should arise for cars which are easy on tires, as against cars which are simply cheap in capital cost."

By way of conclusion he adds a few other causes of wear in the rear tires of the car, not enumerated above, nor belonging in the same category, which are as follows:

"(1) Engine driving effort: (a) Even if the turning moment is uniform. (b) Ununiform turning moment exaggerates this wear somewhat, but the un-uniformity of the ordinary engine of four or more cylinders is smothered under the other un-uniformities introduced elsewhere.

"(2) Clutch: (a) If fierce or let in roughly. (b) If fierce, especially when reversing, as the torque takes load off the driving wheels.

"(3) Radius rod effect: (a) With chains I believe this to be practically curable by adopting my relationship between sprockets and radius rod. (b) With propeller curable by two universals, one slide, and a proper parallelogram of distance rods.

"(4) Transmission: Part of the transmission often introduces an un-uniform conversion of speed—e. g., one universal joint (so does a chain, both in a small degree usually)

"(5) Weight causes bending of side walls, and therefore fatigue of tire. The drive of the engine transfers weight, say 100 pounds, to the back wheels, and adds to this effect. Unsprung weight on back axle causes heavy blows on the ground, the momentum of which adds further to this effect.

(6) Brakes cause skid and wear. The effect of applying the brake is unfortunately to take weight off back wheels. Unbalanced brakes: Loss of adhesion by applying brakes to only two wheels, thus doubling the wear on them.

(7) The differential, owing to its unfortunate property of turning the wheel with least adhesion."

Importance of Cylinder Temperature.

Cylinder temperature as a vital consideration to the efficient running of a gas engine, is seldom taken into account by the average motorist, at least to the degree that should be done. So long as the motor does not become hot enough to cause pre-ignition or cold enough to lose power, no further thought is given the matter. As a matter of fact, even comparatively small changes in the temperature of the jacket water may have considerable influence on both the power output and the fuel consumption, as is shown by the results of tests recently performed on a Napier engine for the purpose of proving just this point. The maximum power output and minimum fuel

consumption were developed with a jacket temperature of 149 degrees, Fahrenheit.

When the cooling water had been reduced to 115 degrees, the power fell away 3.64 per cent., while the consumption increased 4.8 per cent.; while with the water reduced to 56 degrees, the power dropped to 6.6 per cent, less than its maximum value. and the consumption rose to 11.5 per cent. above its minimum. Raising the temperature of the cooling water, instead of increasing the power and reducing the consumption, as might have been expected, produced just the reverse effect. At 185 degrees, the power had fallen away .66 per cent. of its original value, and the consumption had risen 1.38 per cent., while at 212 degrees, the power was still 1 per cent. less, and the consumption .55 per cent. greater. Temperature was the only available factor in this instance, as both load and speed were held constant. The values manifestly apply only to the motor in question, but the principle involved is an important one.

Automatic Chamferer for Gear Teeth.

It is only a short time, comparatively speaking, since even the advisability of chamfering the ends of gear teeth in automobile transmissions was considered open to discussion. Since the practice has become generally accepted, the method of developing this all essential little finishing touch has been left largely to that ancient retarder of mechanical processes-hand labor-or to such special devices as the ingenuity of the shop foreman might contrive. The result has been more or less unsatisfactory, ordinarily, and expensive as well, A thoroughly modern and expeditious attachment for performing this work rapidly and accurately and to any desired profile. has now been developed by the "Long Arm" System Co., Cleveland, O. It may be clamped to the table of a small milling machine and is absolutely automatic. It will handle gears of from 2 to 91/2 inch pitch, and of 4 to 10 diametral pitch, and when run at proper speeds, will chamfer about 12 teeth per minute. The attachment is fully described and illustrated in the "Long Arm" Co.'s Bulletin 25.

Driving Attachment for Buggy Wheels.

It would appear to be rather a difficult matter to attach a driving sprocket and brake drum to a common buggy wheel in such a way that it would be secure and durable, and it would prove quite as difficult a task as it appears unless just the right method were followed. The Cullman Wheel Co., Chicago. Ill., has developed a new method for effecting this attachment which is so important to the successful development of the modern high wheeled motor buggy, and a particularly simple one, too. Their counter shaft sprockets and differential gears which are designed for the same use are also an innovation in a very extensive line of sprocket and differential gearing.

TESTS OF TRUCK PERFORMANCE

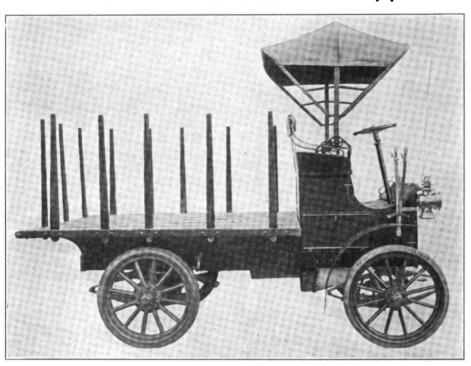

Results of Six Months' Practical and Experimental Service—Cost of Operation
Under Various Conditions.

With the commercial vehicle, unlike the pleasure car, the crucial point is performance, in contradistinction to mere power, weight, speed, wheel base, or appearance. From this standpoint, the construction of the Franklin "2,000-pound" truck, which, despite its name, has a rated capacity of 3,000 pounds, must be considered highly creditable as developed from the results of data gathered in the course of six months' use

wage item, this factor amounts to just about 83 cents. Whence the cost of operating the vehicle is worked down to 23/4 cents per ton mile.

As to hill-climbing performance, which, next to load carrying capacity and cost, is the most important item in the commercial vehicle catalogue, one of these machines, carrying a 3,000 pound load was driven up the hill leading out of the main gate of the factory, which is a 14½ per cent. grade, the Geddes street grade, which is of 11 per cent. pitch, and the Irving avenue grade of 12½ per cent. The James street hill, which is a grade of from 7 to 8 per cent., also was covered, and on second speed.

By way of an economy test, the same vehicle was run over city pavements for a

FRANKLIN TRUCK USED IN TESTS OF PERFORMANCE

of three of these little vehicles in and about the Syracuse (N. Y.) factory of the H. H. Franklin Mfg. Co. In this connection, it is to be observed that the running costs are higher than would otherwise be the case under similar road and mileage conditions, because the vehicles were used for experimental purposes frequently, which would tend to raise the cost of maintenance above its normal amount.

Lumping the performance of the three vehicles and averaging the result, the performance per vehicle worked out at an average of 10 trips per day, over 40 miles of road, with a load of 1.500 pounds, making a ton mile average of 30 per day. For this, the fuel consumption works out at 3.4 gallons, and the oil consumption at .22 gallons. Counting the driver's wages at the rate of \$1.87 per day, the average cost of haulage per day amounts to only \$2.70. This includes besides the driver's wages, the cost of fuel and oil, and the cost of time spent in repairing the machine. Exclusive of the

distance of 143/4 miles, encountering only one hill, and developing a consumption of 1.12 gallons of fuel, which represents an average of 19.7 ton-miles per gallon. Oil costs worked out at 66 ton-miles per quart. The average speed during the trial was 10.4 miles per hour. With a load of 4,000 pounds, the hill leading out of the main gate of the factory was again climbed successfully, as well as the entire length of the Geddes street hill. By way of an economy test, 91/8 miles of city pavement were covered with the same load, at the rate of 10 miles an hour and with a fuel consumption of 25% quarts, which is an average of 27.8 ton-miles per gallon. The oil consumption for this trip was only ½ pint, or at the rate of 73 ton-miles per quart consumed.

The 1908 Model J truck, with which these performances were made, is the light and compact little machine shown in the accompanying pieture. It is driven by the 16 horsepower four-cylinder, air-cooled motor, equipped with the famous concentric valves

which are a 1908 innovation in the Franklin line. Another feature which largely aids in its meritorious performance is the worm drive, which gives an unusually smooth transmission of power, with an astonishingly low friction loss. The wheels are 32 inches in diameter, shod with 2½-inch solid tires in front and 3-inch in the rear; the wheel base is 76 inches, and with the stake body shown, the platform area available is 60 by 72 inches.

Electrical Lubricator Telltale.

Safe to say the motorist does not live who at one time or another, has not been annoyed by the stoppage of the lubricating system of his car, and who would not welcome an infallible indication that the oil either is, or is not, flowing as it should. That the usual sight-feed glasses are weak in being useful only when there is sufficient light to observe them, is well known, but it required British ingenuity to devise the "Orleans" lubricator tell-tale, which has recently been placed on the market. Briefly, it consists of a small cylinder containing a piston, normally held at the lower end by iona spring, and serving as a regular connection between the lubricator and the bearings which it is intended to feed. In flowing through it, the pressure of the oil must raise the piston against the tension of its spring sufficiently for it to uncover a port in the cylinder wall: So long as the oil is flowing, the piston is kept part way up in the cylinder. As soon as the flow ceases, however, the piston descends to the bottom of the cylinder, while simultaneously contact is made between a finger carried by the piston rod and an insulated ring in the top of the device, whereby an electric circuit is closed and an alarm bell is rung, notifying the driver that something is wrong with the lubricator.

Big Mileage in Business Trips.

The family baking of many households in the eastern part of Long Island has been facilitated, it would appear, by what Michael Bruckner, of Riverhead, regards as the wonderful record of the Maxwell car with which his distribution of yeast is made. Bruckner has made his trips regularly during the past eight months in all sorts of weather, and over every variety of good, bad and indifferent roads. covering a total distance of more than 15,000 miles. He claims to have expended less than \$100 for repairs.

Economy of Horseless Fire Apparatus.

According to the fire commission of Springfield, Mass., the four automobile fire fighters in the department there, locally known as the "flying squadron," saves the city \$189.20 per year, as compared with the cost of horse equipment. The "commissioner therefore recommends the purchase of three combination chemical and hose automobiles to replace horse drawn apparatus, and expects to purchase additional chemical machines during the coming year.

HERDING CATTLE WITH MOTOR CARS

How Texas Cowboys Use Modern Methods in Their Business—Some of the Advantages that Result.

Having adopted the motor car for use in the ambulance service, police patrol, package delivery and nearly all other forms of transportation for people and inanimate objects it would seem that the field of usefulness for the gas engine was pretty well covered. But another industry has found that the motor vehicle is practical and advantageous and not a few automobiles are now used as a substitute for the cow pony for herding cattle.

THE MOTOR WORLD

come afforded by their farms. A recent victim has turned upon them, however, and a farmer named Hofmaier, who lives in the vicinity of Bamberg, is on trial this week for blackmailing no less a personage than Duke Francis Joseph of Bavaria.

The duke recently was driving an automobile in that neighborhood and the allegation against Hofmaier is that, seeing the duke's automobile approaching, he detached his horses from a farm wagon and purposely inflicted a serious wound upon the animal. When the duke came up, Hofmaier accused him of having run into his wagon and caused the injury to the horse. A crowd of about 100 peasants collected around the motor car, and refused to let the duke depart until he had paid over to Hofmaier all the money he had and promised to forward

COWBOYS AND THEIR MODERN EQUIPMENT

In the little town of Midland, in the heart of the cattle country of Texas, the men interested in the cattle industry are using motor cars in preference to horses. The collection of Mitchell automobiles shown in the illustration with the exception of three cars that belong respectively to a doctor, a banker and the sheriff, are the property of the cowboys and cattlemen.

In Texas a small ranch consists of about 2.000 acres, the others run up as high as several hundred thousand acres. These immense tracts of land are usually some distance from the towns and cities; the use of motor cars therefore is quite natural as the ordinary means of transportation between the ranches and the towns. But to use the power driven vehicle, in preference to the cow pony, when driving cattle, opens up an avenue of usefulness that was inconceivable a very few years ago. When gauntlets and goggles supplant spurs and a rawhide, another of America's picturesque institutions will have yielded to the onward march of commercialism and progress.

How Bavarians Blackmail Motorists.

Blackmailing automobilists is said to be one of the most popular among schemes whereby bucolic Bavarians eke out the inthe farmer \$40 beside. The duke related the incident to the prince regent of Bavaria, who advised him to bring suit against Hofmaier, as there was reason to believe this method of blackmailing was spreading.

Boston Restricts Official Motoring.

Though no accusation of "joy riding" has been made against Boston's fire chief, he has been ordered by the Fire Commissioner to use the automobile, furnished by the department, only for fires in the suburbs and "special occasions." The fire commissioner states that, while he personally is in favor of extending the use of automobiles in the department rather than curtailing their service, he must practice economy, hence the order. The department owns four automobiles, two used by the fire fighters, one by the commissioner and the other by the superintendent of repairs.

Mattoon Club's Annual Election.

At the annual meeting of the Automobile Club of Mattoon (III.) the following officers were elected: President, H. W. Clark; vice-president, F. E. Thatcher; secretary, George X. Chuse; treasurer, Dr. W. C. Lumpkin; directors, J. F. Chuse, Bert B. Cole, and E. B. Tucker.

MOTOR CARS IN ANTELOPE HUNTING

Montana Man Shows How It Can be Done

—The Fleet Animals Overtaken in

Long Chase.

"Look not mournfully into the past, it comes not again." The day has gone when "the speed of the antelope" will serve as an illustration of the greatest rapidity obtainable.

M. L. Wordman, a prominent citizen of Lewistown, Mont., an automobilist and a sportsman, recently conceived the idea of hunting the fleet antelope and using his National automobile in the chase. In company with a chauffeur he left his home town at about 8 o'clock one morning and started for a spring 65 miles away, where he thought the speedy animals would be found. Two hours later he arrived at his destination and after driving around for a few minutes he saw, with the aid of a powerful spy glass. a herd of about 25 antelope, lying down, five miles away.

The machine was headed toward the herd and as the country was almost level and the grass had been closely cropped by thousands of head of sheep he could easily distinguish all holes and stones at some distance away, and thus could safely drive at a high rate of speed. The car and its passengers were within a mile of the antelope when it was seen that they were becoming restless. Speed was diminished and another quarter of a mile was traveled when the group of fleet-footed animals took fright and bounded away with a speed that would have disheartened an ordinary hunter.

With slightly increased speed the automobile followed for a short distance, then the throttle was opened wide and the chase begun in earnest. Away went the pursued but far faster went the pursuers, and in two miles the gap between them was only 50 feet. Woodman raised his gun and fired, and although the car was going 35 miles an hour, an antelope dropped. The car was stopped long enough for him to take the wheel, then the chase was resumed. In a few minutes they had again caught up with their prey and the chauffeur took a shot. Another animal dropped, and as that was all that the Montana game laws allowed. the hunt was over.

When the dead antelope had been dressed they were loaded on the car. The homeward journey was completed by 4 o'clock in the afternoon, about 150 miles in all having been covered. Woodman says that this was the first hunt for big game in an automobile, and he adds. "but it is my intention to repeat it next year, having fully convinced myself that my National car can easily outrun an antelope, the fleetest animal to be found on the plains of the great West."

AUTOMOBILE AS SURGICAL AID

How It Made Possible a Major Operation and Saved a Life—Surgeon's Report of the Case.

Actual participation in a surgical operation, with the credit of assisting in the preservation of a human life is the most recent achievement credited to the automobile. W. B. Reid, M. D., of Rome, N. Y., tells the story in his report on a case of appendicitis furnished to the American Journal of Surgery.

Dr. Reid was summoned by telephone to consult with the family physician of Mr B., a farmer, and to operate, if necessary, in a case of suspected appendicitis. A run of fifteen miles in his automobile brought him to the patient's farm house about 6 o'clock in the evening. The professional history of the case up to that hour showed a rapid and alarming progress of a sudden attack of "cramps" in the stomach. Dr. Reid's diagnosis revealed what he describes as "acute appendicitis with perforation" and his advice in favor of an immediate operation was accepted. The kitchen was chosen as the operating room and the family "ironing board" was made to serve as an operating table.

"All of the country farm houses and many city homes have no other lights than oil lamps," Dr. Reid states in the beginning of his report, and he expresses his hope that the report may contain a suggestion helpful to anyone situated as he was, with a patient needing a major surgical operation, for which such light was inadequate, and whose condition would not permit of removal to suitable hospital surroundings. And here is where the automobile performed its part. It provided the necessary light. Dr. Reid says:

"The automobile was driven as close as practical to the kitchen window, the large searchlight lamp detached from the machine and passed into the kitchen. Rubber tubing ordinarily used for drainage was spliced by a glass drainage tube and used to connect the gas tank on the side of the automobile with the lamp in the kitchen surgery. The gas was then turned on, lighted, and the illumination found to be ideal. In fact, the light was just as good as in any well-appointed operating room."

After describing the operation, which was successfully performed, the patient eventually recovering, Dr. Reid concludes his report as follows:

"The pathological condition of the appendix, demonstrated at operation, suggests the probable outcome of the disease had we been obliged to have wasted time in his removal to a hospital. Next to the danger of time loss, we cannot but be impressed with the great danger in the mechanical disturbance of the parts in moving a pa-

tient in such a condition over rough country roads, which of necessity would tend not only to mechanically scatter the infection caused by the perforation, but by starting a peristalsis of the stomach and intestines, thereby also scatter the infection to such a degree as to cause general peritonitis.

"Next to the early diagnosis of the family physician and his prompt action, I feel that the automobile with its gas tank and lamp, was a strong factor in the means of saving the man's life."

Making a Mudhole Profitable.

Getting wealth out of holes in the ground is not confined to mining regions, for there are several reports of the somewhat rich yield certain New Jersey farmers are deriving from a mudhole on the Red Bank road a short distance this side of the intersecting road which leads to Matawan. Marshtown is the appropriate name of the little place nearest to the intersection, and conveniently located adjacent to the mudhole in question is a farm house. Several touring parties who made short trips through New Jersey on Sunday last returned to New York City with hard luck stories of muddy roads, and some of these parties had something to tell of this particular hole

It was noticed by the tourists that when their machines settled into the hole there came no offer of assistance from the farmer and several of his friends who complacently stood at the fence watching the vain efforts to get out of the difficulty. When asked to bring his team and help the travelers the farmer demanded \$5 for the work, which took but two minutes. This had to be paid, as the motorists were helpless and no other assistance was available for getting the car out of the mire.

There were four automobiles stalled at this place at noon Sunday, and it is said that a few days before four machines each paid \$8 for a few minutes' use of the team. There is some suspicion that the road at this place is kept in bad condition as a trap for automobiles.

Jerusalem Sees Its First Automobile.

Of the many wonders that the ancient city of Jerusalem has witnessed, the latest, and to the present denizens of that city the most wonderful, was presented in the advent of the first motor car ever seen there. Of course it was driven by that indefatigable collector of touring records and experiences—Charles J. Glidden, of Lowell, Mass. Accompanied by Mrs. Glidden, he reached Perusalem rfom Haifa, Syria, on Friday, 13th inst. The sight of the great modern vehicle created a sensation among the residents

"The A B C of Electricity" will aid you in understanding many things about motors that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

ARMED AUTOMOBILE IN REAL WAR

Practically Tested in French Rumpus in Morocco—Stood Strenuous Marches and Was an Effective Fighter.

What service the automobile might be able to render in war has been illustrated in a variety of ways in connection with military manoeuvers in our own country and abroad. What it can actually do under the stress of real war has been shown by a car engaged in the French rumpus in Morocco. This machine, says a foreign newspaper, is a Panhard, fitted with three quick-firing guns. It left Paris on December 9, last. Six days later it had progressed so far as to arrive at the scene of, and take part in, the most decisive engagement of the campaign—that at Ain Sfa, where its usefulness was such that its commander, Captain Genty (a well known French amateur racing motorist, by the way), has since been decorated with the Cross of the Legion of Honor, "for distinguished service in the Moroccan campaign."

This particular chassis was of standard type, 40 horsepower, with only normal clearance. Its facility of manoeuvering, therefore, must set at rest forever the pessimistic tongues so often protesting that "cars were all right on roads, but for use in the veldt or desert, or indeed on any broken ground, were quite impossible." The journey to the front of this mitrailleuse was sufficiently beset with trouble to form quite a test case. From a few hours after it left the ship nothing at all like a road could be used. Rivers had always to be forded, their banks in many cases having to be followed for miles before this was possible.

The land within a considerable distance of any African stream from the Nile downward is always of the most irregular character, and when once a stream was crossed the ground on the newly reached side would be found to bear miles of bowlders, sprinkled anyhow, so irregularly as to make mile-an-hour walking, or large stretches of cactus, whose "spines" were so assertive as to force even the wild animals to give such places a wide berth. Then would be met nine little 1-in-4 climbs, succeeded by stretches of feet-deep mud. Out of the quagmire a sandstorm would be encountered and the car so absolutely snowed up that she had to be dug out of the grit. The next incident, probably, would be the sinking of the car up to the clutch shaft in a desert bog. On the whole, it may be said with confidence that the ground covered could not have been more difficult to traverse, and the fact that the first of France's automobile machine guns was able to get up to and account for a number of the mobile Arabs has proved beyond all cavil its claim to recognition as a practicable unit of effective fighting strength.

FIFTY MILLIONS ASKED FOR ROADS

National Grange Gets Important Bill Before Congress—Plan for Highway Improvements in Every State.

Firty millions of dollars for the construction and maintenance of a national system of roads is the amount of assistance the farmers have asked of Congress, not for the benefit of any specified sections, nor in the interest of any special class, but for every section and for every class. Other efforts have been made in the past to secure the creation of some national commission under which the highway systems of the various States might be made productive of better results than thus far have been obtained, but they failed to command the support of the farmers, the largest class to whom the problem of good roads should appeal; and lacking this the bills introduced in Congress were suffered to die, in some cases because they were so worded as to give the impression that they were in behalf of some favored few.

Now, however, the farmers have taken the initiative, and the immense project for improved highways involved in a bill just introduced in Congress, has been formulated through careful discussion in the National Grange, the representative organization of the farmers, which, with more than a million members, is a power that may be relied upon to sway congressional opinion in a large degree. Especially is this the case in view of the fact that the farmer element has, in dealing with the matter, put itself in touch with all other interests to which the problem appeals, and through the active propagandism of such men as N. J. Batchelder, a former Governor of New Hampshire, has practically enlisted the sympathy and assured the co-operation of many other organizations throughout the country, representative of every class of people making use of. the roads. The bill which the National Grange has succeeded in placing before Congress will, if passed, inaugurate at an early date a broad and comprehensive policy of road improvement that will affect every portion of the United States. The full text of the bill is as follows:

A bill to provide for the creation of a National Highway Commission, and for the construction, improvement, and maintenance of public highways.

ance of public highways.

Section 1. Be it enacted by the Senate and House of Representatives of the United States of America in Congress assembled,

That this Act shall include within its provisions any and all public highways within the territory of the United States which, in the judgment of the Commission hereinafter created and constituted, might be constructed, improved, or maintained to promote interstate commerce and trade and the postal service of the United States.

Sec. 2. That a Commission is hereby

Sec. 2. That a Commission is hereby created to be called the "National Highway Commission," to consist of three Commissioners. The President of the Unted States

shall, by and with the advice and consent of the Senate, appoint three Commissioners, who shall have a practical knowledge of road building and construction. Any vacancy which may occur in the Commission shall in like manner be filled by the President; and he shall designate one of the Commissioners to be president of the Commission. Each of the Commissioners appointed shall receive as pay and compensation for his services five thousand dollars per annum. The Commissioners shall remain in office subject to removal by the President for inefficiency, neglect of duty, or malfeasance in office.

Sec. 3. That it shall be the duty of said Commission to take into consideration, formulate, and adopt such plan or plans for the improvement, construction, and maintenance of such public highways, the improvement, construction, and maintenance of which shall, in the judgment of the Commission, acting in co-operation and consultation as far as possible with the duly constituted authorities having charge of the construction and improvement of the public highways of the several States, promote and facilitate interstate commerce and trade and the postal service. The said Commission may, prior to the completion of all plans and surveys contemplated by this Act, proceed to such immediate work as in the judgment of said Commission may constitute a part of the general system of works herein contemplated.

Sec. 4. That it shall be the duty of said Commission to superintend and direct such works as are herein contemplated, and to carry into full execution such plan or plans for the construction, maintenance, and improvement of public highways as may be devised and adopted by the Commission as herein contemplated, and to make such additional surveys and investigations and mature such additional plan or plans and to carry the same into full execution as may be deemed necessary to construct, improve, and maintain a system of public highways, advantageous for the purposes of interstate commerce and trade and the postal service, and to accomplish the object of this Act.

Sec. 5. That the Commission herein constituted and appointed may cause proceedings to be instituted in the name of the United States in any court having jurisdiction of such proceedings for the acquirement by condemnation of any land, right of way, or material needed to enable it to maintain, operate, and prosecute works for the construction, maintenance, and improvement of public highways, for which provision has been made herein, and to construct. improve, and maintain such public high-ways. Such proceedings to be prosecuted in accordance with the laws relating to suits for the condemnation of property for a public purpose of the States wherein the pro-ceedings may be instituted: Provided, however, That when the owner of such land, right of way, or material shall fix a price for the same, which in the opinion of the Commission shall be reasonable, the said Commission may purchase the same without further delay; And provided further, That the said Commission is hereby authorized to accept donations of land, rights of way or material required for the rights of way, or material required for the maintenance and prosecution of such work.

Sec. 6. That there is hereby appropriated, out of any moneys in the Treasury of the United States not otherwise appropriated, for the purpose of carrying out the provisions and objects of this Act the sum of fifty million dollars. The sum of not less than five hundred thousand dollars out of such appropriation shall be expended in each State of the United States, said sum of five hundred thousand dollars to be expended in each State at the rate of not less

than one hundred thousand dollars a year. The said appropriation of fifty million dollars to be available at the rate of ten million dollars a year during the years nineteen hundred and eight, nineteen hundred and nine, nineteen hundred and ten. nineteen hundred and eleven, and nineteen hundred and twelve. If any of the appropriation herein made is not expended in the year named that portion not expended shall become available in the succeeding year or until expended.

Sec. 7. That the Commission herein created and constituted shall superintend, control, and expend for the purpose of this act all appropriations herein made, or which hereafter may be made for said purposes, or so much thereof as shall be necessary, and shall prepare and submit through the president of the Commission, to be by him transmitted to Congress at the beginning of the regular session in December of each year, a full and detailed report of all its proceedings and actions and of all such plans and systems of work as may be devised, in progress, or carried out by it, and of all such additional plans and systems of work as may be devised, ma-tured, and adopted by it, with full detailed estimates of the cost thereof, and a statement of all expenditures made by it; and the Secretary of War may detail from the corps of engineers, or other corps of the Army, an officer or officers to aid them in their work, who shall serve without additional compensation to that now allowed by law; and all moneys hereby or here-after appropriated shall be expended under the direction of the Commission in accordance with the plans, specifications, and recommendations formulated, matured, and adopted in accordance with the provisions of this Act.

City's Defense in Damage Suit.

Whether the city of New York can be multced for damages when any one is injured accidentally by officials engaged in the discharge of their duties is a question that will be determined in the disposal of a pending suit. Henry W. Scheeler has sued for \$20,000 damages, on account of the death of his wife, which resulted, it is alleged, from injuries inflicted by a Health Department automobile on December 6, 1906. The Corporation Counsel, in defense of the city, will allege that the Health Department is clothed with the authority of the State, and that the city cannot be held to financial account for the results of accidents attending the performance of public

Commercial Cars and Accidents.

In reckoning the number of accidents caused by automobiles it is not customary to distinguish between commercial and pleasure vehicles. For machines of the former type, the rate would naturally be expected to be very low. In Prussia, where this question has been taken up for the first time, so far as is known, returns covering the first half of the year 1907 showed that less than 1 per cent. of all automobile accidents were attributable to the agency of commercial vehicles. The motor vehicle registrations at that time showed about 25,000 passenger vehicles as against 1,112 freight machines.

The Week's Patents.

876,974. Piston. Harry A. Knox, Springfield, Mass. Filed Sept. 20, 1907. Serial No. 393,764.

1. A piston having a plurality of channels ond the head end thereof and extending inwards from the periphery thereof, the channels being arranged to register with the inlet ports at the end of the piston stroke.

876,978. Automobile Axle. Albert J. Lehman, Columbus, Ohio. Filed Sept. 27, 1907. Serial No. 394,788.

1. In an axle, the combination of the two tubes placed axially in line with each other, said tubes having gears affixed thereto at their inner or adjacent ends and stud shafts secured projectingly in their outer ends for the reception of the vehicle wheels, a bar loosely inclosed within the inner portion of said tubes adapted to hold said tubes in line and brace the axle from flexing at the middle, said bar provided with a spider, a gear on said spider to mesh with the said gears on the tube, and means whereby said spider may be driven.

877,083. Dust Shield for Self Moving Road Vehicles. John C. B. Ingleby, Leeds, England. Filed June 10, 1907. Serial No. 378,322.

1. A self moving road vehicle, provided with a dust screen consisting of a frame and a covering of fabric which is suspended below the bottom of said vehicle and serves to cut off the air between said screen and the ground from the air between said screen and the bottom of the vehicle body, sub-stantially as and for the purpose set forth.

Igniter. George J. Schultz, New York, N. Y., assignor to Benjamin Briscoe, Tarrytown, N. Y. Filed Jan. 24, 1907. Serial No. 353,770.

1. The combination with a casing in the form of a bushing for entering into an ignition chamber, a sparking point, a body of insulating material carrying said sparking point and of smaller radius than the radius of the inner wall of the casing, a plate of translucent material carried by said insulating material, and means for clamping said plate against the casing for affording a translucent closure for the space between the insulation and the casing.

877,136. Carburetter. Alfred C. Stewart, Los Angeles, Cal. Filed March 7, 1906. Serial No. 304.651.

1. A carburetter comprising an inner oil chamber provided with an inlet valve, a casing surrounding the oil chamber, an air inlet to said casing and provided with a valve seat, said oil chamber being provided with an outlet opening, a deflector above said outlet, and a valve surrounding the oil chamber and guided to move vertically in the casing and forming therewith and with the casing and forming therewith and with the oil chamber an air inlet chamber and a mixing chamber, said valve having a por-tion co-operating with said valve seat and a deflector portion co-operating with the aforesaid deflector, to vary the size of the air inlet opening into the mixing chamber, and the outlet from the mixing chamber in correspondence.

Speed Indicating Apparatus. 877,175. Sylvester C. De Fore, Kansas City, Mo., assignor to Standard Speedometer Company, a Corporation of Missouri. Filed Nov. 30, 1906. Serial No. 345,606.

1. In a speed indicating apparatus, the

THE MOTOR WORLD

Levallois-Perret, France, assignor to Societe de Constructions de Vehicles Automo-

combination with an indicating device, of a governor mechanism comprising a pair of jointed arms carrying weights, a base connecting the arms of said mechanism at one end, and having a recess in its inner surface, a shaft rigidly mounted at one end and having its loose end seated in said recess, a grooved collar carried by said shaft, and adapted for longitudinal but not for rotary movement, an arm connecting the other ends of said governor arms and adapted for revolution in the groove in said collar, a circuit terminal carried by said collar, a second terminal adjacent to and adapted for contact with said first terminal, and means for revolving said governor mechanism.

877,176. Speed Indicating Device. Sylvester C. De Fore, Kansas City, Mo., assignor to Standard Speedometer Company, a Corporation of Missouri. Filed May 11, 1907. Serial No. 373,136.

In a speed indicating device, the combination of a suitable casing provided with a scale, a bell, a raised bracket adjacent to said scale, and having a longitudinal slot therein, a contact head, a set screw extending through said slot, and supporting said head between the bracket and casing, a crank shaft, an indicator arm rigid on said shaft and projecting beneath said bracket, and means for completing a circuit through said indicator arm, and head to energize said bell, for the purpose set forth.

877,217. Wheel Rim Fastener. Ralph L. Morgan, Worcester, Mass. Filed Jan. 12, 1907. Serial No. 351,956.

1. The combination with an inner wheel rim having an elevated bearing surface, of an outer rim bearing near one side on said elevated surface, and a fastening device supporting the other side of the outer rim from the inner rim, said inner rim having means located between the rims and entirely at one side thereof for clamping the fastening device thereto.

877,233. Wheel for Motor Vehicles. George D. Ross, Glasgow, Scotland. Filed Dec. 28, 1906. Serial No. 349,764.

1. A wheel for motor vehicles comprising, in combination, two wheels, one arranged within the other, the inner one being a pneumatic tired wheel while the outer one consists of a wheel or ring having an internal diameter larger than the external diameter of the pneumatic tire of the inner wheel and being free to move relatively with said inner wheel, said plates on the outer wheel and bearings arranged between the inner wheel and said side plates, said bearings being provided with anti-friction metal.

877,234. Acetylene Generator. Samuel W. Rushmore, Plainfield, N. J. Filed May 27, 1905. Serial No. 262,583.

1. In an acetylene gas generator, the combination with a main inclosing case, of a calcium carbid basket unstably supported therein, and means arranged in the case to impart a sudden shock to the basket, said means being operated by the shocks or jars sustained by the generator.

877,260. Pneumatic Tire. Thomas B. Tiefenbacher, New York, N. Y. Filed March 16, 1907. Serial No. 362,679.

1. A pneumatic tire for automobiles and other vehicles, consisting of an air-tube, a covering sheath surrounding the same, a layer of felt interposed between the air tube and the sheath, a covering layer of elastic material, and a tread of felt secured permanently to the outer circumference of said layer.

877,267. Gearing. Robert de Valbreuze,

ciete de Constructions de Vehicles Automobiles, Levallois-Perret, France, a Corporation of France. Filed May 31, 1907. Serial No. 376,584.

1. A transmission gear for motor vehicles comprising a casing, a shaft extending therethrough, a square shaft surrounding

1. A transmission gear for motor vehicles comprising a casing, a shaft extending therethrough, a square shaft surrounding the driving shaft, a clutch member rotating with the driving shaft, a slidable clutch member mounted upon said square shaft and adapted to frictionally engage the other clutch member, a spring interposed between the shafts and bearing against said slidable clutching member, a counter shaft formed of two sections journaled in and extending through said casing, a differential gear mounted in the casing and connecting the sections of the countershaft together, a pair of gear wheels arranged within the casing and connected with the counter shaft, and a plurality of slidable pinions carried by the square shaft and adapted to engage with said gear wheels.

877,293. Gearing. Lucien Catel, Lyon, France. Filed March 29, 1907. Serial No. 365.275.

The combination of a stationary shaft, an oscillatory shaft connected to each end thereof and forming a continuation of the shaft, an arm connected to each oscillatory shaft, a rod connecting the arms together, a globular toothed wheel on each oscillatory shaft, and a pinion on a fixed axis meshing with each wheel.

877,294. Multiple Cylinder Engine. Frank L. Chase and Bertrand M. Young, Jamestown, N. Y.; said Young assignor to said Chase. Filed May 28, 1904. Serial No. 210, 1601/2.

1. In a multiple cylinder explosive engine, the combination with a crank shaft, of a plurality of pairs of aligned cylinders, the cylinders in each pair located on opposite sides of the crank shaft, reciprocating pistons located within said cylinders and operatively connected to the crank shaft, intake valves controlling the admission of motive fluid to the cylinders, exhaust valves unseating inwardly, stems on the exhaust valves projecting to the exterior of the valve casings, a cam shaft journaled adjacent the stems of the exhaust valves, cams on the cam shaft adapted to successively actuate the valve stems and unseat the exhaust valves, a longitudinal shaft extending at right angles to the cam shafts, beveled gears connecting the corresponding ends of the cam shafts to the ends of the longitudinal shaft, meshed spiral gears on said longitudinal shaft and the crank shaft, and means for adjusting said spiral gears to properly operate the cam shafts when the engine is reversed.

877,377. Starting Device for Explosion Engines with Four Cylinders. Hippolyt Saurer, Arbon, Switzerland. Original application filed Oct. 6, 1906. Serial No. 337,707. Divided and this application filed Sept. 14, 1907. Serial No. 392,913.

1. In a four stroke cycle explosion engine with four cylinders, the combination with four spring pressed inlet valves in the four cylinders, of a connection on the four cylinders above said four soring pressed inlet valves and comprising a cylindrical bore in its middle with four openings and four separate channels leading therefrom to the spring pressed inlet valves, and a rotary tubular distributing valve mounted to turn in the cylindrical bore of said connection and provided with two apertures and so driven as to make one revolution on every

two revolutions of the crank shaft, said connection being provided with two passages for each connecting two of the four channels.

877,405. Friction Clutch. Jules Caillet, Paris, France, assignor to Societe Anonyme des Automobiles Peugeot, Paris, France. Filed Sept. 10, 1907. Serial No. 392,127.

A friction clutch member comprising a clutch cone, semi-circular grooves provided on said cone and lying along elements of the sone surface, hollow india-rubber rods located in said grooves and slightly protruding beyond the circumferential surface of the cone, a leather envelope extended upon the cone surface and upon the protruding portions of the hollow india rubber rods, and small plates fixed to the cone opposite said rods to prevent same from slipping out their housings, substantially as described and for the purpose set forth.

877,437. Clutch. Charles B. King, Detroit, Mich., assignor to Northern Motor Car Company, Detroit, Mich., a Corporation of Michigan. Filed April 3, 1905. Serial No. 253,586.

1. In a clutch mechanism, the combination of a cylinder having one end closed, a flange fixed to the edge of said cylinder around its open end and extending part way to the center, a disc in said cylinder between said flange and the end of said cylinder, means for connecting said disc toward its center with the transmission mechanism, and means for supplying fluid under pressure to said cylinder back of said disc to press it against said flange to bind said disc and flange together for the purpose described.

877,438. Friction Driving Mechanism for Automobiles. John W. Lambert, Anderson, Ind. Filed Dec. 13, 1906, Serial No. 347,601. Renewed Sept. 6, 1907. Serial No. 391,702.

1. A friction driving mechanism comprising a friction disc, a driven friction disc, a rock shaft, means for moving said shaft, means connected to said shaft for bringing the driven disc into engagement with the friction disc, a pair of thrust wheels, means connecting said wheels to the rock-shaft whereby said thrust wheels will be brought into engagement with the friction disc on the opposite side thereof from the driven disc, and a stop device to limit the pressure of the thrust wheels on the friction disc without limiting the pressure of the driven disc on said friction disc.

877,471. Elastic Tire. Mathieu Brun. Lyon, France. Filed Sept. 27, 1906. Serial No. 336,430.

In a tire an elastic member comprising an outer part of elastic material externally smooth and having interior corrugations, an intermediate corrugated metallic resilient part whose corrugations engage those in the outer part, and an inner part of elastic material internally smooth and having exterior corrugations engaging those of the metallic part substantially as described.

877,512. Anti-Slipping Device for Tires. William T. Maxwell, Pittsburg, Pa., assignor of one-half to George W. Eberhardt. Pittsburg, Pa. Filed June 25th, 1906. Scrial No. 323,264.

1. An anti-slipping device for tires comprising in combination a series of securing means on the rim arranged alternately on opposite sides and in staggered relation, a chain member connected to each of said securing means and extending outwardly beyond the rim and ending in a hook, and a

continuous chain extending in zigzag manner over the tire face and having links thereof engaging said several hooks.

877,629. Pneumatic Wheel and Hub. Hamilton A. Brown, Lehigh, Iowa. Filed Nov. 1, 1906. Serial No. 342,150.

1. In an elastic wheel, a solid hub having a continuous concove groove in its periphery and anti-friction rollers on its side

faces, a solid circular frame having a continuous concave groove in its inner face, a pneumatic tube between the hub and the circular frame and the hub and the frame connected by circular plates fixed to the side faces of the circular frame and provided with openings for the purpose stated.

877,656. Spark Coil. August R. Luschka, Chicago, Ill., assignor to Motor Specialty

Manufacturing Company, Chicago, Ill., a Corporation of South Dakota. Filed Oct. 29, 1906. Serial No. 341,005. Renewed June 22, 1907. Serial No. 380,241.

1. In a spark coil of the type described, the combination of a secondary coil or winding, and a condenser arranged at the low tension or grounded end of said secondary coil

Self-Interest is the Most Practical Kind of Interest

It's the kind of interest that has led the leading top manufacturers to use Elutofoid instead of leather. Elutofoid isn't merely "just as good" as leather. It's better than perfect leather and comparatively little leather is perfect.

All Autofoid is perfect.

It's uniform in quality and size—no waste—and posssesses all the good qualities of leather without the imperfections of leather.

Elutofoid is a Twentieth Century development. It will amply repay anyone interested, to investigate it.

Nots That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, "07.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches, leaves the automobile with its original new lustre, without being sticky or greasy.

It can be used on the leather seats or tops with the very best results. Can be used on any color or kind of varnish, from the clearest white to the darkest black.

Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all automobile dealers. Price, 60 cents per bottle.

Catalog, largest of the kind, mailed on request.

FRANKLIN Automobiles

Is air-cooling practical? What does it do? What is the benefit?

Nobody ever questioned that if air-cooling will cool it is the ideal method. But the question still comes up "will it cool?" Look into that fairly—

Last August a Franklin Type D automobile ran from Chicago to New York in less than 40 hours, authing the water could record 18 hours, 50 minutes.

hours, cutting the water-cooled record 18 hours, 50 minutes.

A machine could not be "coddled" and make that record. It must be driven hard. In fact this Type D beat the express train that carried the relay drivers between three of the stops, else the record would have been cut still further.

The 15-day run of a Franklin Type H automobile from San Francisco to New York in August

two years ago is also still untouched.

The Franklin D engine ran 7 days without stopping, in a hot Chicago salesroom, and again at Cincinnati it ran 18 days, 3,312 miles, over bad winter roads. In this run the Franklin motor was kept going every minute and only stopped finally when the emergency brake was pulled by mistake.

Finally 5,328 Franklin automobiles are in daily use.

Can anyone doubt that Franklin air-cooling is completely practical?

You gain simplicity. Water-cooling is a complicated system. It increases the liability to trouble. If the water boils there will be over-heating. This can't happen to the Franklin motor. The temperature is more constant and more efficient. It gets more work out of the gasoline. You save the extra weight of water-cooling apparatus. The power is not handicapped. It can do more. And with the Franklin shock-absorbing construction the power can always be comfortably used. The operating expense is light; and you get all the benefit of it.

No other automobile weighing under 2000 pounds will do the work of the Franklin family touring-car Type G which weighs only 1600 pounds.

No automobile but a Franklin will carry people as far in a day and as comfortably as the Franklin 5-passenger Type D; yet it only weighs 2200 pounds. The average 5-passenger automobile weighs a third more.

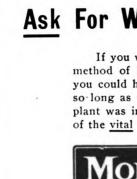

The 6-cylinder, 7-passenger Type H is the ablest and easiest touring-car in existence, yet it weighs only 2600 pounds—a thousand pounds less than the average 7-passenger automobile.

Doesn't the air-cooling question answer itself?

Write for the catalogue of Franklin models

Ask For What You Want When You Want It

If you were about to buy a house and the agent told you that the method of heating it was optional with you, and that for say \$500 you could have steam, hot water or hot air, would you tell him that so long as the price was the same it was immaterial what sort of a plant was installed? Not much! You'd specify. For heating is one of the vital things about a house.

MORGAN & WRIGHT TIRES

represent a similar vital part to an automobile. They probably have as much or more to do with a motorist's pleasure or annoyance as has any other one thing about his car. Then why not make sure of good tire equipment? Why not specify? Once you use Morgan & Wright tires (if only one or two in connection with other tires) for a few thousand miles, you will understand why we urge you to GET THE SPECIFYING HABIT.

There is no method of making friends equal to the method of making good.

) I L

Have you heard from Florida?

The single cylinder Cadillac driven by Dr. W. N. Stinson won the Jacksonville to Miami endurance run, 371 miles over some of the worst roads in the country, beating its closest competitor by 75 miles.

The other contestants were two and four cytinder cars

A telegraphic report from Palm Beach, Fla., under date of March 15th, and printed in the New York "Tribune" of March 16th, says:

"Nevertheless the route laid over a course that offered almost every kind of obstacle for a contest of its kind and the highest praise is deserving of the 10 H. P. Cadillac driven by Dr. W. N. Stinson, of Jacksonville, which came in first in the actual running time of 30 hours and 18 minutes."

The New York "Evening Post", under date of March 13th, prints the following telegram from Miami, Fla.:

"Miami, Fla., March 13.—Dr. William Stinson finished the Florida road race today at noon, fully seventy-five miles in advance of his nearest competitor. His official running time for the 371 miles was 37 hours 19 minutes; his actual running time being seven hours shorter. He drove a 10 horsepower Cadillac runabout, which carried three persons."

Cadillac Wins Three Prizes In One Contest

The New York "Globe" says, March 13:

"Dr. Stinson's Cadillac is in Class B, and wins the Fort Pierce cup, the first prize in this class, also the Palm Beach cup for the car in this class that made the fastest time between Fort Pierce and Palm Beach. The Miami trophy also goes to the Globe car (Cadillac) because it made the best all-round showing on the whole run, irrespective of power."

Cadillac Motor Car Co., Detroit, Mich.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

Clean Sweep for the White in California Hill Climb

The White Steamer won all three events in which it was entered in the hill-climbing carnival held at San Francisco in connection with the recent automobile show. A 30 H.P. White touring car won the class for cars costing up to \$3500, and a 20 H.P. White touring car won in the \$2500 class. In the free-for-all, the same 30 H.P. car, with body removed, again triumphed. It made the climb in 1:385, which is 16 seconds faster than that made by its nearest competitor.

The superiority of the White in hill-climbing has been demonstrated in every public contest in which it has competed or, more properly speaking, been allowed to compete. Hill-climbing ability is the true test of real power, of available power, of power at the rear wheels, and it is evident that hill-climbing contests furnish the real demonstration of what the various systems of motive power can do, and that the tables of "rated horse-power" are of purely theoretical interest.

Triumph Grease, What Is It?

It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. [We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. [It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. [A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. [It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. [Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

The Perfection Grease Company. South Bend, Ind.

CONTINENTAL MOTORS ARE STANDARD

Let us quote you on two and four cylinder motors. They are manufactured in our new factory equipped with modern machine tools and all parts made with special tools and jigs, therefore they are interchangeable. As It Was In The Beginning

Maxwell"

Car is now and (I promise) ever shall be an honest Car—honestly designed—conscientiously built—truthfully sold and in good faith backed up by its makers after it is in the hands of the buyer.

Times and conditions may change, but principles never do.

Maxwell principles of construction—chief among which are Thermo-syphon cooling; Unit Power Plant with three point suspension; and metal body,—are sound; all have been time-tried and road proven.

Here and there you'll find a maker who has adopted one or more of these Maxwell features, but only in Maxwell Cars do you find a combination of all of them.

I always feel sorry for the maker or sales manager who finds it necessary to contradict year after year all he has said previously, or who must devise new "talking points" to cover up past mistakes. I feel more sorry for the people who are beguiled into buying his cars.

Maxwell advertisements of four years ago expounded the same theories and principles as do those of 1908—and those of next year will be consistent with this. That's only one expression of Maxwell stability—it's one reason why Maxwell owners are such a contented lot.

Our catalog is free.

Rambler

Why the Offset Crank Shaft

One of the greatest improvements in motor construction is the offset crank shaft. Its advantages are positive and direct.

First—By practically eliminating the dead center the efficiency of the motor is greatly increased through the greater leverage and more direct thrust from piston to crank shaft.

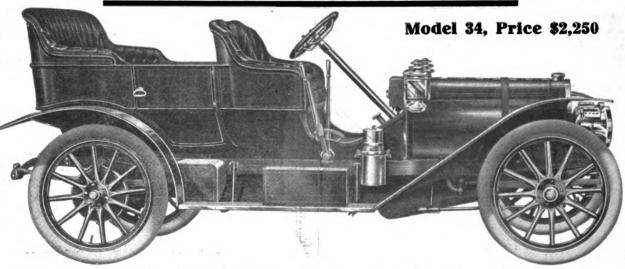

Second—Increased life of the motor through reduction of side thrust on cylinder walls and consequent saving in wear.

Third—Reduction in vibration and increased steadiness of running through more direct application of power generated in the cylinders.

Like many other fundamentally good features this must be done right and in the Rambler it is right both theoretically and practically and the result is a motor that combines the highest degree of efficieny with long life and economy of operation.

It is this and other features of equal value that make

The Car of Steady Service

This four cylinder chassis, equipped both as a 5-passenger touring car and 3-passenger roadster Price of each style \$2,250. The Rambler Utility Car with double opposed motor, \$1,400

WINTON WOULD MAKE DIRECT SALES

Issues a Suggestive Statement, but Leaves
His Attitude Toward Agents Open to
Considerable Speculation.

Reports are afloat that the Winton Motor Carriage Co. has abandoned the agency system and hereafter will deal direct with purchasers. They undoubtedly grow out of the company's recent announcements advising intending buyers that the surest way to obtain lasting satisfaction is to purchase from the manufacturers themselves, which advice has been printed in the form of advertisements and circular letters, many of which have found their way into Winton agents' territory. That many of the agents are considerably perturbed is not to be denied, but when Manager Churchill of the New York Winton branch was asked whether the announcements indicated that the company had broken away from agencies or whether they presaged a move of the sort, he said he was not in position to make reply.

"I have no information to that effect," he said. "The agents attached to this branch have not been disturbed and have expressed no dissatisfaction. Of course, we think pretty well of the branch house system, but more than that I cannot say. Definite information must be obtained from the factory."

Sales Manager Shanks already had issued a statement bearing on the subject in which while he unequivocally suggests the advantages of "patronizing the maker direct," he does not make plain whether the company has or intends to cut loose from agents. He says:

"A protest against our statements came to us the other day from a prominent dealer in Pittsburg, but, oddly enough, the protest itself rather supported our arguments. For this dealer, proclaiming that he is not among those dealers who frequently shift agencies, added that he had held a specified agency

three years. If an agency connection of three years is one of which a dealer may be proud (and it probably is), doesn't that alone serve to show that few agencies continue as long as three years? Any doubt that may exist on this point readily can be dispelled by reference to agency directories covering two or three years. It will be found that not two per cent of all the dealers in America are handling exactly the same lines now that they were in 1906—two years ago.

"To provide a remedy for this ill, the Winton company owns and operates its own branch houses in ten of America's greatest cities. These branches are devoted exclusively to Winton cars and are not subject to the shifting of agencies. It is the purpose of each branch to give Winton owners thorough and enthusiastic co-operation and satisfaction, not only when the car is new, but so long as the owner retains it, whether that be two years, or ten years, or more. And the buyer is best assured of such treatment when he patronizes the maker direct, for then he knows that the seller's interest and loyalty will be centered upon the same make in future years that it is to-day."

Hercules Tied up by an Injunction.

The Hartford Suspension Co., maker of the Truffault-Hartford shock absorbers, has been granted an injunction against the Motor Car Equipment Co., of New York, restraining it from manufacturing, selling or using the Hercules shock absorber, which the equipment company already had ceased to market. The injunction grows out of the suit brought by the Hartford company alleging infringement of its patents, No. 303,589.

White Company Opens Pittsburg Branch.

On April 1st, the White company will open a branch office in Pittsburg, having secured the new and commodious garage at 138-148 Beatty street, formerly occupied by the Liberty Automobile Co. William B. Yoder will be in charge of the branch; his territory will include the western counties of Pennsylvania.

POPE RECEIVERS ATTACKED ANEW

Toledo Interests File Second Petition for Their Removal—Both Cases to be Heard To-morrow.

Petitions inspired by the Toledo interests unfriendly to Albert L. Pope, and which seek to have him removed as receiver of the Pope Motor Car Co., are becoming so numerous that it soon will be difficult to keep count of them. In addition to the petitions to that end filed in the United States Circuit Court at Toledo last month, and in the United States court at Indianapolis only two weeks ago, a second petition was lodged with the court at Toledo on Friday last, 13th inst. The ostensible petitioners in the latter instance are the Northern National Bank of Toledo, the National Bank of Commerce and the Bostwick-Braun Co., of Toledo, and the Capital National Bank of Indianapolis, but the same attorney is the moving spirit in both cases. Indge Taylor set to-morrow, Friday, March 27th. as the time for a hearing on both motions. Receivers Pope and Yule and their attorneys are in Toledo and it is probable that the matter will be threshed to a finish. The day before the second Toledo petition was lodged, Albert L. Pope filed a claim for \$787,987.84 against the Pope Motor Car Co. and Judge Taylor appointed Irvin Belford a commissioner to investigate its validity.

The petitioners allege that they are creditors of the Pope Motor Car Co. in the sum of \$240,000, and that Receivers Pope and Yule are endeavoring to smother their claims by presenting a claim of the Pope Manufacturing Co.. the parent company, of Hartford, Conn., for \$800,000, in which both receivers, it is charged, are personally interested.

It is charged in the petition that the \$800,000 claim is irregular. In support of the allegation there is presented a statement of the Toledo concern's earnings for four years

from July 31, 1903, to July 31, 1907, which were \$1,904,000. This sum was increased by \$360,000 earnings from the Indianapolis plant, which is a part of the Pope Motor Car Co. In view of such earnings, the petitioners assert, no claim of \$800,000

could be made legally by the Pope Mfg. Co.

That A. L. Pope, together with his father, A. A. Pope, own more than a majority of the stock of the Pope Mfg. Co., on whose books is held the stock of the Toledo concern, is also set forth in the petition. For this reason the creditors demand the removal of the present receivers and the appointment of disinterested persons, although as a matter of fact, it is well known that the men behind the scenes are bent only on securing Pope's scalp; they have no real objection to Yule.

As in the first petition, it is also charged in the one filed on Friday last, that the creditors of the Toledo plant were denied a voice in the selection of receivers and that instances of partial administration justify their petition for new directors of the affairs of the Toledo plant.

The Week's Incorporations.

Wilmington, Del.—J. R. Richardson Auto Co., of Wilmington, under Delaware laws, with \$50,000 capital. Corporators not named.

Philadelphia, Pa.—Auburn Motor Car Co., under Delaware laws, with \$10,000 capital. Corporators not named.

Seattle, Wash—Sound Motor Co., under Washington laws, with \$8,000 capital. Corporators—Walter M. French, E. P. Frin, S. S. Munk.

Binghamton, N. Y.—H. B. Doherty Co., The, under New York laws, with \$5,000 capital; to manufacture motors. Corporators not named.

Chicago, Ill.—Pietsch Auto & Marine Co., under Illinois laws, with \$30,000 capital; to manufacture and deal in machinery. Corporators—L. W. Pietsch, O. E. Pietsch, C. J. Ward.

Jersey City. N. J.—Maxwell-Briscoe Export Co., The, under New Jersey laws, with \$50,000 capital; to manufacture motor vehicles. Corporators—Benjamin Briscoe, J. R. Turner, R. Irwin.

Fort Wayne, Ind.—Black Mfg. Co, The, under Indiana laws, with \$10,000 capital; to manufacture and sell automobiles and parts of automobiles. Corporators—Marion Black, A. L. Randall, Edward White, Donald Hayden.

New York City, N. Y.—Radio Battery Co., under New York laws, with \$100,000 capital, to manufacture and install batteries, storage batteries, etc. Corporators—R. B. Respess, H. L. Robinson, J. W. Kinne. New York City, N. Y.

Newark, N. J.—Automobile Co. of New Jersey, under New Jersey laws, with \$25,000 capital; to engage in the hire and sale of automobiles. Corporators—William V. Morgan and Silas Weston, Montelair. N. J.; Stanford Rogers, Glen Ridge, N. J.

THE MOTOR WORLD

In the Retail World.

E. H. McGibbon has had plans drawn for a large garage to be erected at Venice, Cal. It will be a two-story structure and will cost \$7,000.

James A. Quinn, of New York City, has set his bait for the seashore tire trade. He has rented for a term of three years the store at 77 Brighton avenue, West End, N. J., and will open on April 1st.

With G. L. Nickerson, J. S. Brown, and C. W. Sprague as its composition, the Nickerson Automobile Exchange has opened at 309 Fourteenth street, Washington, D. C. The firm will deal in second hand cars.

A. D. Perkins, a former dealer of Los Angeles, has returned to that city after conducting a manufacturing business in Portland, Ore., and has opened at 605-7-9 West Seventh street, as the Perkins Automobile Exchange. He will carry on a trade in second hand cars.

Harry J. Beebe and Charles Haigh, of Alpena, Mich., have formed a partnership and will open a garage in that place. They will do a general repair business and carry a large line of sundries, besides having the agency for several cars.

George E. Hume has been appointed receiver for the Boyd Automobile Co., of Indianapolis, on the petition of the Warner Instrument Co., and other creditors. The company claims to have assets of \$7,500 and liabilities of a lesser sum.

Cairo—in Illinois, not Egypt—has a new concern, the National Motor & Supply Co., which will handle the Olds motors and supplies. F. L. Harp, long connected with the Three States Implement & Buggy Co., of that city, is head of the new concern.

The New University Garage, at 166-168 St. John street, New Haven, Conn., has been purchased by Gardner E. Wheeler. This garage is unique in that automobiles are stored in separate "stalls," each provided with private lock and key.

The building on Lake street, Cadillac, Mich, formerly occupied by the Cadillac Machine Co., is being rebuilt for a garage. The name of the company has not been decided upon, but it is stated that it will have the agency for several well known cars. Wynter C. Massey will be in charge of the business.

All the machinery in the Redlands Auto Co.'s garage at Redlands, Cal., has been purchased by Robert Leith and J. C. Duncan, owners of the Casa Loma garage at the same place, and the repair business of the former will be transferred to the latter. J. L. Warner was associated with Leith and Duncan in the purchase.

Suit has been brought against P. F. Ryan of Schenectady, N. Y., to recover the proceeds of a car he sold for Mrs. Ada B. Mills of Lansingburgh. Mrs. Mills was to receive \$300 in case Ryan disposed of the car, and anything realized above that amount was to be his commission. It is alleged

that Ryan disposed of the car in exchange for another car and \$300 cash, but has paid nothing to Mrs. Mills as called for by the agreement.

The Columbus Auto Supply Co., with Cincinnati men as its backers, has been formed in Columbus, and has located at 342 South High street. This makes the first exclusive supply store in Columbus. The men interested in the venture are F. A. Cromley, F. P. Schopper, Jr., G. Schwendler, and W. R. Clark. The first named will manage the business.

W. E. Brown, proprietor of the Tippecanoe Automobile Co., Lafayette, Ind., has disposed of his interests to a company composed of Daniel J. Harrington, Edward J. Gallagher, John F. Ruger and Clarence Brown. The new concern will be known as the Lafayette Automobile Co., and will become incorporated under the laws of Indiana, with \$10,000 capital stock.

Several changes will be made along Newark's (N. J.) automobile "row" within the next few weeks. J. W. Mason will remove to his new building on Halsey street, near Marshall, and the present location at 289 Halsey will be occupied by a new firm. The F. E. Boland Co., which, by the way, will change its name, Boland having withdrawn from the company, his interests having been acquired by W. H. Weldon, will occupy a new building at Halsey street and Branford place. It will be a one-story structure, 50x60 feet. The Linkroum Automobile Co., which has been located at 17 Bank street, will occupy the building at 239 Halsey street, which will be vacated by the Boland company. Other changes are in prospect.

Conwell Succeeds to Lull's Position.

J. S. Conwell, who for the past year has been general northern representative for the Auto Vehicle Co. of Los Angeles, manufacturers of the Tourist car, has been appointed general manager of the company, with headquarters in Los Angeles. Conwell takes the place made vacant by the death of Lynn C. Lull, who passed away suddenly in Detroit several weeks ago.

To Manufacture a New Transmission.

The Black Mfg. Co., which has incorporated in Indiana with an authorized capital of \$10.000, and is located at Fort Wayne, will make a specialty of a transmission mechanism invented by Marion Black, one of the corporators. In addition, the company may manufacture and deal in automobiles and parts.

New Factory for Laman Tops.

The L. L. Laman Auto Top Co., Utica, N. Y., has moved its factory from 75 Lafayette street to the large building at 179 Blandina street. In its new location the company will have more than 30,000 square feet of floor space, considerably more room than was to be had in the old quarters.

BRISCOE NAMES THE COMMITTEES

Comparatively Few Changes in Personnel of A. M. C. M. A. Management—Smith Again Heads Show Committee.

With comparatively few changes in their makeup, Benjamin Briscoe, chairman of the committee of management of the American Motor Car Manufacturers' Association, has continued all of the committees that served during 1907.

The show committee, which always is an active one, will again have H. O. Smith, president of the Premier Motor Mfg. Co., as its chairman. Associated with him will be S. H. Mora of the Mora Motor Car Co., and R. M. Owen, of the Reo Motor Car Co. The other committees are as follows:

Tours and Races—W. C. Marmon, Nordyke & Marmon Co., chairman; H. O. Smith, Premier Motor Mfg. Co.; A. C. Newby, National Motor Vehicle Co.

Good Roads—Chas. E. Lewis, Jackson Automobile Co., chairman; James Couzens, Ford Motor Co.; R. E. Olds, Reo Motor Car Co.; H. B. Krenning, Dorris Motor Car Co.

Legislation—R. E. Olds, Reo Motor Car Co., chairman; C. G. Stoddard, Dayton Motor Car Co.; A. C. Newby, National Motor Vehicle Co.; R. A. Palmer, Motorcar Co.; R. E. Graham, Acme Motor Car Co.

Membership—W. H. Van Dervoort, Moline Automobile Co., chairman; Morris Grabowsky, Rapid Motor Vehicle Co.; E. K. Burroughs, Abendroth & Root Mfg. Co.

Advertising and Publicity—Barney F. Everitt, Wayne Automobile Co., chairman; Harry Fosdick, Moon Motor Car Co.; G. B. Louderback, Buckeye Mfg. Co.; Theo. P. Bailey, St. Louis Car Co.; Leon Myron Bradley, New York office; Charles E. Duryea, New York office.

Finance—James Couzens, Ford Motor Co., chairman; W. G. Morse, Atlas Motor Car Co.; J. B. Bartholomew, The Bartholomew Co.

Standardization and Technical—John D. Maxwell, Maxwell-Briscoe Motor Co.; Henry Ford. Ford Motor Co.; R. S. Crawford, Crawford Automobile Co.; L. P. Mooers, Moon Motor Car Co.; R. E. Olds, Reo Motor Car Co.

Freight and Transportation—Harry A. Knox, Atlas Motor Car Co., chairman; H. W. Mack, Mack Bros. Motor Car Co.; R. Harry Croninger, Pennsylvania Auto-Motor Co.; J. N. Willys, Overland Auto Co.; G. D. Wilcox, Gearless Transmission Co.; C. C. Hanch, Nordyke & Marmon Co.

Tires—G. V. Rogers, Mitchell Motor Car Co., chairman; James Couzens, Ford Motor Co.; Frank Briscoe, Brush Runabout Co.; O. Stevenson, York Motor Car Co.

Agencies-W. H. Van Dervoort, Moline

Automobile Co., chairman; A. R. Welch, Welch Motor Car Co.; H. S. Leyman, De-Luxe Motor Car Co.; Frank L. Pierce, Gaeth Automobile Co.; H. B. Larzelere, Chadwick Engineering Works.

Many Judgments Against Archer & Co.

Three judgments, aggregating \$13,742, were entered on Saturday last against Archer & Co., Inc., who formerly did business at 1597 Broadway, New York, in favor of Walter B. Manny, on three notes of the corporation, made on December 27. 1907, payable at the Oriental Bank, which were not paid. The notes were indorsed by Allison M. Archer, president of the company, and the judgments are also against him. The corporation gave up business some time ago. During the past several months the sheriff has received eight executions, aggregating \$7,270, against it, but found nothing to levy upon. The corporation was organized about 18 months ago with a capital stock of \$10,000, and handled the Hotchkiss car, which agency the Hotchkiss Import Co. recently took over.

Dragon is in the Legal Toils.

On petition of John C. Calhoun, whose claim is for \$2,400, money loaned, the Equitable Trust Co. and Samuel C. Myers have been appointed receivers for the Dragon Motor Car Co., Philadelphia, the company assenting to the receivership, but denying insolvency. The J. G. Brill Co., whose former car shops were rented to the Dragon people for a factory, also have made a levy on the company. It appears that even the Dragon Automobile Co., which was the style of the concern before its recent reorganization, had not paid its rent for five mosths.

A. C. A. Opens Supply Store.

The Automobile Club of America has embarked in the supply business, a store having been established on the third floor of the big club house on West Fifty-fourth street, New York, in which a complete stock of tires and accessories will be carried. In the announcement of the opening of the store, members of the club are promised "a large discount from current market prices on all supplies."

Receivers to Continue E. V. Business.

Judge Shumway, sitting in the Superior Court at Hartford, Conn., last week issued an order empowering the receivers, Halsey M. Barrett and Henry W. Nuckols, to continue the business of the Electric Vehicle Co. As compensation for their services, he also authorized the receivers to pay themselves \$900 each, on account.

Mansuay Goes from Fisk to White.

Louis M. Mansuay, for the past four years assistant manager of the Fisk Rubber Co.'s New York branch, has resigned that position to take up with the White Co.'s New York store. His change will become effective April 1st.

DURYEA PLANT WAS SOLD TWICE

"Insufficient Funds" Nullifies First Sale and Middleby Then Bids \$10,000 Less —Will Operate the Factory.

The real estate and machinery of the bankrupt Duryea Power Co., Reading, Pa., has been sold to Joseph W. Middleby, Jr., for \$15,000.

On Tuesday of last week the plant was offered for sale. The bidding was quite spirited between D. Lipman, of New York City, and Mr. Middleby, who is a resident of Malden, Mass. The latter bid up to \$25,200, and Mr. Lipman bid to \$25,250, the plant being declared sold to him.

When he tendered a check for 10 per cent. of the purchase price, it was ignored at the bank on account of lack of funds, and the trustee again offered the plant for sale on Wednesday morning. Mr. Middleby was the only bidder this time and the trustee declared him the purchaser at his price, \$15,000.

Mr. Middleby, it is said, will conduct a new company, and will continue the manufacture of automobiles. Ruring the week 11 automobiles, also several lathes and tools were sold.

The purchasers of the automobiles were as follows: M. M. Thew, New Jersey, \$390; Dr. Francis F. Brobst, Reading, \$385; Dr. L. H. Moss, Massachusetts, \$375; James McClellan, New Jersey, \$390; H. W. Limbaugh, Harrisburg, \$355; E. L. Sturgis, \$350; C. F. Fister, New Jersey, \$340; Joseph W. Middleby, Reading, bought four machines for \$330, \$355, \$380 and \$250, respectively. The latter is a second class machine.

Charles E. Duryea is preparing to engage in the manufacture of motor buggies. That enduring pioneer long has had unbounded faith in the future of that type of vehicles and proposes to "show his faith by his works."

To Make Buggies in California.

N. M. and Fred Anderson, of Los Angeles, Cal., are making arrangements for the manufacture of motor buggies in that city. They already have built one vehicle, which incorporates several original features, and which was recently put to the test in a long tour through Southern California and Mexico.

Chadwick Completes Move to Pottstown.

The Chadwick Engineering Co. have completed their removal from Philadelphia to Pottstown, Pa. They now are in full possession of the huge new factory which was erected for them at the latter place.

Earl Makes Big Increase of Capital.

The Earl Motor Car Co., Kenosha, Wis., has increased its capital stock to \$350,000; previously it was but \$25.000.

"Keep Your Eye On Continentals!"

Continental Tires Win Long Island Endurance Contest!

Frayer-Miller Car, Winner of Contest, Equipped with Continental Tires.

A COMPETITOR'S CLAIMS:

Long Island Endurance Contest

Thirteen of the 21 cars used Diamond casings and tubes. Highest competing make equipped 3 cars. Contest won on Diamonds. Plenty of tire trouble all told but not with Diamond tires.

What the Frayer-Miller Company says:

New York, Feb. 26, 1908.

MR. J. B. COTHRAN,

Continental Caoutchouc Co., 43 Warren St., City.

My Dear Mr. Cothran:-

We wish to congratulate you on the way the Continental Tires (with which our car, the winning Frayer-Miller was equipped in the Long Island Automobile Club's Economy Contest) stood up over the 242 miles of this run, under the worst road conditions, the roads being frozen and having deep ruts in them which invited continual danger to our tires.

Our car carried five heavy passengers and we did not have a puncture or a blow-out, and in fact did not touch our tires during the entire run.

We did not even think it necessary to carry an extra shoe.

Wishing you continued success, we beg to remain,

Very truly yours,

FRAYER-MILLER COMPANY,

(Signed by) H. H. Knepper, Manager.

VICTORIES FOR CONTINENTAL TIRES

At Ormond, Florida, in March, "Automobile Club of America Cup"; Winning Car "FIAT," Second Car "CHRISTIE," both on Continental Tires. The leading car continued and made a world's long distance racing record, 300 miles, 233 minutes, 44 seconds, 77 miles an hour.

Also, "Minneapolis International World's Championship Trophy." won by the "FIAT" on Continental Tires; and competitive mile record, standing start; amateur mile record; and the world's middle weight mile record, 35 seconds flat.

NEW YORK, MARCH 26, 1908

Suggestiveness of the Savannah Race.

The marked success of the big stock car race in Savannah is suggestive of many wholesome truths and points to a more wholesome state of sport. The truths are plain enough and strong enough to make it advisable to toll the knell of the so-called racing car, which is but another term for the "freak" car, which is dangerous to man and beast and of no practical earthly use.

The even, consistent performance of the cars in the Sayannah race, the fact that all save one, which had met with an undistressing accident, were in the running at the conclusion of the contest, and that the tires gave a good account of themselves, constitute a bright page in the history of the sport, while the crowd in evidence and the interest created is evidence that "freak" cars are not necessary to arouse and attract the public.

Trophies that serve such useful ends and that promote such sport, achieve more real

and lasting and far reaching benefits, serve more practical purposes, and teach more practical lessons, and save more lives than all the Vanderbilt cups which may be offered for the encouragement of "freaks."

The A. A. A. should not permit the lesson to go to waste. Now that it is showing a disposition to give heed to its disinterested supporters and well wishers it should go further in the same direction by adopting a limit for competition that would relegate the "freaks" to where they belong—the scrap heap. And having adopted a limit, the A. A. A. should hold fast to it and not do as was done for one of the races at Savannah, i. e., stretch the limit in order to oblige a splendid gentleman whose car was a trifle over the dimensions originally fixed.

The governing motorcycle organization had dared to adopt a limit and to hold unswervingly to it, and the manufacturers forced to keep within that limit, have done so. It has encouraged practical design, has killed the "freak" and saved the manufacturers themselves no small amount of money. What the motorcycle body has done, the A. A. A. should do, and it can do it if it so wills, and is not thrown off its balance by "too much Vanderbilt cup."

Promoting Utilitarian Uses.

What is reckoned one of the most important uses of the small runabout and light touring car, if not its most important use, is the utilitarian service which it performs for the physician and the business man who is in need of frequent and important journevs over comparatively short distances. The needs of the country doctor, are usually cited as typical in this respect, but they are by no means the only instances in which the requirement is imperative, for transportation such as the light and economical motor car is capable of providing. Obviously, it is to the best interest of both manufacturer and dealer to foster and protect this section of the market, which besides being a voluminous and intelligent one, possesses the desirable feature of absolute and consistent stability.

There can be no question that the manufacturers have done a great deal in catering to this branch of the field, nor that they appreciate its importance. It is open to discussion, however, whether the average agent is exerting himself to his utmost to develop all the business that is latent in this quarter. A successful continuance of the exploitation which already has gained such

a good footing depends quite as much upon the wise handling of the repair business as upon the booming of new types or new models of old ones. This consideration demands the attention of the dealer most strongly.

It is essential that the man who uses a motor car because he requires its services rather than because he inclines to it as a pastime, be taught to get the most work out of it with the least possible expenditure of time and money. He must be taught how to keep his car in service all the time; how to have it ready to answer the instant's demand, whether by day or night; and how to reduce his expenses to their lowest terms. This principle may tend to reduce the repairman's income from any one customer. The chances are that it will not work out in that way ultimately, however, since customers who are so treated usually continue as customers to the end of all time, and form the best possible advertisement of which a business can boast.

In this connection, it may be a lesson'can be learned from the methods of the watchmaker, who invariably has a watch to lend for every reputable watch brought in for repairs. Carried to extremes, such a practice would be ruinous to the automobile repairer. But in the case of men who must have their cars for daily service, it would be profitable for the repairman to have a substitute machine or two, such as always are to be found about almost any garage. and which could be put into service temporarily pending the release of the owner's machine from the shop. All things considered, the cost of such a policy would be comparatively slight, particularly if the wear and tear of the substitute machine were covered by a nominal rental figure. But even reckoned at a moderate cost to the repairman, the return would be sufficiently great, measured in the confidence and security of the customer's patronage, to well repay the small outlay.

Problem of the Commercial Vehicle.

It is difficult to appreciate the importance of the wise and conservative development of the commercial yehicle for handling heavy loads over long hauls. The utility motor vehicle is slower in coming into its own that the pleasure vehicle has been, though not slower, perhaps, than is to its own best interests. Its leisurely development up to this time, has been sufficiently unspectacular to escape the notice of unscrupulous and shyster promoters, so that

it is largely true, that what has been done for the commercial vehicle, has been done earnestly and with the wise purpose of furthering its ultimate growth to the highest possible degrée. Yet uninteresting though the type may be, from the standpoint of present worth in the monetary sense, it offers a field for endeavor and a prospect for

future usefulness such, that no thinking man

in the industry can afford to overlook its

specific properties and the difficulties which

block its evolution.

One of the most important phases of the problem, and one which is destined beyond a doubt to become a very large factor in its ultimate success, is that of the road train. Primarily, it may be, the idea in itself is unattractive, because it implies a blocking of the highways with huge, slow-moving vehicles, and because the need for it is not apparent. The absolute necessity of transporting large volumes of freight at low costs, however, coupled with the existing limitations to the increase in carrying capacity of the single vehicle, which are daily becoming more apparent, make the road train the only really plausible solution of the problem. What considerations lead to this conclusion, are set forth in another column. Suffice it to say in this connection, that they are sufficient, and that from the results of actual service, it has been proved already, that the road train is not the unmanageable and unprofitable proposition a casual glance at its properties makes it appear.

Briefly recounted, the advantages of the road train are these: The carrying capacity of the train may be largely proportional to the demand of the paying load, since ordinarily, only as many trailers need be used, as are required for the load; the service is more economical in its nature because of the possibility in many cases of working the tractor on practically full time, doubling or trebling the number of trailers, and providing for simultaneous loading and hauling of the full equipment; more economical maintenance, since the disability of one or more trailers need not lay up the entire system; better road service, since the traction is distributed over the whole train-in the more advanced systems-so that a slough of greater length than the train is required in order to mire it; the practical elimination of skidding for the same reason; reduced wear on the road and reduced wheel and driving gear wear, by virtue of load and traction distribution; and the me-

THE MOTOR WORLD

chanical economy which comes with the concentration of the power plant in the largest possible units.

There are many ways in which regular service for road trains might be established with profit, where the use of individual motor vehicles could not be made to pay. The principle involved is merely that of handling the load on a wholesale basis, and on a large scale, instead of on the retail plan. The man with only enough business to support one truck is not always able to run that on a paying basis, because he cannot afford sufficient "plant" to reduce his maintenance cost. The man or group of men, with sufficient business to support a half dozen trucks, or, what is the same thing, one efficient tractor and four or five trailers, can well afford to pay for the expert attendance, surplus equipment for substitute service, a small repair shop, and repairs.

The profits from railroading are greatest, generally speaking, where the greatest volume of business is handled. Even without actual knowledge in the matter, it would be safe to assume that commercial motor haulage would yield returns somewhat on the same plan. That the bulk of railroad earnings come from freight transportation, suggests an extension of the parallel which is too obvious to be overlooked.

Inconsistency of Frelinghuysen.

Why do not the New Jerseymen who are waging war on Frelinghuysenism touch the author of the jug handled justice, which is implied by that term, on the spot where he is weakest? Senator Frelinghuysen is not a resident of New Jersey. His office and his home both are in New York and long have been. In other words, and in political parlance, Frelinghuysen is, from the New Jersey standpoint, a carpetbagger. As he thus is a non-resident lawmaker, the Jerseymen have additional cause for offense, while New Yorkers also have reason for increased objection that one of their own number should, for political effect, force them to pay tribute to New Jersey while he is free to use their roads without let, hindrance or cost. The wise warriors always seek out the weakest point of their opponents and keep hammering at it. The keynote for the campaign against Frelinghuysenism is plain.

Encouraging the Private Owner.

Suggested in a jocular vein, it is stated that the New Jersey Automobile and Motor

COMING EVENTS

March 15-April 1, Omaha, Neb.—Omaha Automobile Dealers' Association's annual show in the Auditorium.

March 23-28, Indianapolis, Ind.—Indianapolis Automobile Dealers' Association's show week.

March 31-April 4, Salt Lake City, Utah—Automobile show in Auditorium skating rink.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 6, 7 and 8, Denver, Col.—Annual show in Mammoth skating rink.

April 6-11, New York City—New York Automobile Trade Association's carnival week.

April 11, San Francisco—California Automobile Dealers' Association's hill climb.

April 16-18, Memphis, Tenn.—Automobile show promoted by the Automobile Dealers' Association of Memphis, in the Auditorium.

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

May 5-6, Harrisburg, Pa.—Motor Club of Harrisburg's second annual endurance run.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

Club has given an earnest turn to the suggestion and probably will conduct an endurance contest for private owners only. It is to be hoped that the club will do that very thing. It is to be hoped that every other club promoting a road contest will do likewise, at least to the extent of including a class for private owners in each event. There should be a class of the sort in the Glidden tour. The private owner can be made to give an enduring complexion to such sport-can be made to make it smack more of sport and less of the "trade game." Automobile competition has been so thoroughly saturated with business interests that it is almost waterlogged from the standpoint of sport. No effort has been made to encourage the private owner. It now may prove too late, but on the principle that it is better late than never, it is well worth trying. Up to the present time, the owner has been wet-blanketed.

FRELINGHUYSEN TO CUT THE FEE

New Jersey Senator Abandons His High Tariff — Evidence that He is a "Carpet-bagger."

Senator Frelinghuysen has "come down." As a result of an informal discussion with other New Jersey senators he has advised W. C. Crosby, chairman of the New Jersey Automobile and Motor Club's legislative committee, that "the feeling is that the license fee should be raised to \$3 for cars under 10 horsepower, \$5 for from 10 to 30 horsepower, and \$10 for any above that figure, and the drivers' fee should be raised to \$2 and \$4, no tourist privilege, the manufacturers' one to five cars at \$5 per annum."

"In his new bill Frelinghuysen sought to raise the registration fees on a sliding scale -\$3 for cars of 10 horsepower or less, \$5 for cars of 20 horsepower or less, and upjumps of \$5 for each additional 10 horsepower. At present the fees are \$3 for less than 30 horsepower, and \$5 for cars of greater power. Frelinghuysen also outlined an increase in the cost of drivers' licenses from \$1 and \$2, respectively, up to \$25. He also proposed to abolish the blanket license for manufacturers and dealers which costs \$20. The extent of his "come down" is therefore of considerable magnitude. Mr. Crosby states, however, that the New Jersey automobilists are not satisfied. If any increase whatever is to be made, he thinks an increase of the speed limit or privileges to tourists or non-residents should be accorded in return.

Senator Frelinghuysen's letter to Mr. Crosby advising him of the "feeling" of his fellow senators supplies an interesting sidelight on the manner in which even New Jersey legislators transact their State affairs in New York-and without paying a fee for the privilege. Like Frelinghuysen, Crosby earns his living in New York City. Crosby, however, actually has a home in New Jersey, while the New York telephone directory gives the residential dress of Joseph S. Frelinghuysen as 35 West Sixty-eighth street. Inquiry discloses that it is the home of Senator Joseph S. Frelinghuysen-of New Jersey-the same who framed the existing law and who so stoutly insisted and insists that non-residents chiefly New Yorkers, pay an "admission fee' to enter New Jersey. Incidentally New Jerseymen, are accorded non-resident privileges in New York. For political purposes, Frelinghuysen has a letterhead which bears "Raritan, N. J." as his address. His letter to Mr. Crosby ostensibly was written and dated from that point, but for once the crafty senator missed his cue. The letter was addressed to Crosby at "755 Water street, City." If anyone asked for Water street in Raritan, N. J., he probably would cause the oldest inhabitant to scratch his head until he was freed of even suspicion of hayseed. For Water street is in New York City.

In political circles the man who resides in one State and holds political office in another State is termed a "carpet-bagger."

Asks Congress for Motor Volunteers.

The Automobile Club of Maryland is anxious not only that its own State but the Federal government recognize the automobile as an instrument for fight as already it is generally recognized as a vehicle for frolic. To that end Delegate Carr has introduced a joint recolution in the Maryland legislature calling upon Congress of the United States to adopt measures for the promotion of the use of automobiles in warfare. It was referred to the committee on Federal Relations. Later Mr. Carr offered a bill designed to permit the organization of a volunteer motor corps as a part of the State militia. In pursuance of the plan Representative Talbot of Maryland, on Monday last, offered in the House the petition from the Automobile Club of Maryland for the passage of an act by Congress creating a body to be known as "the volunteer motor corps" throughout the country as part of the regularly organized militia of the sev-

Canadian Compounds a Queer Bill.

If the bill just introduced into the Canadian parliament by Mr. Bowman should by any chance become a law, the use of automobiles will become a delightful pastime. The measure provides that no motor vehicle shall be allowed to run or stand upon any public highway in any municipality, excepting in a city, between 7 in the morning and 9 o'clock in the evening of Saturdays, and between 7 in the morning and 3 in the afternoon of Sundays. It also seeks to require that persons having control of motor vehicles when meeting a horse outside city or town limits are to stop at least 100 yards distant, and shall not proceed or allow the motor to operate until the horse or horses are safely passed.

Three More Clubs in New York.

The Peekskill Automobile Club and the Automobile Club of Ulster Co. have joined the New York State Automobile Association, making 43 clubs now on the roll. The Automobile Club of Mount Vernon, which was organized on Thursday last with William Adams as president, and F. A. Kately, secretary, also will affiliate with the A. A. A. State organization.

Can't Bar Child Drivers in Florida.

Judge Call, sitting in the Circuit Court of Florida, has declared "unreasonable and void" that part of the Jacksonville ordinance which prohibited children under 16 years from driving automobiles. The point was raised on an appeal in the case of Jack McMillan, who was convicted in a lower court.

STANDING START FOR HILL CLIMB

Plans Revised for the Fort George Contest of Carnival Week—Eleven Events on the Schedule.

Following a meeting of the hill climbing committee, Colonel K. C. Pardee, the chairman, announced a rearrangement of the classification and conditions of the Fort George hill climb to be held in conjunction with the New York Automobile Trade Carnival during the week of April 6. The climb will take place on Thursday afternoon, April 9th.

The contest will be open to stock cars under the price classification schedule of the A. A. A., and for the first time the climb will be from a standing start, in order to eliminate any possible chance of an accident such as took place at the last climb, when a car struck the subway pillar which occupies a part of the roadway near the foot of the grade and leaves but a narrow opening.

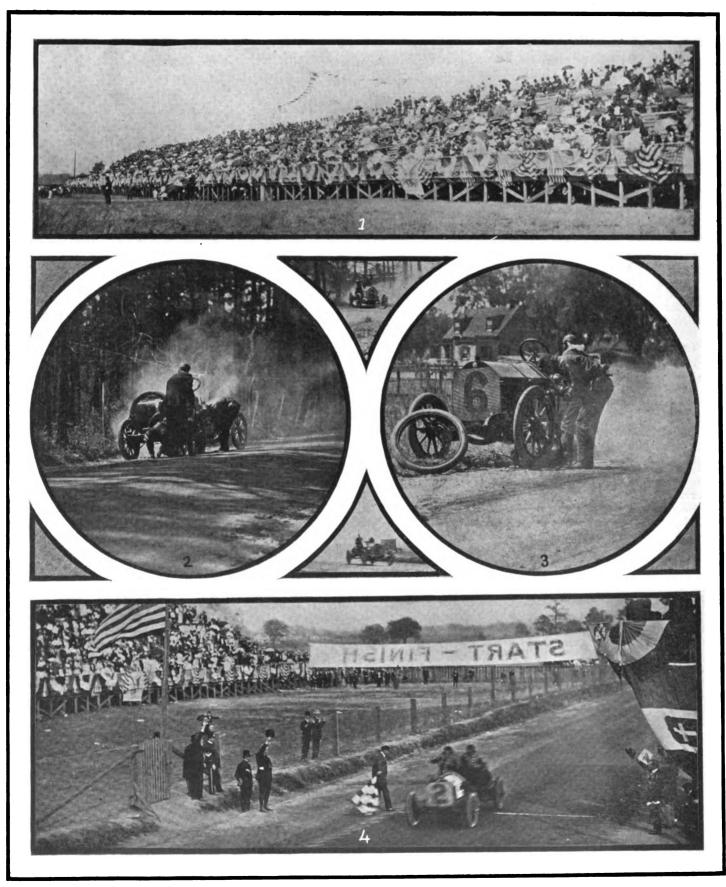

Blanks can be obtained from and entries will close with Colonel K. C. Pardee, No. 317 West Fifty-ninth street, on Monday April 6. The entry fee in each event will be \$10, or for non-subscribers to the carnival fund, \$110. Following is a list of the events:

1. Gasolene cars selling for \$850 or less.
2. Gasolene cars selling from \$850 to and including \$1,250.
3. Gasolene cars selling from \$1,251 to and including \$2,000.
4. All gasolene cars selling from \$2,000 to and including \$3,000.
5. Either steam, gasolene or electric cars selling from \$2,001 to \$3,000.
6. Gasolene cars selling from \$3,001 to and including \$4,000.
7. Gasolene four-cylinder cars selling for over \$4,000.
8. Six-cylinder cars, selling for over \$4,000.
9. Free-for-all, cars of all motive power.
10. Steam cars only.
11. Electrics of all types.

Native Cubans Try Road Racing.

Native Cubans, negroes and resident Havanians witnessed some exciting races at the Cuban capital on Thursday last, 19th inst. The race for runabouts from 25 to 50 horsepower, was won by Aspuro, who drove a Winton over the course, 2,610 metres (1. 2 miles) in 2:113/5. Damasco Laine finished first in the event for cars under 25 horsepower, his time being 2:33, while Mario Carvajal was the victor in the class for cars up to 50 horsepower. Time, 2:003/5. Honore Laine finished first in the class for touring cars between 25 and 50 horsepower, his time being 2:21. Antony Colas won a similar event for professionals in 2:15. The Havana cup was won by Alfara and the Lucha award was won by de Bustamante, who made the best time over the kilometre. Each competing car was fully equipped and carried its full complement of passengers. The events aroused considerable interest.

3. DITTO POOLE.

4. STRANG ACCLAIMED THE VICTOR.

SAVANNAH SETS NEW STANDARD FOR SPORT

Big Race For Stock Cars Proves That Freaks Are Not Necessary For Success—Strang Scores a Notable Victory
But Consistent Performance Is The Rule—Governor Hoke Smith Presents
The Victor—Every Detail Well Executed.

- 1. ONE OF THE DIAMOND TIRE CAMPS.
- 3. GUARDING THE COURSE.

- 2. LYTLE ROUNDING THE ISLE OF HOPE TURN.
- 4. McCULLOGH AFTER BRING DITCHED.

The balance turned at Savannah, Ga., on Thursday last, 19th inst., the second day of the two days' road race carnival for stock cars, under the auspices of the Savannah Automobile Club. The "big" race very much more than redeemed the partial fiascos of the day before.

Despite a disappointing first day, when two 180 miles races were held, in one of which but two cars finished and in the other one car, the second day brought out the first long distance road race for stock chassis held in America, and produced the finest sport ever witnessed in a long distance road race in this country. It was distinctly Vanderbiltian and a little bit more.

In a few seconds more than a quarter of a chronological day Lewis Strang jumped from the minor position of an understudy to the exalted position of one of the best race drivers in the country, by piloting a 50 horsepower Italian Isotta-Fraschini car over 20 laps of the 17.1 miles level oiled course in the fast time of 6 hours 21 minutes 30 seconds. Strang has for several years been a mechanic for and once-in-a-great-while substitute for Walter Christie. The total distance was 342 miles, making his speed average 53.83 miles an hour.

A few minutes behind Strang finished Herbert H. Lytle, well known as a Vanberbilt cup race driver, in a 50 horsepower Apperson car. Lytle's time was 6:44:37, and Malcolm Newstetter, a hitherto unknown, in a six-cylinder Acme car, finished a close third in 6:47:05. Two minutes after him came H. A. Michener, in a Lozier car, and Al Poole, known as Joe Tracy's mechanic, driving a counterpart of the winning car, was fifth. Poole made the fastest lap of the race, covering the second in 15 minutes 53 seconds, a speed better than a mile a minute. When the race officially was declared over two cars still were in the running-the Stearns, driven by Frank Leland, and the American, piloted by Fred Tone. Only one of the eight cars was put out of the running and that through no fault of its mechanism, but through an error of judgment on the part of the driver who attempted to take a dangerous turn too fast and who overturned in consequence.

The feature of the race was the remarkably consistent performance of all the competing stock cars, and the service given by the tires. The Isotta-Fraschini was fitted with Michelin and the Apperson with Diamond tires, and on neither car was it necessary to replace a tire throughout the race, something unprecedented in long distance events.

The arrangements were perfect and enthusiasm bubbled over in true Southern fashion. While it is impossible to accurately estimate the crowds that saw the race, a fair guess numbers the attendance at 50,000. The crowd was most dense, of course, at the grandstand, where 5,000 persons sat for six hours in a broiling sun, while the parking spaces held automobiles filled with persons in holiday attire. Both sides of the road were lined with spectators, two and three deep, while the Thunderbolt and the Isle of Hope turns held great crowds. Despite the crowds, not an accident happened to one of the spectators, due to the excellent military patrol in command of Major W. B. Stevens. The service of the military organizations, performed willingly without compensation, reflects the whole spirit of Savannah in regard to the meet. Seven hours' patrol duty with loaded rifles was a fatiguing task. The presence of the soldiers and naval reserves had its effect in preserving order and keeping the course clear. Only one incident is recorded where individuals attempted to cross the course in violation of orders from the patrol guards, and after one shot had been fired over the heads of the three men who disregarded the warning, and another bullet ploughed up the sand in front of them, the men quickly halted and were placed under arrest.

The course presented an animated appearance, and the presence of the picturesque Diamond tire camps around the circuit, and the directing banners indicating the turns and angles, gave it the aspect of a Vanderbilt cup course. The city of Savannah was deserted while the race was in progress. Practically all the business houses and even the schools had closed, and the only people left in town were the negro porters and bell boys in the insufficient number of ho-

* McCullogh overturned at Isle of Hope turn.

† Leland and Tone were still running when the race officially was declared over. Tone's total ti

tels, a few policemen, firemen and street car conductors. Every other Savannahian was somewhere on the course.

Although Georgia is a prohibition State it did not follow that all of the spectators went dry. Most of the hampers carried in the automobiles contained "ginger ale," which is known in Georgia as "prohibition beer," or something stronger, while it is even recorded that several automobiles carried on a thriving trade as itinerant bars. The presence of Governor Hoke Smith, Mayor Tiedeman of Savannah, and other State and municipal dignitaries did not apparently curtail the brisk trade.

ONE OF THE SUPPLY STATIONS

Three hours before the race started the crowd began to fill grandstand, parking places and other points of vantage and when Lytle, in the Apperson, got the word at 10 o'clock, the grandstand occupants rose to their feet and gave him a cheer. Lytle got away without incident and was soon lost to sight up the oiled White Bluff road. Ninety seconds later Strang, in the Italian car, took the signal, and the others got away at the same intervals. Fred Tone, in the American, was third, and Michener, in the gray painted Lozier, which had been dubbed King Cotton, breasted the tape next. Clad entirely in white, while from the tops of their tightly fitting headgear defiantly floated white streamers, Michener and his mecanicien presented a striking picture as they awaited the signal. The "King Cotton" lost several seconds at the tape. William McCullogh, in the ill-fated Apperson was fifth away, and then followed Al Poole, in the other Italian car; Poole was the favorite. Frank Leland, driving the Stearns car, the only machine entered by a Savannahian, was seventh, and Newstetter, the dark horse, in the Acme "six" started last.

The first news received by telephone at

the stand came a few minutes after Newstetter left. It was to the effect that the American car had shed a tire on the first turn. Strang passed Lytle on the first lap and led at the end of the first 17.2 miles, covered in 17 minutes 50 seconds, with Lytle second in 18:35. The second round passed with Strang still in the lead and opening a gap on Lytle, while Poole, Strang's team mate, simply burned up the roads and almost overhauled McCullogh, who had left before him. Poole's fast driving in this lap scored for him the fastest lap in the race, the 17.1 miles circuit being covered in 15:53.

It was in the third lap that McCullogh came to grief. He attempted to pass Poole on the sharp left handed turn after leaving the Isle of Hope, and took it too fast. Neither the driver nor Wray, his mechanic, was injured when the car overturned, but the steering wheel was broken, and that put it out of the running, although later a temporary repair was made and the car returned to Savannah under its own power.

Poole had hard luck. After being in the lead for a part of the time and holding second place from the tenth to the fourteenth laps, he was compelled to drop back to fifth position on account of tire and other troubles. Lytle also had some trouble with a broken oil pipe. He dropped from second position to fifth and it was not until after the tenth lap that he got actually in the running again. When he did, Lytle made the most remarkable run of the race. Hard luck spoiled the chances of the American and the Stearns cars early in the race. The former cast a shoe after being in the race less than six minutes. Another followed at the Isle of Hope and a third at the turn into the homestretch in the next round. An oil flooded clutch also added to Tone's discomfiture, while Leland was beset by a series of mishaps. He drove by the stand twice with one tire missing, and in the seventh lap ran through a barbed wire fence. He lost much valuable time each lap in plugging up the leak in the radiator caused by the sharp barbs.

The run of Michener's Lozier for the first eight laps is worthy of note, as it reeled off lap after lap with a maximum variation of only 19 seconds, while two circuits, the third and fourth laps, were made in exactly the same time to the second. The performance was again repeated in the 12th and 13th laps.

27	47:07	22:23	47:10	22:20	27:02	22:23	22:42	22:51	İ					

for 15 laps was 6:36:30, and Leland's 6:45:24.

Trailed by the Lozier and by his own team mate, Strang began to pull away and kept his lead through the seventh lap, only to drop it to Michener in the next. In the 9th lap, however, Strang made a fast spurt and again regained the lead, which he retained from then until the finish.

At the end of the 10th lap, with the race

in the 17th lap when Lytle passed Poole after a neck and neck dash past the tape.

When it became known that Strang practically had won the race he slowed down in the last three laps. On the last lap he came down the homestretch between two lines of cheers, smiling and with one hand in the air. Lytle followed and was greeted

more pleased when the Governor himself pinned upon his coat a gold medal at the veritable love feast which followed in the evening.

At the shore dinner given by the local club in the evening a lot was said about Savannah's chance for landing the next Vanderbilt cup race, and even Jefferson De Mont Thompson, chairman of the cup commission, who refereed, said that next to his own State (New York) he was in favor of Savannah. Medals also were presented to Lytle, who won the runabout race on Wednesday in an Apperson car and to Salzman (Thomas-Detroit) the only finisher in the stock car race, on Wednesday. The supper was the occasion for felicitation on all sides, and the guests passed a resolution thanking the American Automobile Association for its service, the manufacturers, photographers, newspaper men and

GOV. HOKE SMITH DELIVERING HIS ADDRESS; STRANG ON HIS RIGHT

half over, Strang led Poole by 7 minutes, with Michener three minutes behind. Newstetter was fourth, Lytle fifth and Leland sixth. Tone was last. It was at this point that Lytle began his remarkable run that landed him ultimately in second place. With the exception of the 16th lap not one of the succeeding rounds was covered in more than twenty minutes. Poole had carburetter trouble in the 11th lap. In the 18th lap Strang came up to Poole and seeing him under the machine, slowed up to ask the trouble.

"Never mind me," yelled Poole. "Go on; you've got the race won!"

While Poole dropped back Lytle climbed steadily forward. His heady driving in the closing laps of the race manifested itself to the spectators. In the 15th lap he passed Tone after an exciting brush past the grand-stand which brought the crowd to its feet, and a few minutes later overhauled Poole. The crowd in the stands got another thrill

even more tumultuously than was Strang. The most spectacular finish was made by Newstetter in the Acme, when he dashed down the last stretch at a speed of 75 miles an hour, after a great run in which he snatched third place from Michener. After Poole had finished, the race was declared over.

Possibly it was the proudest moment in Lewis Strang's life when, after winning the race and a leg on the \$3,000 challenge trophy that went with the victory, Governor Hoke Smith presented him and his mechanic to the grandstand audience. After complimenting the management of the race and commenting upon the great sport the Governor said:

"While it was a foreign car that won this race it had to be driven by an American citizen to win. We appreciate superb machinery, but we place manhood first of all." Strang smiled when the Governor presented him as the "hero of the day," and seemed

everybody else. The only dry feature of the supper was that the menu "suffered" considerably on account of Georgia being a prohibition State. Even this harshness was softened somewhat by referring to cocktails as "your choice of soft drinks," and substituting "prohibition beer" (ginger ale) instead of wine, while rye (bread) and soda (crackers) took the place of the genuine articles. "Black coffee for sobering" and "Sham pain on Ice (water), topped off the menu, with a satirical "Too bad—isn't it," as a final flourish.

Although no official figures have yet been given out, it is thought that the two days' meet will be an "even break," so far as finances are concerned. Including the building of the big grandstand, parking stalls, fences, and so forth, and oiling the race course, the meet cost the Savannah executive committee approximately \$15,000. It is thought that the receipts will about meet this expense.

CANADA FLOCKS TO TORONTO SHOW

Many Cars Staged and Leading American Makers Among the Exhibitors—Railroads Display Active Interest.

With a total of 66 exhibitors, more than half of whom display cars, Canada's annual automobile, motor boat and sportsmen's show opened in the St. Lawrence arena, Toronto, Saturday night last, 21st inst. This year's exhibition is attracting more notice than former shows as the various railroads are taking an active interest to the extent of exhibiting and offering single rates from all parts of Ontario to Toronto. Because of the railroad excursion rates many visitors from outside points have been attracted to the show, more than five hundred certificates having been presented for redemption the first day. The show is held under the auspices of the Ontario Motor League, which has a membership upwards of 400. Among the exhibitors are:

Ford Motor Co., Automobile & Supply Co., Dominion Automobile Co., Oldsmobile Co. of Canada, Canada Cycle & Motor Co., Hyslop Bros., Ltd., McLaughlin Motor Car Co., George N. Pierce & Co., Pickard Motor Car Co., Maxwell-Briscoe Motor Co., Cadillac Motor Car Co., Mitchell Motor Car Co., Stevens-Durvea Co., Dayton Motor Car Co., Darracq Motor Co., Studebaker Bros. Co. of New York, Renault Freres, Napier S. F. Edge, Ltd., Ferro Machine & Foundry Co., S. F. Bowser & Co., Diamond Rubber Co., Dunlop Tire & Rubber Goods Co., Canadian Puncture Proof Tire Co., George A. Haw, Premier Motor Co., Randall-Faichney Co., Auto Igniter Co., Roberts Motor Co., International Carriage Co., Motz Tire Co., Reo Motor Car Co., Comet Motor Car Co., Winton Motor Carriage Co., Kissel Motor Car Co., Premier Motor Mfg. Co., and Royal Motor Car Co.

Debut of Native Car at Omaha.

The third annual show of the Omaha Automobile Association, held in the Auditorium, Omaha, Thursday, Friday and Saturday last, 19th, 20th and 21st insts., brought out one new car, the only one manufactured in Nebraska. The Fuller, as it is called, is a four-cylinder water cooled machine, employing friction transmission and shaft drive, and is made by the Angus Automobile Co. of Angus, Neb. The other cars on exhibition are: Franklin, Pilain, Delahaye, Moline, Columbus, Buick, Reo, Holsman, Oldsmobile, Maxwell, Stanley, Stevens-Duryea, Babcock Oakland White, Stoddard-Dayton, Ford, Pope-Hartford and Jackson.

Fresno "Society" at Dealers' Show.

For a town with so few dealers and by the same token a limited number of agencies, the first show held by the six dealers

THE MOTOR WORLD

of Fresno, Cal., March 12, 13 and 14, was an ambitious effort. In all there are eight dealers in the inland town, but as only members of the newly organized Fresno Automobile Dealers' Association were allowed to exhibit, the show was limited to six exhibitors of cars. The opening night was termed "Society Night," when the dealers charged one dollar admission and 'got away with it," too. The cars shonw were: White, Maxwell, Oldsmobile, Buick, Pierce-Arrow, Tourist, Mitchell, Elmore, Locomobile, Ford, Reo, Rambler.

New Haven Show Well Attended.

Despite stormy weather the annual show of the New Haven (Conn.) Automobile Dealers' Association opened in Music Hall that city Wednesday night last, 18th inst., with a large crowd in attendance. The show continued all week, one day's receipts being given to the poor of the city. The hall was tastefully decorated with flags, bunting and potted plants, more than 150 of the last named being distributed about the room. Neither the Maxwell nor the Stoddard-Dayton cars were shown, as Harry B. Tuttle, the local agent, could not secure sufficient space. In consequence he rented two stores on the main floor of a building a few doors west of Music Hall where he held open house all week. The cars shown in Music Hall were: Locomobile, Apperson, Clement-Bayard, Pope-Waverly, Franklin, Stevens-Duryea, Buick, Babcock, Studebaker, Cadillac, Oldsmobile, Reo, White, Corbin, Thomas, Atlas Compound Schaet and Pope-Toledo.

Utica Man Wins Franklin's Prize.

The solid gold 21 jewel watch offered by the H. H. Franklin Mfg. Co., as a prize for the Franklin agent who submitted the best ten reasons why an automobile buyer should select the Franklin, has just been awarded to Irving R. Gardinier, superintendent of the automobile department of C. H. Child & Co., Utica, N. Y.

The contest lasted for four weeks, 57 contestants taking part. Their ten reasons varied in length from 10 words to 2,500 words. All were carefully examined by a committee consisting of H. H. Franklin, president of the company; John Wilkinson, chief engineer, and F. R. Bump, sales manager.

Thomas on Taxicab Mission to Pacific.

E. L. Thomas, of the E. R. Thomas Motor Co., is on the Pacific coast chiefly on taxicab business. It is stated that he had organized a cab service in San Francisco and that a similar project is under way in Los Angeles.

Automobile Show for Salt Lake City.

Salt Lake City is to have an automobile show in Auditorium roller skating rink in that city. It will open on March 31 and continue through the week, closing April 4.

WALKER WESTON AT ROCHESTER

Aged Pedestrian an Exhibit of Great Interest at Local Show—The Cars that Were in Evidence.

With Edward Payson Weston, the venerable pedestrian, who surprised the world by walking from Boston to Chicago some time ago in record-breaking time, is the feature exhibit the Rochester Automobile Club held its first annual show in Convention Hall, Rochester, N. Y., Wednesday, Thursday, Friday and Saturday of last week, March 18th to 25th inclusive. None of the crudity usually attendant to first attempts was manifested at the Rochester club's exhibition. The electrical display was well worked out. Because of the limited floor area the placing of the exhibits on the ground floor necessitated a systematic arrangement. In the center of the hall was a large rectangle, with an aisle for spectators around each of its four sides, and another bisecting it at right angles. Through the center of the rectangle was a line of white Corinthian columns with an arch surmounting the dividing aisle. Each of the columns had at its top a cluster of electric bulbs, while wires of suspended bulbs ran diagonally from the center to the corners. Green and white, the club's colors, were displayed lavishly, but in pleasing harmony. Weston, the pedestrian, was the feature of the Gearless exhibit, a car of this make having accompanied him on a part of his long march to Chicago last year. Among the cars displayed were the following:

Gearless, Thomas Flyer, Thomas-Detroit, Columbia, Elmore, Packard, Jackson, Mitchell, Maxwell, Stoddard-Dayton, Pierce-Arrow, Stevens-Duryea, Locomobile, Selden, Pope-Waverly, National, Earl, Jewel, Buick, Peerless, Corbin, Aerocar, American, R. & L., Lambert, and Holsman.

Another Car for Street Cleaners.

The Department of Street Cleaning of New York has obtained permission from the Board of Aldermen to purchase, without public letting, an automobile to cost not over \$3,500. Last December, Dr. Bensel. at that time street cleaning commissioner. notified the sinking fund commissioners that the department had more automobiles that were required for its needs; the result was that a Lozier touring car was transferred from the street cleaning to the health department. Now, however, that the snow has gone and the pleasant days and evenings of summer are approaching, the need of another car is sadly felt, so the Lozier company have been directed to furnish another of their touring cars. The car to be furnished has been carefully and particularly selected, and according to some reports is likely to prove an object of considerable interest.

AMERICAN ENTRY REACHES 'FRISCO

Thomas Car Completes First Leg of New York-Paris "Race" in 42 Days—Foreign Contenders Still Tinkering.

With Harold Brinker at the wheel, the Thomas car, the only American entry in the New York-Paris "race," rolled into San Francisco on Tuesday last, 24th inst., and it is expected that it will be shipped by boat to Alaska to-morrow or the next day. The voyage across the American continent had occupied 42 days. The "race" started from 'New York, February 12. and while it has proven rather amusing as a race, it has been

tackle and brawn to extricate it. The total delay amounted to some 40 hours. Immediately afterward, the party experienced a bitter disappointment in the refusal of the railroad officials to grant the Italians the use of the Aspen tunnel, and the right of way over the Piedmont Mountains, which has been permitted the Thomas. An attempt was made to construe this into an affair of international importance. But upon the explanation of the officials that the passage of the American car had so cut up the ballast that it had been necessary to go over it completely in order to put the road into serviceable condition once more, the matter was allowed to pass under protest. The services of the obliging railroad company were again called into requisition on spoiled the Franco-German speed contest which had been anticipated. Laramie, Wyo., was reached on Sunday evening after a strenuous run of 57 miles. The car is now reported to be within 100 miles of the De Dion, at Green River, Wyo.

Clubs Choose New Officers.

The following officers were elected at the annual meeting of the Norristown (Pa.) Automobile Club: President, John E. Mountain; vice-president, B. Frank Stritzinger; secretary, Edwin S. Nice; treasurer, Louis E. Taubel; directors, F. M. Jacquith, R. A. Jackson, Harry A. Wlison, and F. B. Wildman

Dr. S. T. Davis was re-elected president of the Lancaster (Pa.) Automobile Club at

THOMAS CAR WITH BRINKER AT WHEEL BUMPING OVER THE TIES IN UTAH

a strenuous struggle that has tested both men and machines. Of the six starters, two quit—the Sizarre-Naudin, which lasted only 96 miles, and the Motobloc, which was entrained at Omaha.

An accident, variously reported as affecting the differential, the steering gear and the driving gear, had delayed the Thomas at Stone Cabin, between Ely and Goldfield, Neb., on Thursday. Extra parts had to be brought out from Tonopah, 57 miles distant, and the incident delayed Goldfield's celebration of the arrival of the only American contestant. By Saturday, Beatty, Nev., was reached, when, instead of taking the proposed route over the Santa Fe and San Pedro lines, Brinker followed the shorter and more mountainous route to Mojave, Cal., and so to Bakersfield, which was reached after forced runs, day and night, on Sunday. Fresno was left behind on Monday, and the 100 mile run into San Francisco accomplished the following day without incident.

A mud hole west of Church Bluffs, Wy., held the Zust car in its clutches all of Thursday night, and until a Union Pacific work train had been side tracked on Friday, long enough for its crew to lend sufficient

Monday, however, when, only a few miles beyond Kelton, Utah, the car came to grief, and returned to face a long delay. In this emergency, a special train was supplied to take the car back to Ogden, where the U. P. shops were thrown open to it for the third time. It was re-shipped to Kelton, and again took the road Wednesday afternoon.

Undergoing the usual difficulties, the De Dion car got as far as Rock Springs, Wyo., on Monday, and there became mired outside the town. In warping it out of its berth, something went wrong with the tackle, and St. Chaffrey's right hand was injured. Press despatches under his own signature later stated that the hurt was so great as to impair his driving ability, and that he would probably be forced to give over the management of the expedition to Autran, so soon as San Francisco is reached.

Thursday of last week, the Protos car came near overtaking the De Dion at Lexington, Neb., which was reached only about four hours after the departure of the French entry. A delay pending the arrival of some much-needed tires, which had been sent to Seattle for Alaskan duty, but re-requisitioned for service in the States, however,

the annual meeting last wek. The other officers elected were: Vice-president, Martin Kinports, Ephrata; treasurer, Dr. P. P. Breneman, Lancaster; secretary, J. D. Rider, Lancaster; directors, H. M. Hillegas, Columbia; Dr. J. F. Trexler, Lancaster, and H. C. Shock, Mount Joy.

The Automobile Club of Cincinnati has elected the following officers for the ensuing year; President, Dr. C. L. Bonifield; first vice-president, C. Gordon Neff; second Jr., C. E. Bultman, Paul Cerkamp, Dr. A. Dr. L. S. Colter; treasurer, Harry L. Manss; consulting engineer, E. J. Carpenter; board of governors, G. W. Drach, Val Dittenhofer, Jr., C. E. Bultman, Paul Verkamp, Dr. A. B. Heyl and Louis Merkle. The club has a membership of 242.

Will Again Climb Sport Hill.

The Automobile Club of Bridgeport, Conn., will, as usual, hold its annual hill climbing contest on Memorial Day. This announcement was made last week after a conference with the selectmen of Easton, who agreed to allow the club the use of Sport Hill at that place on the morning of May 30th. Rules and classes will be announced later.

KING CARNIVAL AT INDIANAPOLIS

Dealers Hold Open House for the Week— Exciting Hill Climb Held and Big Parade to Come.

Indianapolis's seventeen agencies and nine manufacturers are this week holding an open house show or "spring opening," as they term it. The carnival week should have opened on Monday, 23d inst., with a decorated parade, but because the weather forecaster prophesied rain it was postponed until Wednesday, though not until 50,000 persons had congregated in the downtown district to witness the spectacle. The services of the weather forecaster will be dispensed with in the future because it did not rain. All the agencies along Indianapolis's "row" are tastefully decorated.

The feature on Tuesday was a big hill climb held up the sharp incline known as Michigan hill, northwest of the city. Thousands of spectators lined the course, which is exactly four-tenths of a mile long, and some exciting sport was their reward. Howard Hodson, driving a Stoddard-Dayton car won three of the five events, and in the class for cars listing between \$2,750 and \$3.500, made the fastest time of the day, 372/5 seconds. C. P. Brockaway, driving an Overland, a locally-made car, was the victor in the class between \$1,000 and \$1,800, and W. B. Peterson, Buick, made the fastest time in the event for cars listing under \$1,000. The feature was the small difference in times made by all the competing cars in each event, as shown in the following summaries:

Cars listing at \$1,000 and under—Won by W. B. Peterson, Buick, 0:483/5; second, Frank Menthorn, Ford, 0:56; third, O. G. Mayers, Reo, 1:033/5; fourth, Bert Corbet, Maxwell, 1:033/5; fifth, D. B. Sullivan, Lambert, 1:241/5.

Cars listing from \$1,000 to \$1,800—Won by C. P. Brockaway, Overland, 0:503/5; second, Guy Simonds, Stoddard-Dayton, 0:513/5; third. Harry Knight, Buick, 0:55; fourth, C. E. Gibson, Ford, 0:56; fifth, W. W. Beeson, Auburn, and O. G. Mayers, Reo, tied in 0:571/5; sixth Adams, Great Western, 0:58; seventh, Ferguson, Buick, 0:581/5; eighth, P. L. Crighton, Great Western, 1:013/5; ninth, F. M. Martindale, Leader, 1:061/5; tenth, J. W. Lambert, Lambert, 1:101/5.

Cars listing from \$1,000 to \$2,750—Won by H. Hodson, Stoddard-Dayton. 0:38\\frac{1}{2}; second, L. E. Finch, Thomas, 0:40\\frac{1}{2}; third, L. Markle, Oldsmobile, 0:44\\frac{1}{2}; fourth, Frank Nutt, Haynes, 0:45\\frac{1}{2}; fifth, Harry Knight, Buick, 0:46\\frac{1}{2}; sixth, Frank Nutt, Haynes, 0:47\\frac{1}{2}; seventh, A. W. Moore, Premier, 0:48\\frac{1}{2}; eighth, F. Eisle, Oldsmobile, 0:51\\frac{1}{2}; ninth, Miloch, Cadillac, 0:54\\frac{1}{2}; tenth, H. S. Wilcox, Autocar, 0:55; eleventh, R. L. Sutherland, Cylde, 0:58\\\frac{1}{2}.

Cars listing from \$2.750 to \$3,500—Won by Howard Hodson, Stoddard-Dayton, 0:37%; second, L. E. Finch, Thomas, 0:40%; and Harry Hammond, Premier, tied; third, L. Markle, Oldsmobile, 0:40; fourth, Ray Tinkle, Marmon, 0:47; fifth, C. W. Enzland, Marmon, 0:48%; sixth, H. S. Wilcox, Autocar, 0:52%.

Cars listing at \$3,500 and over—Won by H. Hodson, Stoddard-Dayton, 0:39; second, Thomas Kincaid, National, 0:3936; third, L. E. Finch, Thomas, 0:4136; fourth, J. Aitken; National, 0:42; fifth, Frank Clements, National, 0:44; sixth, G. W. Enzland, Marmon, 0:4736.

Motoring Sensations in Fiction.

There is a vast difference in point of view, both optical and mental, between the corner seat in the tonneau and the post of honor and responsibility behind the steering column. That is why the motorist is so frequently separated from his guest by a great wall of fear, which, in a measure, is only a barrier of experience. Difficult as it may be for the passenger to realize that his dread of some dire calamity is but a condition of mind, however, it is even more difficult for the driver to appreciate the attitude which induces this condition in one who is not accustomed to the sensations of motoring at high speed.

In "My Enemy the Motor," published by John Lane Co., New York, Julian Street presents the sensations of a direct drive initiation into an automobile existance That the picture is most vividly. humorous as well, is to be expected in the nature of things. It is a tale of a proposed tour in southern Europe, which Fate intervened to prevent. Not much as a tale, perhaps, but more as a picture, and very good as a study in mental attitude. The characterizations are terse and pointed; the descriptions take a firm hold on the nervous system of even the hardened driver; and the narrative moves as rapidly to its climax as does the exploit which it relates. The fact that it once appeared in magazine form does not detract from its amusing and entertaining quality, which makes up in tone for what the book lacks in number of words.

Milwaukee Referee Upholds a Protest.

The protest of the Cleveland Motor Car Co. against the penalization of 2680 points charged against the Continental-tired Cleveland in the Milwaukee three days reliability contest has been allowed by the referee. This decision reduces the penalty to 1430 points, and gives the car first place in Class A, for cars selling for \$3,000 and over. The protest arose over a difference in the time consumed in replacing a broken front spring.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

OLD BUCKMOBILE CASE REVIVED

Seaton Secures Affirmation of His Judgment Against the Late Dr. Brower— Echo of a Memorable Run.

Like an echo out of a long forgotten past was the decision handed down by the Appellate Division of the Supreme Court in Rochester, N. Y., in the case of Albert J. Seaton, respondent, versus Abram G. Brower, appellant. The decision was an order denying the motion to strike out interest reversed without costs. The judgment was modified by striking therefrom the amount of interest allowed, and as so modified affirmed, together with the new order denying motion for new trial, without costs of the appeal to either party.

The case was one which aroused considerable interest at the time of trial, as it had some bearing on the workings of the old Buckmobile Co. The first trial was held before County Judge Pritchard and a jury and was opened April 22d, 1907. Two days were consumed in the trial. The case was given to the jury, which returned a sealed verdict, awarding the plaintiff \$1,000.

In opening the case it was shown that Brower was president of the Buckmobile Co., and afterwards, in April, 1904, when it was taken over by the now defunct Black Diamond Automobile company, a larger corporation, he also became president of that company. The case hinged on the memorable run from New York to St. Louis.

Seaton, then in the employ of the automobile company, was chosen to pilot a car in the run, but he at first refused to go as the Black Diamond company owed him a considerable sum of money. The evidence showed that Brower prevailed upon Seaton to make the run, pointing out that a successful journey would mean much to the company, as it would enable it to sell its stock more readily. Seaton claimed he was promised \$1,000 to make the trip.

When the plaintiff rested, the lawyer for the defense said that Seaton had invented the buckmobile, "an outlandish looking machine on a buckboard," organized a company and got Brower and another into it. After speaking of the merger with the Black Diamond company the lawyer for the defense characterized Seaton as an "auto crank who would not have missed the St. Louis run for all the stock in both companies."

The evidence was very contradictory. Judge Pritchard, in charging the jury said the only thing for them to determine was whether Dr. Brower agreed to pay Seaton \$1,000 for making the trip. There was no question as to the amount and the verdict should be either no cause for action or \$1,000 for the plaintiff, and the latter alternative was taken by the jury.

Since the trial Dr. Brower died, and the claim is now against the estate.

BESNARD SYSTEM IN SOLAR LAMPS

Details of the Method for Eclipsing Headlight Glare—Division of the Rays into Two Groups.

Of the several ways by which it is possible to check the illumination of the acetylene headlight in order to prevent the unpleasant and even dangerous effects of its blinding glare upon opposing traffic, the most simple and obvious possess the disadvantage of temporarily impairing the usefulness of the lamp. In the Besnard system, the American rights to which recently

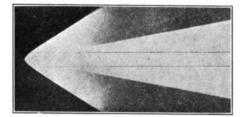

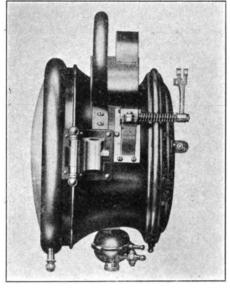

Fig. 1

were secured by the Badger Brass Mfg. Co., Kenosha, Wis., and applied in somewhat modified form to the Autoclipse and Solar-clipse lamps, this advantage is developed, that the throttling of the penetrating and dazzling beam of light which is reckoned the undesirable feature of all lamps of the plain searchlight type, does not in the least affect the illuminating power of the lamp within the restricted field immediately in front of the car. The very evident advantage is that the driver of the car, while enabled to protect other users of the road from the confusing effects of the long dis-

beam, focused for either very long or very short projection, is divided into two independent beams. The first is intended solely for illuminating the immediate foreground, and is a wide-angle distribution of a portion of the light emanating from the flame. The second comprises a highly concentrated beam, thrown directly through the other and projected to a great distance for

THE SOLARCLIPSE LAMP

the purpose of illuminating the road at a considerable distance from the car. The effect is thus practically that of two lamps, one for long distance and the other for short distance illumination. The way in which the light is distributed is made clear by the Solar people in their catalog just issued, which renders possible a better understanding of the Besnard system.

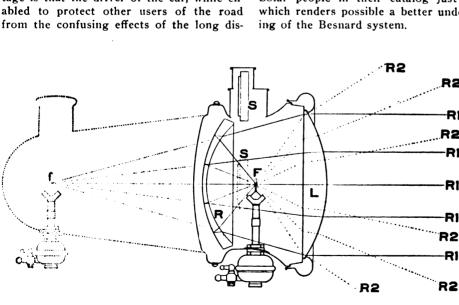

Fig. 2

tance rays of light, is still enabled to guide his car intelligently, since the road immediately before him is brilliantly illuminated.

In order to accomplish this very desirable effect, the light thrown from the lamp, instead of being concentrated in a single

The manner in which the light is distributed is shown by Fig. 1. In Fig. 2 the principle of the system is illustrated. The rays emanating from the front of the flame, F. are caught by the plano-convex lens, L, and distributed over the wide field directly

before the car, as shown by the rays, R2, but without developing any of the blinding effect which is the unpleasant feature of the average searchlight. These rays are permanent, and constitute the broad and mild beam shown in Fig. 1. The rays from the back side of the flame, F, are reflected from the hyperbolic mirror, R, back to the lens to form the concentrated long-distance beam of light, R1, shown in the center of Fig. 1, as covering the wheel tracks indicated by the two parallel lines in the center of the picture.

Without the special combination of hyperbolic reflector and lens which is known technically as a "hyperlenticular" combina-

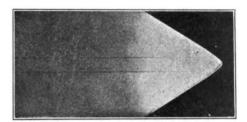

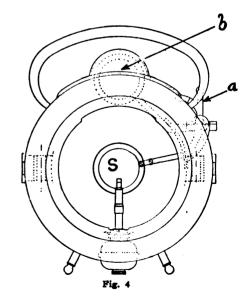

Fig. 3

tion, a much greater depth of lamp would be required in order to secure an adequate focal distance between flame and lens. How long a lamp would otherwise be required to secure the same projection of the long distance beam, is shown in Fig. 2, by the dotted lines and the indicated position of the equivalent flame at f.

The difference between the Autoclipse and Solarclipse lamps develops in connection with the reflection and refraction of the long distance beam, as it has been called. In the Autoclipse lamps, the French method of construction is employed, the reflector,

R, comprising merely a shallow metalic mirror, which is purely a reflector. In the Solarclipse lamps, on the other hand, a special form of lens mirror reflector is employed which performs the double function of reflection and refraction, thereby devel-

oping a higher degree of efficiency in handling the light, and also possessing certain mechanical advantages not to be found in the plain reflector, such as the very important non-corrosive property of the lens mirror.

Once the method of distributing the light is understood, the way in which the eclipsing of the long distance rays is brought about is easy to comprehend. All that is required is to interpose an opaque shutter between the back side of the flame and the mirror in order to eliminate the rays which are, for the moment, undesirable. To this end, the small shutter, S, Fig. 2, is brought down from its normal position in the heat hood to the position shown by the dotted lines. The resulting effect is shown in Fig. 3, where the light from the front of the flame only, is seen to be distributed through a very wide range, but with sufficient diffusion to dispel any blinding glare. The power of the flame, so employed, is sufficient to illuminate the road distinctly to a distance of 35 yards from the lamp, giving a clear view of the road, sufficient for running at low and moderate speeds with perfect safety. With the shutter raised to its normal position, on the other hand, the central beam is carried to a distance of 320 yards, developing the bright, white spot in the road, which is essential for ordinary running at night.

The mechinical construction of the lamp is further brought out by the front view shown in Fig. 4, in which the eclipsing effect is shown where the shutter is dropped into the position shown at S. Ordinarily. a spring suffices to hold it in the position, b, in the heat hood, from which it is displaced when desired, by means of the small lever, a, which is worked by a Bowden wire from the driver's seat. By a special method of connection, both headlights are manipulated by a single control wire, and in unison. The arrangement of the external lever and spring are shown in the side view of the complete lamp, which also emphasizes the compact construction which is brought about through the use of the hyperbolic mirror.

Little Clips that Require Care.

It is essential that the little clips which are so frequently employed to bind together the outer leaves of the ordinary elliptical springs, be held firmly in position, and that in the event of their being broken or lost, they be replaced immediately. If this is not done, the stress, when the spring is subjected to a heavy rebounding action, is brought almost wholly on the inside leaf, and unless more than strong enough for its ordinary work, there is great danger of its being broken.

THE MOTOR WORLD

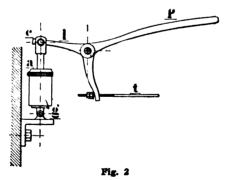

EASING THE CLUTCH ENGAGEMENT

Application of Suction Dashpot for Checking Motion—Progressive Action in Picking up the Load.

While there are certain drawbacks to every form of friction clutch which has yet been put upon the market, or used in connection with the motor car transmission, it is undoubtedly the case that the moving cause in nearly all improvements which

have been made, as well as in the development of the newer types which have in some measure replaced the old leather-faced cone type, has been the difficulty of obtaining a smooth engagement when picking up the load from rest. Skilful drivers never have

been wont to complain of the performance of the cone clutch in this respect, nor have they habitually failed to obtain good running results with it. Hence it would appear that in many respects, some device calculated to ensure the same method of engagement as is used by the skilled driver as a result of this training, would go a long way toward solving the problem of successful clutching of the load, regardless of the type of clutch employed.

One of the most obvious expedients which could possibly be employed in this connection is the use of the plain suction dashpot for checking the motion of engagement, and ensuring its progression at a stated rate. Such a system has been developed recently by the firm of Outhenin Chalandre, Neuilly-sur-Seine, France. It comprises nothing more nor less than a small attachment which may be connected to almost any form of clutch, and which serves merely to check the rate of engagement according to the adjustment of the escape valve upon which its action depends.

As shown sectionally in the accompanying Fig. 1, it will be seen that the device consists principally of a small cup or shell. fitted with a screw top and containing a small cylinder mounted centrally within it in such a way as to leave an annular space within the outer shell. The plunger, a, is connected by means of the clevis on its stem with some movable portion of the clutch actuating mechanism, while the shell is attached permanently to the frame of the car. A small orifice part way up in the side of the inner cylinder, shown at d, permits a certain amount of the fluid contained in the device to circulate as the plunger moves up and down, until the latter closes the opening. Thereafter the flow between the cylinder and the outer space, c, must take place through the small hole, e, which is regulated in area by means of the screw, f, and its lock nut.

Attached to a clutch of the familiar Panhard type, the arrangement is as shown in Fig. 2, P, being the piano-type of pedal, t, the actuating arm connected to the drag rod which disengages the clutch, and l, the braking arm, to which the shock absorber, or clutch regulator. a, is attached by means of its plunger, at e. The shell of the device, g, is mounted on the dashboard of the car, as shown, and is articulated to provide for a certain amount of radial movement.

When the clutch is to be engaged, instead of releasing the pedal gradually, as must be done ordinarily, the operator merely lifts his toe entirely clear of the pedal. when the spring is permitted to draw in the clutch until the small orifice in the cylinder of the device has been passed by the plunger, when the resistance to its motion becomes sufficiently great to slow it down to the desired rate. Thereafter, the engagement proceeds at a controlled speed and is rapid or slow, according to the adjustment of the regulating screw. The action is precisely the same as is employed in the ordinary form of hydraulic door check. The acceleration of the car is thus regulated to a uniform degree, and all starting jolts and shocks eliminated.

To Guard Against Short Circuits.

The length of a battery's life depends on how much current is taken from it. A short-circuit will quickly kill even a new cell. It is important, therefore, that in connecting up batteries or in putting them on a machine, care be taken not to let any metal parts touch the binding posts of the cells.

COMMERCIAL VEHICLE PROBLEMS

Limitation of Permissible Axle Load—How Met in Four Wheel Drive and Multiple Unit Trains.

What is admittedly the principal limitation of the commercial motor vehicle results from the double consideration of the unsatisfactory state of the tire problem, and the inability of the average highway to withstand the concentrated pressure of very heavy loads. Thoroughly successful commercial vehicle design, therefore, must be carried out with definite regard to a certain limiting permissible axle load. How this factor affects the transportation of very heavy loads, and how it is likely to work out in the development of motor haulage on a large scale, is considered by Joseph A. Anglada in a paper read before the Society of Automobile Engineers.

"Within the past few years it has been proven by users in general that, aside from the advertising value of commercial automobiles, which exists in few cases at present, the employment of auto-trucks of over 6,000 pounds load capacity is not as profitable as the employment of smaller vehicles," remarks the authority in question. "The rapid depreciation of the rubber tires in general use, and of the power generating apparatus, necessitating frequent repairs and replacements, are the chief reasons for the above state of affairs.

"A few vehicle manufacturers and users have attempted to solve the problem of expensive tire renewals by the use of various types of wooden and combination tires, and the use of resilient wheels. However, considering that by far the greater number of commercial automobiles of all types are still using and being equipped with rubber tires of the same general type used for the past eight or ten years, it seems that solid rubber tires, expensive as they are in all respects when used on large vehicles, are at present the most satisfactory solution of the problem.

"Another objection to the use of large trucks is their inability to exert sufficient tractive effort under all conditions of loading and road surface. As a remedy, some manufacturers furnish sand boxes for delivering sand under the driving wheels, as in railroad practice, while others endeavor to overcome this difficulty by driving all four wheels. The first method is an unsatisfactory makeshift, while the latter necessitates expensive complication of the propelling and steering mechanisms, with the extra weight of these parts assisting depreciation.

"The six-wheel vehicle is a step in the right direction, but the complication inseparable from this arrangement and the expense of building and maintaining this complicated construction detracts seriously from the attractiveness of the six-wheel proposition.

Unless at least four wheels are driven, the traction disadvantages of the two-wheel drive are always present. When four or six wheels are driven the objections stated above also count against this system.

"The system employing a tractor and trailers is used abroad to some extent, and has the advantage of distributing the load on a number of wheels. But the objectionable feature of having but one pair of driving wheels counts against the system; because, unless the driving wheels are provided with cleats to assist propulsion, it is impossible to haul a paying load at all times, and even with cleats the above is not possible if the road has deep sand or mud upon it. The use of cleats is objectionable because they cause the load on the driving wheels to be concentrated on comparatively small areas of the road surface, causing it to deteriorate rapidly.

"Col. Renard realized the shortcomings of the above system when he developed the road train system which bears his name. It consists of a train of vehicles, the leading vehicle having mounted upon it the powergenerating, speed-controlling and steering apparatus. A shaft arranged with the proper number of universal and slip joints extends throughout the length of the train and transmits the power of propulsion to the driving wheels of each vehicle. Thus it is possible to carry a large and therefore a well paying load without having excessively large individual vehicles, causing rapid depreciation of same due to the inability of providing resilient tires or wheels or springs for carrying heavy loads. The road surface is also protected, because the unit load on same is reduced, the weight being distributed on a greater number of wheels and therefore on a greater area of road surface. In addition, rubber tires are not necessary because sufficient tractive effort is obtained by the increased number of propelling members. Steel tires may be used on the trailing vehicles because there is no mechanism except the comparatively simple propelling and steering apparatus mounted on them, and on the leading or power-furnishing vehicle rubber tires are allowable."

It seems to the writer, after studying the Renard system, that its advantages may be retained and the complication of the power transmitting and controlling apparatus reduced and these parts made more efficient by the use of a modified system. This, he describes as follows:

"The leading vehicle has mounted upon it the steering and control apparatus, a source of motive power, storage battery, steam or internal combustion motor, but preferably the latter, on account of its simplicity and small weight per horsepower. The motor is coupled to an electric generator which furnishes current to a pair of electric motors on each vehicle. The vehicles are connected by means of a bar which transmits the steering effort from the drawhead at the rear of the leading vehicle to the front axle of each following vehicle. The length of this bar and the position of the front axle are so determined in reference to the rear axle of the leading vehicle, that the entire train follows the same course when turning. The vehicles are also connected by flexible electric conductors, arranged so as to be readily connected or disconnected when it is desired to place a vehicle in or out of the train.

"Three methods of control suggest themselves: First, the ordinary method of operating the internal combustion motor at a constant speed to obtain a constant voltage at the generator, and then, by means of a series paralleling controller, connecting the fields and armatures of the motors in various combinations, virtually as done in street car and electric train service. Second, a method in which by varying the speed of the generator its voltage is varied correspondingly, causing a proportional current to flow through the motors, making their speed and torque vary. Third, a method whereby varying the voltage of the generator, by changing its field excitation, its speed meanwhile remaining constant. causes an effect similar to that of the foregoing method. It would probably be found advisable to obtain the field current for the generator from an exciter mounted on the end of the main generator shaft, to save weight, and having its output controlled by the driver of the train.

"With the two latter methods, it would also be found advisable to provide a switch for connecting the two motors on each vehicle in series combination for climbing grades and for starting when the train was fully loaded. This switch could also be used for reversing the direction of rotation of the vehicle motors.

"The generator should be designed to furnish a direct current at 220 volts and the windings should be so arranged that when the output of the generator nearly equaled the output of the gas motor, the voltage of the generator would decrease and thus decrease the current flowing to the vehicle motors. This feature, while not absolutely necessary, is desirable because at no time is it possible to overload and stall the gas motor by careless operating. For instance, consider that the motors of the train, which are 220-volt direct current series motors, are operating in multiple combination, and that the train approaches a grade which requires more power than the gas motor can furnish to the motors in multiple combination. The generator voltage would decrease and thus prevent the vehicle motors and the gas motor from being overloaded, and if the driver should persist in not operating the switch to connect the vehicle motors in series combination, the train would come to a standstill if the power required was greatly in excess of what the gas motor can supply.

The chief source of difficulty with the average vehicle of current design, is the battery, as he further points out. The motor, and in the case of the gasolene-elec-

tric unit, the generator as well, are above suspicion, so that the only probable sources of trouble in a system of the sort in question, would be the controller and the conductors carrying the current to the various units. Such a train, in his opinion, would not weigh more than a train equipped with an entirely mechanical transmission, would not cost as much to build, and would operate more efficiently, and at a lower maintenance

"In this country multiple unit road trains have been constructed by the Gibbs Engineering and Manufacturing Co., and Alden Sampson," he continues. "The first Gibbs train consisted of a power wagon and two trail wagons. . . . The power wagon has mounted upon it a three-cylinder gasolene engine direct connected to a generator furnishing power to motors driving the rear wheels of all the vehicles. The leading vehicle is equipped with solid rubber tires and the trailers have iron tires. The speed of the train was regulated by a two-motor street car type controller so modified that by operating the drum intended for reversing the car motors, the vehicle motors, which were regular series wound electric vehicle motors, would be connected in series or multiple combination. . .

"The second Gibbs train consists of a power wagon and four trailers. The power wagon has mounted upon it two three-cylinder gasolene engines driving a double commutator generator through positive clutches on the engine shafts and Morse chains. The rear wheels of all of the vehicles are driven by series motors through gearing and roller chains."

The road wheels, in particular, he calls attention to, which, he says, "are steel discs flanged at the outer circumference. The discs are riveted to bronze bushed steel hubs and steel tires eight inches broad. Speed regulation is obtained by means of a controller similar to the one used on the first train, with the exception that the controller drum generally used for reversing the car motors is in this case used to connect the two windings on the armature of the generator in series or parallel. . . .

"This train was used to transport machinery and supplies from a railroad to a mine in Arizona. The route is 115 miles each way and leads through a desert and mountainous country.

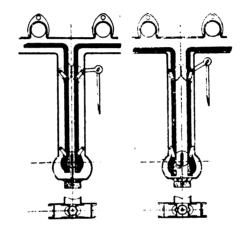

"The Alden Sampson train, which was exhibited at the last Madison Square Garden show, consists of a power wagon and two trailers, the former carrying a four-cylinder gasolene motor, driving a dynamo by a silent chain. The power plant, which occupies the forward part of the vehicle, is mounted on a separate spring suspended frame, while the rear part is arranged for carrying a load. All the vehicles are of the six-wheel type, the large center wheels being independently driven on all of the vehicles. . . . The trailers are double-ended, so that they may be operated in either direction."

THE MOTOR WORLD

ORIGINALITY IN INDUCTION PIPE

Its Modification of Throttling Action—
Features Reducing Sectional Area
Through Its Entire Length.

Among other confusing notions which a close study of the carburetter problem breeds, is the idea that the usual methods of throttling by restricting the area of the delivery pipe, cutting down the cross section of the gas flow at one point only, gives it opportunity to expand after passing the valve, thereby robbing it of some of its heat, and tending to cause condensation, with consequent upsetting of uniformity and general reduction in the value of the gas from the standpoint of its combustible quality. On this account, the poor running

of many motors when throttled is accounted for in a comparatively simple manner.

To overcome this difficulty, an English inventer, W. Gillett, whose Gillett-Lehman carburetter already has been described in these columns, has developed a new form of induction pipe in which the throttling action instead of being confined to the valve alone, as is ordinarily the case, has the effect of reducing the sectional area of the induction pipe throughout its whole length, thus ensuring uniform velocity in the gas for the entire distance it must travel after leaving the mixing chamber, preventing any tendency to pocketing, eliminating re-condensation, and securing permanence in the gas to a degree which is impossible of attainment with the ordinary arrangement.

As shown in the accompanying illustration, the induction pipe, at the base of which the fuel jet is located much in the ordinary way, instead of being the usual simple conduit, comprises an outer casing, within which are mounted a couple of moveable vanes running its whole length and coupled together by means of an external mechanism in such a way that the movement of a suitable lever causes them to move toward one another or apart, as the case may be, thus varying the area of the passage. Instead of being round or oval, the outer casing is rectangular in section, and the move-

able vanes fit its sides tightly, so that the space enclosed between them must at all times form the conductor for the gas. When open to their full capacity, the area is nearly the same as that of the outer casing itself, but when closed, as for running under throttle, the area is considerably reduced, the upper curved portions of the vanes also rising as well as approaching one another in such a way as to reduce the working area of the intake manifold as well as the induction pipe itself.

The idea is distinctly a novel one, and though introducing an amount of complication which a year or two ago would have been thought absolutely unjustifiable by the requirements of the case, is sufficiently in line with present theories to ensure careful consideration for it. There can be no doubt that re-condensation does occur in the average manifold and to an unpleasant degree at times. Whether it is only to be overcome by some mechanical means such as this, or whether it may be obviated by some more subtle method, remains to be seen.

One Rule Without an Exception.

A rule to which there should be no exception is: "Never start the engine when the car is standing over gasolene." Frequently when filling the gasolene tank some of the fuel finds its way to the ground, either from overfilling or because of carelessness in pouring into the filler hole or funnel. To start the engine over this overflow is to invite serious trouble for it is often that sparks are discharged from the muffler when the engine races and this is especially true if the muffler contains much soot. Occasionally a leak in the gasolene pipe or tank, or maybe a carburetter float chamber in which the seat of the needle valve needs grinding, will permit of the gasolene forming in a puddle when the car is standing on the street. It is important to stop such leaks and it is better to keep the car in motion than to stand over exposed gasolene, which a match, carelessly thrown in the street, may ignite.

Precautions in Removing the Magneto.

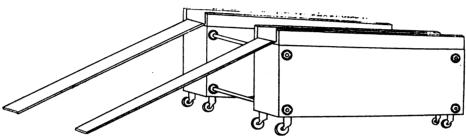

It is so easy to remove the average, modern, high tension magneto, and the temptation is so great to dismount it whenever the least excuse presents itself, that the usual caution as to observing its timing before doing so, cannot be repeated too often. All that is necessary is to see that the driving gears are properly "spotted," and that the marks are sufficiently intelligible so that on putting the device back into place it will be possible to mesh the gears exactly as they were in the first place. A very small slip in this respect may be sufficient to upset the running of the motor and necessitate the complete re-timing of its ignition system, especially when the operator is not sufficiently well acquainted with the properties of the magneto to be able to locate the trouble at once and remedy it correctly.

PORTABLE SUBSTITUTE FOR A PIT

Easy and Inexpensive to Construct—May also be so Made as to Serve as a Turn Table.

No matter how accessible the parts of an automobile may be, the necessity for getting under it arises sooner or later, than which nothing in connection with the repair of a car, is more disagreeable.

While a pit offers the simplest solution of the difficulty it is not always practical for the private garage; and the small repairman frequently has not the facilities for this adjunct to his repair plant. It is, howin the use of the brakes on steep descents. By setting the emergency in a position where it will permit of the car attaining only the desired momentum and releasing it after a short distance has been traveled, substituting for it the foot brake, and in turn releasing that before it becomes heated, both brakes are kept cool and the wear on each is reduced to the minimum, as the real destruction comes from heat rather than from service without heat. On hills that are long it is a good plan to cut off the spark and have the momentum of the car turn the engine over a few times in this way cleaning out the cylinders and cooling them. If this is done it is desirable to use caution in starting up the power, as a sudden jerk will occur unless the speed of the

SUBSTITUTE FOR PIT AND TURNTABLE

ever, a comparatively easy matter to construct a device that will give the opportunities for working beneath the car without entailing the expense incident to the construction of a pit. One of the sort is shown by the accompanying illustration.

First get two pieces of channel iron several inches wide, and of sufficient length to be two or three feet in excess of the wheel base of the car. Mount these on timbers or castings that are twelve or fourteen inches high and have an inclined approach to each channel. Place these two channels so that the distance between them is the same as the tread of the car, and then run the latter up either under its own power or by using jacks. The space that is thus gained beneath the car will be found to be sufficient to enable the repair man to work under it at great advantage. If the two structures are tied together in some manner and castors put under them, the whole will serve admirably as a turn-table or portable stand.

Uses of the Emergency Brake.

The emergency brake, as the name implies, is a brake for use in tight places where something more than the foot brake becomes necessary. But the emergency brake has other uses than that of the sudden stopping of the car.

When descending a long hill, especially if the grade is steep, the continued use of the foot brake causing an intense heating of it, and if the construction is such that a lining is employed in the brake shoe, it will be quickly destroyed by the continued friction. To prevent this destruction, which entails some expense and considerable labor in replacing the lining, it is well to alternate

car is in accord with the speed of the engine.

Warming a Car with Exhaust.

The use of hot air from the exhaust to heat a motor car for winter touring is the novel scheme of J. D. Turner, a Franklin owner of Grand Forks, N. D. Mr. Turner recently made a 700 mile trip in a Franklin runabout from Grand Forks to Quincy, Ill., in the midst of a real western blizzard, but with his new heating apparatus and a closed canvas top he and his companion went through the zero weather in comfort.

The method of heating consisted of placing on the floor of the car a coil of pipes connected directly with the "main exhaust." The "main exhaust" of the Franklin carries off only about 30 per cent. of the burnt gases, and its temperature was just about right to heat the ear comfortably. The remainder of the exploded gases in the Franklin passes out through the auxiliary exhaust, which opens at the lower end of the cylinder.

Causes and Effects of Overheating.

Running with too rich a mixture, too late a spark or too much throttle opening all tend to cause the same difficulty—overheating. The result in either case, must be a slow explosion, which results in a high cylinder temperature throughout the whole of the working stroke, instead of only during the first part of it, and a high exhaust temperature and pressure. The result is that the lubricant is burned from the cylinder walls before it has time to perform its proper function; that the surface of the exhaust valve becomes pitted; and that the engine tends to overheat.

DRESSING FOR LEATHER TOPS

Formulas for Preparations Adapted to Old or New Material—Improving Wear as Well as Appearance.

The competent chauffeur is one who in addition to his ability to drive the car, assumes a personal interest in its upkeep and appearance. The power plant, while it may be his chief concern, is not the only part that receives his attention, for the body and accessories require some care, and if a casual observer sees evidence of these minor parts having received it, it safely may be concluded that the entire equipment is receiving adequate care.

One of the problems that are presented to the man, whether chauffeur or owner, who desires to give proper care to every part of the car, is the method of preserving a leather top. As long exposure to the air will cause the leather to become dry, unless it receives a proper dressing, it naturally follows that in this condition cracks will occur when the top is folded—as it generally is—and when the cracks appear the surface is, of course, lost. For the treatment of leather which has begun to "go bad," a good mixture is the following:

To one pint of neatsfoot oil add a quarter of a pound of beef suet, completely melted so that no lumps remain; stir the mass thoroughly before adding a tablespoon full of melted beeswax; shake in a closed dish or can sufficiently to insure a perfect mixture, and then add one ounce of ivory black, and again shake thoroughly. Rub this on the top with soft cloths, taking care to rub the mixture well into the leather; the effect will be to cool the top and impart to it a redeeming elasticity.

In cases where the top has suffered greatly from wear or harsh treatment, it is well to obtain a first class top dressing which can be purchased ready for use or prepared in the following manner:

One pint of liquid asphaltum, one pint elastic finishing varnish, one pint of boiled linseed oil, one-half pint japan, a pint of turpentine; add to this one pound of ivory black and mix thoroughly. Use freely and rub in well.

To Start Magneto from the Seat.

Starting the motor from the seat when high tension magneto ignition is employed, has been considered, if not impossible, at least so difficult as to be hardly worth considering as a possibility. In a recent foreign invention in this line, however, just this feature is made possible by the adoption of a ratchet driving gear for the magneto armature, whereby it may be rotated by hand to obtain the first one or two "shots," the gear afterward picking up the shaft at the proper point in the cycle to insure correct firing sequence.

LAW TO PERMIT HILL CLIMBING

Massachusetts Senate Reports Favorably on Bill to Authorize the Closing of Roads for Contests.

There is now a probability that the Worcester Automobile Club will hold another climbing contest on Dead Horse Hill during next summer. The committee on roads and bridges, of the Massachusetts Senate has reported favorably on a bill providing that local authorities may grant permits to persons to drive automobiles and motorcycles in hill climbing contests during specified times on specified parts of the highway at any rate of speed. The bill is practically the same as section 9 of chapter 52 of the Revised Statutes, which authorizes the mayors of cities and selectmen of towns to close public roads temporarily for bicycle races.

The senate committee gave a hearing on this bill on Friday, 6th inst., when the Worcester Automobile Club, which had asked for such legislation, was represented by Daniel F. Gay and others. Mr. Gay told the committee that the road on Dead Horse Hill is an abandoned one on the Boston and Hartford turnpike which has been fixed up by the club at an expense of about \$1,500 for the purpose of automobile hill climbing. It is no longer a public thoroughfare between any particular towns, and was little used before the Worcester Automobile Club repaired it.

On two occasions the club arranged climbing contests, the last being two years ago, when approximately 10,000 people assembled. Sixty patrolmen were engaged to keep the street clear, but it was found that they had no authority. All they could do was to suggest to the spectators that they "kindly step back" to make room for the automobiles to come up. No body of men has the authority to close a highway for an automobile contest. Hence the club asks fhat the Legislature confer upon the mayor and board of aldermen of a city and the selectmen of a town authority to give special permits for special occasions to close the streets during a specified time, and upon a specified stretch of road. It was the purpose of the Worcester Automobile Club to make the law general so that any city or town might benefit from it, though the club has no other direct interest in it than to secure conditions of safety for its own contests on Dead Horse Hill. If the bill is rejected there will be no contest, otherwise the club may arrange one for this year.

Start of a Four Years' World Tour.

One of the most extensive automobile tours of the world was begun last week when Mr. and Mrs. H. A. Hover left Los Angeles in a Maxwell car for a four years'

THE MOTOR WORLD

tour of the world. Starting from Los Angeles they will go south across the line into Mexico, returning to Los Angeles by a different route. Going north, they will follow the coast road to San Francisco and from there will go on to Portland and Spokane, via Seattle. The next jaunt will be eastward, through Idaho, Montana and the Dakotas, turning north to Winnipeg into Canada. Hover says he will be the first to drive an automobile from Winnipeg to Toronto. From Toronto they will go to Chicago, by way of Buffalo, turning back to New York. From New York the car will be shipped to Naples. The first winter the Hovers expect to cover the Riviera thoroughly and will go into Algeria and the Nile region. The summer will be spent in Northern Europe, touring in England, Scotland, Ireland, and Sweden. By the winter of 1910 the Hovers expect to have seen most of Europe and will then go on to India, and from there to China, Japan and the Philippines. The trip is being made purely for pleasure and Hover states that he will travel five years if four is not enough to see all the places of interest in the world.

Minneapolis to Revise Ordinances.

All automobile ordinances now in force in Minneapolis are to be repealed and a new ordinance is to be adopted. This move results from representations made to the city council through Attorney Will, representing the Minneapolis Automobile Club, that a new ordinance recently adopted is not consistent with former ordinances passed. It has been decided to increase the price for tags from 50 cents to \$1, on the ground that a tag that would be acceptable to owners of fine cars cannot be furnished for less. The Minneapolis Automobile Club is to furnish a draft of the proposed new ordinance.

Cab Driver's Costly Carelessness.

Reckless taxicab drivers would do well to remember the fate of the Parisian driver who ran into and killed a professor. The chauffeur was not the worst sufferer for he was sentenced to only three months' imprisonment, but the company figuratively got the axe. It was made to pay damages of \$10,000 to the victim's widow, together with \$5,000 to an unmarried daughter and \$1,400 to each of four other children.

Bar Harbor Again Bars Automobiles.

Bar Harbor (Mount Desert Island, Maine) will remain closed to the automobile for another season. At the town meeting held last week in the town of Eden, of which Bar Harbor is a part, the citizens voted on the proposition to permit automobiles to be run on what is known as Bay View drive, which was defeated by a vote of 415 against 174.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

DIG REGISTRATION POLLOWS SHOW

Sudden Increase in Demand for Massachusetts Licenses—Statistics of the State's Income from Motorists.

There has been a notable increase in the number of automobiles registered in Massachusetts within the past three weeks, which by some people is attributed largely to the influence of the recent show in Boston. E. J. O'Hara, who has charge of the automobile department of the State highway commission, states that the week before the show 314 automobiles were registered; during show week the number went up to 438; and last week the figures climbed toward 600. Motorcycle registration also took a jump. Sixteen new dealers were registered while the show was in progress, and eight others have taken out certificates since its close.

Since the first of January, when the law required that all motor vehicles be re-registered, the highway commission has issued about 6,900 certificates for automobiles, 300 for motorcycles and 275 for dealers. The demand for private operators' licenses has hardly begun and only 346 new licenses of this sort have been issued. The number of professional chauffeurs, however, is growing rapidly and it begins to look as if the demand for operators for hire would be more than supplied. Since the beginning of the year 231 new chauffeurs' licenses have been issued and 460 have been renewed. Up to the middle of the month, when the figures from the automobile department were last tabulated, the commission had taken in more than \$40,000 from this department. Of this amount over \$38,000 was for registration of cars and under \$2,000 for licenses. The commission is preparing for a heavy rush during the next six weeks.

No Dinky Runabouts for Police Head.

When Superintendent of Police Regan, of Buffalo, heard that the Board of Aldermen is in favor of buying a \$900 car for him he laughed.

"Think of me riding in one of those dinky little runabouts," he is quoted as saying, as he threw out his chest and contemplated his stature. "Why, I would have to let my feet hang over the dashboard. Huh, \$900 wouldn't buy the wheel of the kind of an automobile that is needed for the police department. What we need is a big touring car that will carry a half dozen officers. No doll carriage for me! Reckon I'll stick to the old nag. He can't negotiate the New York to Paris race course, but he always gets round in time for oats. The police department needs a big car, which can carry enough detectives to handle a case in time of emergency. If the city's money is to be spent upon an automobile one should be provided that will prove serviceable."

The Week's Patents.

877,613. Driving Gear for Motor Road Vehicles. Percy G. Tacchi, Acton, London, England. Filed Nov. 18, 1905. Serial No. 287,956.

1. The combination with a casing, of an internally threaded sleeve carried by said casing, a driven shaft passing through said sleeve, an externally threaded sleeve mounted on said shaft with its threads in engagement with said internally threaded sleeve, a rack and pinion adapted to rotate said internally threaded sleeve on its shaft to move the same longitudinally, a clutch cone adapted to rotate the said internally threaded sleeve, means for preventing longitudinal movement of said clutch cone or said last mentioned sleeve and a driving shaft provided with a second clutch cone with which said first mentioned clutch cone may be engaged by the longitudinal movement of the sleeve.

877,709. Automobile Lift. Charles W. Gearing and William J. McGee, Franklin, Pa. Filed Aug. 29, 1907. Serial No. 390,595.

1. In an automobile lift, the combination with the floor of a garage, of channels let into said floor and adapted to receive the wheels of an automobile, and means for raising said channels.

877,711. Instrument for Indicating Speeds, Distances Covered, and the Like. Eugene V. Gratze, Leytonstone, England. Filed Oct. 16, 1906. Serial No. 339,221.

1. In combination, a substantially annular stationary magnet, a revolving core positioned between the poles of the magnet, a metallic casing adapted to embrace the core and extending beyond both sides thereof, spring means for controlling the rotation of the casing, indicating means operated by the casing, and means for rotating the core.

877,714. Combined Power Transmission and Automatic Mechanism for Motor Driven Vehicles. Thaddeus W. Heermans, Evanston, Ill. Filed Jan. 22, 1907. Serial No. 353,519.

1. In a motor driven vehicle, the combination with the motor driven shaft, the driven axle and power transmission connections between said motor shaft and driven axle, of an automatic brake mechanism cooperating with said power transmission connections, means whereby the brake mechanism is automatically operated to arrest the vehicle upon tendency of the load to drive the vehicle, and means for disconnecting the driven axle from said brake mechanism at a point between the axle and brake mechanism.

877,726. Vehicle Rim. Walter J. Nordlund, Oakland, Cal. Filed March 4, 1907. Serial No. 360,440.

1. A wheel rim comprising a fixed section and a movable section, said section having opposed interlocking cam surfaces, and a rotatable member operable between the fixed and movable sections and engaging both sections whereby one section may be moved axially relative to the other section.

877,730. Explosive Engine. Herbert R. Palmer, Cleveland. Ohio, assignor to The Palmer Oil Engine Company. East Cleveland, Ohio, a Corporation of Michigan. Filed Aug. 28, 1903. Serial No. 171,041.

1. In an explosion engine, in combination, a cylinder and piston, on explosion chamber upon said cylinder, a valve in said explosion chamber, means for conveying motor fluid adjacent to said valve, an injector plunger adapted to cross and thereby block the outlet for said motor fluid and at the same time inject an explosive charge of such fluid into said explosion chamber through said valve, and a variable cam for controlling said injector.

877,750. Motor Vehicle. Walter G. Windham, London, England. Filed Jan. 23, 1906. Serial No. 297,427.

1. In a motor vehicle the combination of a chassis, a front seat secured thereto and suitably disposed for the driver, longitudinal runners on the chassis, and a rear half-body detachable from the chassis by sliding rearwardly upon the runners, substantially as set forth.

877,762. Operating Device for Motor Vehicles. Pierre A. Darracq, Suresnes, France, assignor to Societe A. Darracq & Cie. (1905) Ltd., Suresnes, France. Filed March 29, 1907. Serial No. 365,323.

1. In a device for controlling change speed, reversing and brake parts for motor vehicles the combination of a frame, springs on said frame, a driving axle secured to said springs, a change speed a reversing and a braking device upon said axle, a pivoted balance beam on said frame, a fork connecting said balance beam and said axle, means upon said beam for pivotally supporting a plurality of levers, means connecting said levers to the devices upon said axle and means to enable the driver to operate said levers.

877,835. Combined Steering and Driving Axle. Paul Daniel, New York, N. Y. Filed March 12, 1907. Serial No. 361,930.

1. A motor vehicle, comprising a cross member adapted to support the vehicle body, a steering knuckle pivotally connected to each end thereof, wheels rotatably mounted upon said steering knuckles, a driving axle comprising a plurality of sections, one of said sections extending through one of the steering knuckles and having an enlarged end, and the other of said sections being connected thereto by a universal joint within said expanded end and anti-friction bearings intermediate said expanded end and said steering knuckle.

877,856. Spring Tire. Thomas J. Mc-Carthy, Los Angeles, Cal. Filed March 27, 1906. Serial No. 308,197.

1. A wheel tire comprising concentric bands, one embracing and radially movable over the other and one of said bands fixed to the wheel, circumferentially arranged springs radially seated within and between said bands, fittings secured between said springs and said bands and provided with lugs at each corner, and two sets of diagonally disposed springs arranged side by side between each two of said radial springs and connected at their opposite ends with said lugs from the upper corner of one fitting to the lower corner of the other fitting.

877,924. Air Compressor Mechanism for Self-Propelled Vehicles. Ernest E. Hampton and Cicero G. Smith. Palisade, Colo. Filed Oct. 1, 1906. Seriel No. 336,965.

1. In air compressor mechanism for vehicles, the combination with a moving part of the vehicle, of an air receiver mounted on the vehicle, and means actuated by the air in the receiver for automatically rendering the compressor mechanism inoperative when the air has reached a predetermined limit of compression within the receiver, said means comprising a cylinder, a piston

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07. Uso Columbia Lock Nuts

REO

Big return on small investment

EARNS MONEY

I purchased my folding-seat REO for my own family but it has earned \$300 for me after hours, at livery work. It makes about 23 miles on a gallon of gasoline, with four passengers. It is as good as new. I have yet to find a hill too steep for it to climb.—D. F. Hyman, Shelton, Neb.

HELPS BUSINESS

Since 1905 I have run my REO Touring-car 20,000 miles. It is most economical in tire-wear. Oftentimes six months have elapsed without its being in the shop. It is continuously out of doors from 8.30 A. M. to 7 P. M. in summer's heat and winter's cold.—Charles Aldrich, M.D., Cleveland, Ohio.

Can you afford to overlook it?

One Price for Warner Auto-Meters

EVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being ob-That was ourselves. But, unfortunately, we sold to the jobber also - and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out - that hurt the consumer, the dealer and ourselves. For the jobber knows

no law. So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact

figure the dealer pays. If he cuts,

he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

MITCHELL MOTOR CAR CO.

INCOMPARABLE THE

FOR SERVICE CAR THE

CLEAN SWEEP FOR THE WHITE IN CALIFORNIA HILL CLIMB

The White Steamer won all three events in which it was entered in the hill-climbing carnival held at San Francisco in connection with the recent automobile show. A 30 H.P. White touring car won the class for cars costing up to \$3500, and a 20 H. P. White touring car won in the \$2500 class. In the free-for-all, the same 30 H. P. car. with body removed, again triumphed. It made the climb in 1:38; which is to seconds faster than that made by its nearest competitor.

The superiority of the White in hill-climbing has been demonstrated in every public contest in which it has competed or, more properly speaking, been allowed to compete. climbing ability is the true test of real power, of available power, of power at the rear wheels, and it is evident that hill-climbing contests furnish the real demonstration of what the various systems of motive power can do, and that the tables of "rated horse-power" are of purely theoretical interest.

Write for Literature

New York City, Broadway at 62d St. San Francisco, 1460 Market St. Chicago, 240 Michigan Ave. Philadelphia, 629-33 N. Broad St. Cleveland, 407 Rockwell Ave. Pittsburg, 138-148 Beatty Street.

The Matter of Safety

is often overlooked by automobile designers and results are often serious, sometimes disastrous. In the

this is considered an important detail and safety

of operator and car is given equal consideration.

A leading feature is the automatic spark retarder, by means of which engaging the starting crank positively retards the spark, thus removing all danger from premature ignition.

As to safety of the car, there is no greater source of trouble than loosened bolts or nuts.

In the Rambler this is prevented by the use of Rambler lock nuts that positively cannot come loose, or by castellated nuts locked in place by cotter pins.

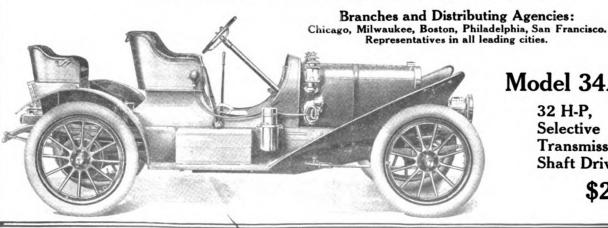

These are in themselves but small things, but it is such attention to little things that makes the Rambler

No. 1

CHALFANT TO SUCCEED BUDLONG

Appointed Assistant General Manager of A. L. A. M., with Full Control— His Career in the Trade.

E. P. Chalfant has been appointed assistant general manager of the Association of Licensed Automobile Manufacturers and will assume the duties of the office on April 15th

Chalfant's appointment was announced immediately after a meeting of the executive committee of the association on Tuesday last and caused considerable surprise as his name was not among the many which had been mentioned in connection with the vacancy caused by the resignation of General Manager Budlong. In fact, owing to Chalfant's designation as assistant general manager, some doubt existed as to whether he was fully succeeding to Budlong's office. When a question to this effect was put to those in authority it brought this reply:

"Mr. Chalfant will have full control."

Like so many of those identified with the automobile industry, Chalfant graduated from the bicycle business. During later years he was head of the International Tire Co.'s sales department and for several years past and at the present time, he is sales manager of the Waltham Mfg. Co., whom he represented on the A. L. A. M. board. He is a large, serious man and has the reputation of being an earnest, painstaking worker.

Waterloo Cars Cooled on New Plan.

The Waterloo Car and Engine Co. has been formed in the Iowa city of that name with these officers: W. M. Law, president; E. P. Caldwell, secretary; H. B. White, treasurer. The company purposes building both automobiles and street cars which will be driven by gasolene engines the feature of which is "a new and improved means for cooling the cylinders." It is ex-

plained that the new method is "simply a combination of air and water"—very much less of water than now is usually used.

John Kane Mills Admits Bankruptcy.

John Kane Mills, president of the Dragon Motor Car Co., which recently went into the hands of receivers, last week filed a voluntary petition in bankruptcy in New Jersey, Mills being a resident of Morristown in that State. The difficulties of the company are said to be partly responsible for his failure. His liabilities are placed at \$292,851.08 and the assets at \$121,576. Of the liabilities \$141,701.35 are in secured claims and \$49,399.73 unsecured.

Three Companies Increase Their Capital.

Three concerns identified with the automobile industry have certified to increases of capital stock, as follows: Corbin Motor Vehicle Corporation, New Britain. Conn., from \$200,000 to \$500,000; Mason Motor Car Co., Des Moines, Iowa, from \$50,000 to \$100,000 and the Pennsylvania Rubber Co., Jeanette, Pa., from \$750,000 to \$1,500,000.

Trustee Sells Kansas City Plant.

The trustee in bankruptcy of the Kansas City (Mo.) Motor Car Co. last week sold the plant to F. E. Wear, who originally had sold to the company the twenty-seven-acre site on which the the plant stands. The price paid was \$47,000, enough to pay about 15 cents on the dollar to the creditors. A lot of machinery in the plant went for \$4,200.

Lightning Fires an Automobile Factory.

Lightning which struck the Port Huron (Mich.) plant of the Northern Motor Car Co. on Friday evening last, 27th inst., caused a fire which entailed damage to the extent of about \$10,000. The loss is fully covered by insurance.

Shoemaker Assets to be Sold.

The court has authorized the receiver of the Shoemaker Automobile Co., Elkhart, Ind., to sell the property at its assessed value, \$17.965.57.

MAY ORGANIZE TRAVELING SHOW

"Independents" Appoint Committee to Consider Gigantic Scheme—Outline Plan of a Three Months Tour.

Although it is stated that it does not necessarily imply that the association will not again join with the Automobile Club of America in promoting a show in New York City, "independent" show affairs took a rather unexpected and sensational turn at a meeting of the Committee of Management of the American Motor Car Manufacturers' Association, held in New York on Monday last, and while not officially adopted, a special committee was appointed to make a report at the next meeting. Briefly, the idea is that of a gigantic traveling show which will be carried half-way across the continent. Instead of asking people to visit other cities to see an automobile show, it is planned to carry the show to their towns during the selling season when people are ready to buy cars. Something of the same sort was undertaken a few years ago by an individual manufacturer, but the present plans call for participation by all the 52 members of the A. M. C. M. A.

The idea as outlined at yesterday's meeting, and which originated with Charles E. Lewis, of the Jackson Automobile Co., calls for a special train of thirty freight cars to carry the machines, and a train of Pullmans for the salesmen and demonstrators. The trip would last at least three months, a day or two being spent in each city having a population of more than 100,000.

If the plan is adopted, the start will be made from Detroit, thence going to Cleveland. Rochester, Syracuse. Utica and Albany. Following this route, the cities visited will include Springfield, Worcester, Boston, Providence, Hartford, New Haven, Bridgeport, New York, Newark, N. J., Atlantic City, Trenton, Philadelphia, Baltimore, Washington, Richmond, Charleston, W. Va., Pittsburg, Columbus, Cincinnati,

Indianapolis, St. Louis, Kansas City, Omaha, Des Moines, Minneapolis, St. Paul, Milwaukee, Chicago and Detroit.

With the participation of say fifty automobile manufacturers, with cars listing from \$500 to \$9,000, the pro rata cost would be very materially reduced, although the estimates furnished by the contracting agents of the railroads, indicate a total expenditure of about \$100,000.

Besides showing the cars, the scheme includes hill climbing and other contests to indicate the worth of the various cars.

At Monday's meeting of the Committee of Management there was a general discussion regarding trade conditions, while reports of a routine nature were heard. The proposed carnival in New York City was heartily endorsed. Those present at the meeting were: H. O. Smith, Premier Motor Mfg. Co.; G. V. Rogers, Mitchell Motor Car Co.; R. M. Owen, Reo Motor Car Co; C. C. Hance, Nordyke & Marmon Co.; W. H. VanDervoort, Moline Automobile Co.; S. H. Mora, Mora Motor Car Co., and Alfred Reeves, General Manager. In the absence of Benjamin Briscoe, chairman of the committee, H. O. Smith occupied the chair.

Jury Gives Dickinson \$19,000 Verdict.

After a trial lasting ten days, a jury in the United States court at Scranton, Pa., awarded Fred S. Dickinson a verdict of \$19,000 against the Matheson Motor Car Co. of Wilkes Barre. Dickinson claimed that he acted as agent for Charles R. Greuter in the sale of certain patents to the defendants, and that he was promised 40 per cent. of any sum that the sale realized. The defendants claimed that while Dickinson acted as agent for Greuter, in purchasing the patents, they eliminated the plaintiff in their calculations altogether.

Three Dixons Form Two Companies.

H. S., W. F. and E. M. Dixon, who have incorporated two separate International Motor Car Companies, one in Illinois, the other in New York, each capitalized at \$250,000, are said to be merely acting for other men. It is understood that the companies were formed to take over and operate the W. O. Worth patents which have been bobbing up periodically for several years and under which a number of friction driven trucks and busses have been built at Evansville, Ind., by the Worth Motor Car Mfg. Co.

Lausier Joins the Timken Staff.

Edwin B. Lausier has resigned as sales manager of the motor department. American and British Mfg. Co., of Bridgeport. Conn. He has accepted an important position with the Timken Roller Bearing Axle Co., Canton, Ohio.

Moon May Shine in New Place.

The Moon Motor Car Co. may remove from St. Louis to Detroit. Officers of the company say that they are considering a "flattering offer" but have not reached a decision.

In the Retail World.

The Hygrade Motor Car Co., Newark, N. J., has given up its garage at 11 and 13 Hill street.

C. A. Dundas has opened a new garage at 757 West Seventh street, Riverside, Cal. He will handle a California made car.

The garage of the Canada Cycle and Motor Co., 20-22 West Adelaide street, Toronto, suffered a fire on March 21st. The loss is placed at \$1,000.

D. M. Jackson is now the sole owner of the Warren Automobile Garage, Warren, Pa. Previously that garage was conducted by the firm of Jackson & Cross, but Cross has withdrawn.

Paul Melchart, of Pittsburg, has been in Wheeling, W. Va., for several days demonstrating the White car. The reason: The White Company will shortly open a branch there and Melchart will be in charge.

The Corn Belt Auto Co., of Waterloo, Ia., is expanding. A branch house will be opened at 324 South Main street, Mason City, under the name Mason City Auto and Supply Co. Frank W. Bryant will be in charge.

The Fred A. Mabbett Co., Rochester, N. Y., has consolidated with the United States Automobile Co., which latter title will be continued. The concern will handle the Pierce, Locomobile, Franklin, Selden, Stevens-Duryea, Cadillac and Oldsmobile.

F. J. Jastrin's automobile shop, on Exchange street, Freeport, Ill., is to be enlarged. The addition will be a two-story, 40 by 60, structure of brick, with concrete floor and unobstructed by posts or partition walls. It will be used as a garage. The contract price is \$3,000.

Webb Jay, the former well known race driver of the White, now in business in Chicago for himself, has added another car to his list. He will be agent for the Acme, in addition to the Kisselkar, and the Webb Jay steamer. It is stated that his company has been reorganized and capitalized at \$500,000.

The Hayes Rubber Co., which recently set up a tire and supply store on Warren street, New York, has for its treasurer and backer none other than David Grinberg, who is one-half of that peculiarly interesting firm, Grinberg & Morris, who prefer to trade under the title Manhattan Storage Co. and other names. Many things in the Warren street establishment indicate that Grinberg influence is both active and strong.

The Week's Incorporations.

Milwaukee, Wis.—Haines Motor Co., The, under Wisconsin laws, with \$10,000 capital. Corporators—Samuel J. Haines, William E. Brown.

Kankakee, Ill.—International Motor Car Mfg. Co., under Illinois laws, with \$250,000 capital. Corporators—W. F. Dixo., H. S. Dixon, E. M. Dixon.

Robinson, Ill.—Bessemer Gas Engine Co., under Illinois laws, with \$200,000 capital; to deal in engines and machinery. Corporator—H. B. Willower, Robinson, Ill.

Tenafly, N. J.—Tenafly Auto and Supply Co., The, under New Jersey laws, with \$3,000 capital. Corporators—H. LeRoy Demarest, Clifford Demarest, J. E. Tuttle.

St. Louis, Mo.—Gardner Motor Vehicle Co., under Missouri laws, with \$75,000 capital; to manufacture and deal in automobiles and supplies. Corporators—John W. Gardner, E. T. Jones.

Brooklyn, N. Y.—Modern Automobile Co., under New York laws, with \$3,000 capital. Corporators—Leonard Vielbig, 238 Grove street; Charles C. Limbarth, 529 Monroe street; Henry Delle, 84 Bleecker street, Brooklyn, N. Y.

New York City, N. Y.—Securo Mfg. Co., under New York laws, with \$25,000 capital, to manufacture automobile parts. Corporators—Raymond Magee, Charles B. Young, and Henry S. Reynolds, 111 Broadway, New York City, N. Y.

Somerville, N. J.—E. W. Stevens Co., The, under New Jersey laws, with \$200,000 capital; to manufacture vehicles, engines, etc. Corporators—E. D. Cronin, Brooklyn, N. Y.; F. Knowlton, New York City, N. Y.; R. H. Osgoodby, Somerville, N. J.

·Wilmington, Del.—Auburn Motor Car Co., under Delaware laws, with \$10,000 capital. Corporators—Frederick Liebfried, Jr., 503 Chestnut street, Philadelphia, Pa., Howard W. Trump, Jenkintown, Pa.; M. G. Ryan, 910 Spruce street, Philadelphia, Pa.

New York City, N. Y.—Senate Motor Car Co., under New York laws, with \$100,000 capital. Corporators—Albert W. Meisel, 5 Beekman street; Frank O. Fuller, 522 West 147th street; Christopher B. Craske, 106 West 78th street, New York City, N. Y.

Motor Buggy Makers Go Under.

On the application of the F. A. Austin Pattern Co., whose claim for drawings and patterns amounts to \$550, W. R. Craven has been appointed receiver for the Hatfield Motor Vehicle Co., Miamisburg, Ohio. The concern undertook to manufacture motor buggies but did not make any considerable progress.

Spier Quits Cars for Bearings.

John C. Spiers, manager of the Autocar factory, has resigned that position to become factory manager of the Standard Roller Bearing Co., Philadelphia. Spiers has full charge of the manufacturing department of the latter concern.

SHRINKAGE IN FEBRUARY EXPORTS

Lessened by Notable Gains in Six Geographical Divisions — Mexico Makes Biggest Cut in Figures.

During the month of February 151 complete automobiles, worth \$301,240, and parts to the valuation of \$47,124 were exported from the United States, the total representing a depreciation of \$95,340, in round numbers, over the corresponding total of 1907. The loss is mainly in the value of complete cars, of which 213 were exported in February, 1907, the decrease in valuation of parts exported amounting to less than a third of the total depreciation.

The loss was made in the face of notable gains in the case of 6 of the territorial divisions of the export field, however. Italy, the United Kingdom and the group classed as Other Countries led in this counter movement with gains of \$33,500, \$27,300, and \$11,900 approximately, in the order named. Of the countries displaying less interest than heretofore in the American product, Mexico took the lead with a falling off of no less than \$82,507, West Indies and Bermuda, British North America and British Australia following with \$44,200. \$31,100, and \$11,300 roughly speaking.

For the eight months ending February 29th, a gain of \$188,577 over the corresponding returns for last year was developed. Only 1,518 cars were exported, as against 1,582 last year, their combined value, however, showing an increase of \$220,841. The valuation of parts, however, revealed a decline amounting to \$32,264. Of the eight countries showing improved markets for this period, the United Kingdom, with \$363,-582, France, with \$100,990, and West Indies and Bermuda and South America, with \$38,000 and \$36,000 nearly, following. Losses were evidenced in the case of Mexico, which fell away to the extent of \$273,-674, British North America, and British Australasia, with losses in the two latter instances of \$57,667 and \$43,886, respectively. The report in detail follows:

Where Prosperity is at High Tide.

With orders on their books sufficient to keep their plant running for the next 18 months, the Continental Motor Mfg. Co., Muskegon, Mich., have let contracts for the crection of a new machine shop, 110 by 175 feet, which will be ready June 1st. building will be of one story, absolutely fire proof and saw tooth roof construction. The Continental people intend to place their present machine shop equipment in the new building and are also making extensive additions and increases to their machine tool equipment comprising the latest and most modern machinery for accurate and precise work; most of these machines are automatic and are built specially for their use.

The Continental company have just completed a large motor testing house which is also fire proof and which they claim to be the largest and best equipped in the country for that purpose, there being capacity for testing 50 finished motors at one time. The proposed addition is the fourth enlargement of their plant, which has been made since they located in Muskegon less that two years ago, since which time the company had added motors for taxicabs and commercial vehicles and for a variety of uses foreign to automobiles.

Drops the Count and Takes up Plows.

Count Manuel de Caserta, who was seeking a site for a De Dion-Bouton factory in this country, and about whom some unpleasant stories cropped out, has dropped out of the enterprise, which it seems has not been abandoned. The count has been succeeded by W. J. Plows, Jr., of New York, and the industrial department of the Delaware & Hudson Railway still is making efforts to have the projected factory located on its route in New York State.

Big Business in Bosch Magnetos.

There is nothing the matter with the demand for Bosch magnetos. During the week ending March 14th, the Bosch Magneto Co. report the sale of exactly 4,970 of their instruments, and add that they are now over 1,000 behind orders.

RECEIVERS ARE NOT REMOVED

Toledo Effort to Oust Pope and Yule Fail of Their Purpose—But Third Receiver is Named.

As a result of the hearing on the two motions filed by Toledo interests which had for their object the removal of Albert L. Pope and George W. Yule as receivers of the Pope Motor Car Co., neither of them were removed. Instead, a third receiver, F. A. Scott, secretary of the Superior Trust Co., of Cleveland, was appointed, with special reference to the guarding of the Pope-Toledo interests.

The case was heard on Friday last, 27th ult., by Judge R. W. Taylor, sitting in the United States court at Toledo. It was notable for the great array of legal talent that was brought to bear, the petitioning creditors being represented by three attorneys and Receivers Pope and Yule by four.

The declaration was made by one of plaintiff's lawyers that at the time a receiver was asked for the Pope Mfg. Co. and the Pope Motor Car Co., the claims against the latter company did not aggregate more than \$800, while the claims against the Pope Mfg. Co. amounted to more than one million dollars.

Other attorneys representing the creditors declared that the interests of Receivers Yule and Pope centered so strongly in the Pope Mfg. Co. that they would not be likely to give the creditors of the Motor Car Co. an impartial deal. It was also claimed that the parent corporation had drained the resources of the local plant without right.

After hearing the arguments, Judge Taylor said that while Receivers Yule and Pope might be valuable, it was plain they could not represent both sides and that he would appoint a third receiver.

The selection of Mr. Scott was announced later, and is said not to have been wholly agreeable to the Toledo people who had hoped for the appointment of a local man. It was indicated by the court that the duty of the third receiver would be to guard the interests of the creditors in the local plant and especially the claim of \$800,000 which Albert L. Pope has against the Pope Motor Car Co.

Detroit Dealers Re-elect Old Officers.

At its annual meeting attended by every member, the Detroit Automobile Dealers' Association re-elected all the old officers, as follows: President, A. I. McLeod; vice-president, J. P. Schneider; treasurer, J. H. Brady; secretary, George E. Lane.

Hardy Locates on Forty-second Street.

The R. E. Hardy Co., the spark plug manufacturers, have removed from 86 Watts street to 25 West Forty-second street, New York.

THERE'S A REASON

The public, which in the past, has experienced difficulty in obtaining automobile supplies should give us a trial, by mail, or a personal visit.

We Carry in Stock the Largest Assortment of PARTS, FITTINGS AND SUNDRIES
To be Found in this Country

Our Catalog, the most complete one of its kind, is an encyclopedia of motor car supplies; it is used daily by other supply houses and they could not get along without it. A copy mailed to any one on request.

Order from nearest Branch and save time and express charges.

About Fictitious List Prices.

It is becoming quite apparent that in the readjustment that is taking place in the automobile industry, there is crying need for readjustment of the prevailing prices of accessories. Those in position to know are well aware that in certain parts of the country conditions have arisen which have led to cut-throat competition on the part of the retail trade, while in many more places dealers simply cannot be induced to "stock up." They are "standing pat" or purchasing only to meet immediate requirements. As a result few of those who have to do with accessories are wholly happy.

It is a situation due largely to adherence to what may be termed "prosperity prices," which is but another term for "fancy figures" and fictitious lists. The time when possession of a motor car places a man in ures" and fictitious lists. The time when with the small car is cutting an increasingly larger figure in the industry and as small cars are not usually noted for a wealth of equipment, the size of his purse must be reckoned with for he is in many respects the most likely buyer of accessories, that is, when they are placed within his means.

The fictitious price never can endure and the manufacturer who forces himself to believe to the contrary rarely fails to encounter a day of reckoning which brings with it a rude awakening. Generally speaking, fictitious list prices prevail throughout the accessory trade. They were made to assure handsome profits to every person engaged in their sale. They were made to be handed down through a long line of middlemen. One of the purposes they have served has been to attract and enrich a not small number of nimble-witted merchants who consider that prices are made only to be cut, and so great is the tendency toward inflation that even these merchants do not scruple to add a dollar or two to prices in order to make their "discounts" appear the larger. The merchant whom we style legitimate has been the chief sufferer. Patronage simply has flown past his door. Such inflated prices have served their purpose and it were well that the fact be recognized before it is too late.

It requires no great perspicacity to discern that an article listed at say, \$62, which is sold to an automobile manufacturer for say \$22, and at the latter price nets a profit to the producer, is a "fancy price." The same is as true of the article which is catalogued at \$1.50, and which can be sold by the jobber at a good profit for 60 cents. Inconsistencies of the sort are the rule rather than the exception and the time has come when they no longer promote sales, but retard them. The fact that even the Automobile Club of America has instituted a cut-price store is a straw which shows which way the wind is blowing. It indicates that even the men of means are rebelling against the enforcement of "pros-There are jobbers who perity prices." freely admit that profits are mischievously disproportionate. There are dealers who not only admit it, but who have taken the bull by the horns and are measuring for themselves the size of the profit they consider fair. They are sharing with their customers when they are not refusing to "stock up."

Early in the season, one of the astutest men in the whole industry sized up the future as being one of unusual promise for the accessory people. He said in substance that however the year might pan out for the automobile manufacturer, the signs pointed to a volume of replacements which assured prosperity for the producers of accessor-It was the soundest of many forecasts that were presented. going awry not because of faulty sifting of evidence, but because the inevitable effect of the fictitious price is making itself felt. There are some things which automobilists must have, and must pay for; there are other things which they would have but can do without, and they are doing without them solely because the wisdom which comes with age and experience has taught them that there is "something wrong with the price." The indications that exist are plain even to those who are most affected and to close their eyes to the truth simply is inviting stagnation or commercial suicide.

The Motor World is well aware that prices and profits constitute a tender subject for discussion, but it is not its policy to blow colored bubbles that the trade shall be assisted in deceiving itself. The situation in the accessory market is one that calls for plain speech, openly expressed, before the mischief, already started, shall get beyond control. A readjustment of prices is necessary and without undue delay.

The Perfection of the Whole.

As a result of the intimate relationship between all the parts of the motor car, it happens that no effect can be produced except at the expense of all or nearly all of them, even though many of organs seem not to be in the least involved. Thus the very act of propulsion, though apparently confined solely to the power plant, is made possible only by the resistance of such other parts as frame, springs, axles, steering gear and even of the body as well. Nor are the resistances in question those to which the parts are nominally subjected in bearing the dead weight of the vehicle, but additional stresses due solely to the driving power of the motor. The average motorist, and, it is to be feared, the average designer also, has been slow in getting away from the idea that the only strains to which the machine is subjected are those due to the apparent purpose of every part, plus a substantial addition in the case of points supposed to be vulnerable to road shocks.

Before the bicycle could reach its present state of mechanical perfection, it was necessary to learn that no part was indis-

pensable, that none could be superfluous, and that none could be skimped or slighted in the making, if a successful and substantial product was expected to result. Ultimately the motor car will have to be considered on this exacting basis and no part neglected in a close scrutiny the object of which shall be to determine the absolute suitability of every part for its place. A readjustment of values must take place before the entire vehicle may be expected to evidence a uniform degree of endurance in all its parts. It is not simply neglect that causes cars to fail in one particular respect during any given season, or for several seasons in succession. Rather it is apt to be ignorance on the part of the designer of the real causes of the difficulty.

Radius rod design and spring motion have not been commonly considered as factors in any way governing tire wear. Yet that such must be the case in certain instances, at least, has been demonstrated. The effect of spring motion on the steering gear, to take another example of apparent irrelevancy, or the effect of engine torque on spring wear, for still another, or again, the effect of spring motion in the wear of gear teeth in the transmission—these and a dozen other instances which readily come to mind are cases of direct relationship which, because of differences in nominal purpose, are lost to view in many cases, or guarded against almost blindly, with a convenient factor of safety.

Motor car design, in its best and most useful stage, must come to be admitted as one of the most successful exploits of engineering skill ever undertaken. It is not so recognized at present, nor will it be wholly successful until such recognition is afforded it. The man who has attempted to design a car comes to have a profound respect for it—not as the work of his hands, but as a problem. At present he is practically alone in holding that opinion. Later, the enormity of his task may be better and more generally understood.

Where Light is Wanted.

Unless he is more circumspect in his picturesque straddle of the issue, Prof. Schwarzkopf may not only sell Poobah Shattuck one of his ten dollar books but the poobah is as likely to propose him for membership in the Automobile Club of America as he unproposed him several sad years ago.

Despite the fact that the professor's foreign blood is the genuine article and the poobah's red circulating medium is merely imported and was injected by inspiration, it is not strange that their hearts occasionally should beat almost as one; for truly blood is thicker than gasolene.

But for the benefit of obtuse Americans, the professor should submit diagrams showing wherein a house divided against itself is stronger than the undivided house, and wherein an organization working for itself or for one community and which in doing so is pulling against all other organizations and all other communities, is serving the best interests of the cause for which it stands. Diagrams of the sort would quicken the sale of any book.

Prof. Schwarzkopf, whose say-so always is perfectly lovely, would further add to the blithesomeness of Spring, by pointing out not the unsnakeishness but the graciousness and other beauties of "good wishes" in which is artfully concealed a dose of poison bearing the plain but unwritten label, "We hope you choke."

In fact, nothing would serve so very many peculiar purposes as an essay from a Schwarzkopfian pen discussing thoroughly the advantages of co-operation which does not co-operate and of the admirable qualities of a large, domineering gentleman with a gorgeous beard that would make even Van Dyke envious, who, when he discovered several other large gentlemen, unhappily devoid of beards, who refused to be domineered, decided to shoot marbles all by himself in his own back yard. Who better could write such an essay than a professor of biography?

According to his press bureau, Chairman Hower of the A. A. A. Touring Board is little short of a god on pneumatic tired wheels. Although this opinion does not wholly agree with the sentiments of all who participated in the last Glidden touring contest, it may be true for all of that. Among other things, it is stated that in formulating the new rules, the doughty chairman has answered every criticism and corrected every fault, which is in the nature of cheering news. It will cause the rules to be awaited with keen interest. It will be interesting, for instance, to observe whether, with a fat surplus on hand, Mr. Tower and his committee still will require an entry fee of former proportions and whether there is to be repeated that silly procedure of permitting contestants to come within a few yards of controls and remain, watches in hand.

COMING EVENTS

March 31-April 4, Salt Lake City, Utah—Automobile show in Auditorium skating rink.

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 6, 7 and 8, Denver, Col.—Annual show in Mammoth skating rink.

April 6-11. New York City—New York Automobile Trade Association's carnival week.

April 11, San Francisco—California Automobile Dealers' Association's hill climb.

April 16-18, Memphis, Tenn.—Automobile show promoted by the Automobile Dealers' Association of Memphis, in the Auditorium.

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

May 5-6, Harrisburg, Pa.—Motor Club of Harrisburg's second annual endurance run.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

until the proper moment for crossing the line arrives; also whether Mr. Tower will be again privileged to change a route if he sees fit and whether a schedule arranged for fair weather will be made to serve as well for foul.

It may be unconstitutional for Congress to pass the bill designed to provide a Federal license, but for the first time the fact will occur to many men that a constitution is sadly in need of tinkering which permits 46 different parts of the same country to exact passports and admission fees from certain citizens of each other part who are supposed to be citizens of the whole country. The average American has been disposed to fancy that that sort of thing could exist only in Russia.

Senator Frelinghuysen, of New Jersey, whose home is in New York, has introduced a bill into the legislature of the State in which he does not reside, designed to permit insurance companies to insure automobiles. Mr. Frelinghuysen's office—in New York, of course—is part of an insurance company's establishment!

INDIANAPOLIS CARNIVAL A SUCCESS

Postponed Parade a Monster Demonstration of Progress—Thousands Amused by the Obstacle Races.

Although the hill climb on Tuesday last was a big success, the postponed parade on Wednesday afternoon, 25th ult., was the star feature of the spring opening week arranged by the automobile tradesmen of Indianapolis. It was the greatest automobile parade ever held in the city. From two until three o'clock almost the entire city stopped work to witness the procession of cars that strung out for six blocks. The parade was designed to evidence the continued growth of the trade and it served its purpose well. The parade should have opened the spring carnival on Monday, but on account of expected rain, which did not fall, it was postponed until Wednesday.

The parade was the biggest demonstration witnessed in Indianapolis in some time. It absorbed the attention of the whole downtown district and was watched by from 50,000 to 100,000 people. By actual count 225 cars were in line, separated into three divisions. The first was composed of cars of the city, led by city officials and dignitaries. The middle division was made up of commercial vehicles, while out-of-town cars brought up the rear.

One of the odd features of the parade. and one that had historical interest because it reflected back on the days when the lumbering ox team dodged stumps in the National road, was the ox team outfit representing the National Furniture Co. The firm called it the "special horseless delivery." The interesting exhibit proved in the nature of an object lesson to the thousands of school children who witnessed the parade, for they see thousands of automobiles at the present time while few of them have seen an ox team actually in commission. The oxen and automobiles told a story of American progress in transportation.

The obstacle races on Thursday afternoon furnished considerable amusement to the 3,000 or more spectators that lined both sides of Capitol avenue. Both obstacle races-for touring cars and runaboutswere designed to test the skill of drivers in "ticklish" places. About 200 barrels were set in every conceivable position along the avenue and the competitors had to drive one block, turn around and go back to the starting point. Each barrel hit counted 20 points off a 500 per cent. score, and each second over 100 seconds counted one point against the contestants, as well as one point for every second less than 100 seconds, so that the events proved speed judging contests as well as obstacle races.

There were only two runabouts that did not touch a barrel, those being Bixby's

Pope-Waverly and Chilson's Autocar. Bixby was awarded the event as he made the better score on time. Of the touring cars, Hicks, Cartercar, made the best score.

Cecil Gibson, Ford, won the egg cracking contest, although it was a close break between him and Adolph Staub in an Oldsmobile. The driver had to send his car over a two by four scantling, crack an egg and return without crushing the egg. Gibson showed that he had the best control and backed off the egg just before the chicken squawked.

The low speed on high gear contest was won in slower than a walk by Frank Staley, White, who took 2 minutes 56½ seconds to cover one block. Harry Hammond, Premier, was second in 1:47½. This event was a revelation to the Indianapolis police officials who had no idea that an automobile could go so slowly and still keep moving.

The "open house week" closed on Saturday night with a big smoker at the Grand and although no figures are forthcoming it is said that the carnival proved very profitable to the tradesmen, to such an extent, in fact, that they are talking of holding a big indoor show next year.

The Center of Attraction at Toledo Show.

Toledo dealers held their second annual show in the Coliseum in that city last week, opening on Monday night, 23d inst. For several days the exhibit that drew the largest crowds was that of the Central Carriage and Automobile Co., not that the cars shown by that concern were any better than some others, but because the Toledo papers had advertised a popular car for sale at \$8.25. This unheard of price nearly caused the manager nervous prostration until he discovered the typographical error in his advertisement was the cause of such unlooked for interest in his exhibit. The cars shown at the show were: White, Mitchell, Maxwell, Cadillac, Franklin, Pope-Waverly, Stoddard-Dayton, Jackson, Ford, Reo, Pope-Toledo, Peerless, Winton, Oldsmobile, Rauch and Lang and Baker.

Dayton Dealers Have the Show Fever.

Dayton, Ohio, will have an automobile show in the Armory during the week of April 20 to 26, to promote which the Dayton Automobile Dealers' Association has been formed. The following officers were elected: President, G. G. G. Peckham; secretary-treasurer, A. M. Dodds. The firms comprising the association are the Dayton Automobile Co., Peckham Carriage Co., Borderwisch Auto Co., Smith-Clemens & Hopping, and the Speedwell Motor Cor Co

First Show Held at South Bend.

South Bend's (Ind.) first automobile show was held in the garage of the Twentieth Century Motor Car Co. on Thursday, Friday and Saturday of last week, March 26th to 28th. The cars shown were the Studebaker. Buick, Tincher, Perfection, Simplex, Oldsmobile, Rapid, Woods and Apperson.

CARNIVAL SPIRIT IN NEW YORK

Interest in the Coming Joy Week on the Increase—Program of Features in the Celebration.

There is every prospect that when on Monday next, 6th inst., New York City will begin its celebration of the tenth anniversary of the introduction of automobiles into the metropolis that the "carnival week," arranged by the New York Automobile Trade Association, will prove a more momentous occasion than originally appeared probable. The program arranged, which will include a night parade, a hill climbing contest, a run to Bronxville, and a smoker for members and the trade participating in the carnival, holds much of general and spectacular interest and as the major events constitute a "free show," the public scarcely will fail to do its part in great numbers.

It is expected that the city's "automobile row," as a considerable length of Broadway is designated, will present a carnival aspect. Several of the sales rooms are preparing to spread themselves in the way of decorations, while "open house" will be observed in all the sales rooms and garages during the week.

The illuminated parade on Tuesday night should prove a pretentious affair with its five divisons, composed of Vanderblt cup cars and historic section of old cars; dealers' 1908 models, decorated cars, commercial vehicles, and lastly, the division composed of advertising features, which division is likely to provide a number of eyepleasing surprises.

The parade will assemble at Broadway and Fifty-seventh street, at 7.30 p. m., proceeding south to Twenty-sixth street, thence into Fifth avenue and north to Fifty-seventh street, going west up Broadway to 110th street, passing in review before the judges' stand at Eighty-seventh street. The procession will turn at 110th street, and proceed south to Columbus circle, where it will disband.

The hill climb is made up of eleven events and will be held on the short 10 per cent. Fort George hill at Dyckman street, and the Speedway on Thursday afternoon, permission having been granted by the city officials for the use of this course. This will be the second time the course has been used for a hill climb.

On Friday the Trade Association will hold a run to the Gramatin Inn at Bronsville, where a dinner will be held in the evening, while the entertainment of the Automobile Club of America has arranged for a "carnival" to be held at its club-house Saturday night. In addition to an attractive vaudeville program some numbers will be contributed to the program by members of the trade, who have been invited to participate.

FRELINGHUYSEN BILL ON ITS WAY

Jersey Senate Passes It with Proposed Taxation Reduced—Bill in Assembly Extends the Speed Limit.

Senator Joseph S. Frelinghuysen, of New York City, by choice, but of New Jersey by political preference, is as happy as possible under the circumstances. His revised automobile bill passed the New Jersey Senate on Monday night of this week, 30th ult., which by a peculiar coincidence, was the day previous to the meeting of the Associated Automobile Clubs of New Jersey.

If the Assembly concurs, the registration fees will be raised from the present rate of \$3 for vehicles below 30 horsepower and \$5 for those above 30 horsepower, to \$3 for cars below 10 horsepower, \$5 for those between 10 and 30 horsepower, and \$10 for those of 30 horsepower or over. It increases the drivers' licenses from \$1 and \$2 to \$2 and \$4. In the original draft, introduced as an amendment to the present law, Frelinghuysen sought to raise the registration fees on a sliding scale-\$3 for cars of 10 horsepower or less, \$5 for cars of 20 horsepower or less, and upjumps of \$5 for each additional horsepower. Likewise were the drivers' license fees increased proportionately from \$1 and \$2 to \$25. As the Motor World stated last week the "come down" is of considerable magnitude.

Provision is made for licensing by blanket license cab companies operating adjacent to ferries, provision being made that they shall operate only within fifteen miles within the borders of the State.

Manufacturers' licenses are to be issued annually at a cost of \$25 for five cars, according to the provisions of the new bill, but not more than five cars can be operated under one license. If it is desired to register more than five cars the fee will be \$5 tor each car so registered. The original new bill did away with manufacturers' blanket licenses. Motorcycles are to be taxed \$2 per year and carry such identification marks as may be prescribed by the Commissioner of Motor Vehicles.

It is provided that all identification marks shall be provided by the State, and be changed annually; also, that the receipts from all sources shall be so distributed by the Commissioner of Public Roads that those counties that have improved their roads by the county act shall receive their pro rata share with those that have been improved by the State roads act. Nothing is in the new measure to prevent the charging of visiting motorists an admission for to use the public highways of New Jersey, which however, Senator Frelinghuysen does not have to pay, as he issues his correspondence on a letter head bearing a New Jersey date line, although he purchases his stamps in New York City, where he resides.

THE MOTOR WORLD

Senator Frelinghuysen also introduced a bill on Monday, amending the insurance act permitting the organization of companies to insure against loss by automobile accidents.

Despite the passage of Frelinghuysen's revised bill by the Senate, the situation has become even more complex by the introduction of another automobile bill in the Assembly, one which increases the present maximum speed limit of twenty miles an hour to thirty miles and hour. Its sponsor is Representative Austen Colgate, and as he has been made a colonel and personal aide on the staff of Governor Fort, it would seem that the bill designed to permit a higher rate of speed has the endorsement of the governor.

Monday was an unusually busy day at the New Jersey capital. In addition to the passage of one Frelinghuysen bill and the introduction of another, J. B. R. Smith, Commissioner of Motor Vehicles, submitted his annual report to the governor for transmission to the legislature. That Commissioner Smith is not in favor of experimenting with present automobile laws was made plain. He believes that until some substantial agreement between the persons interested can be reached, it would not be sound policy to experiment further.

The report of the commissioner is interesting. It shows that during the past year there were issued 17,619 registration certificates and 18,085 drivers' licenses. The total income from these sources amounted to \$80,054.87. The fines remitted to the State during the year aggregated \$5,640. The total amount paid to the State treasurer was \$85,694.87. The entire expenses of the department, exclusive of agents' fees, were \$13,372.60. Under the law the gross receipts from all sources are turned into the State treasury, to be paid out upon the designation of the commissioner of public roads for the repair of the improved roads of the State, and the entire expenses of maintaining the department are borne by the Department of State.

The commissioner predicts that time and experience will result in concrete, practical suggestions for solving automobile problems, and goes on to say:

"The few points upon which substantial agreement has been reached are well understood. The question of fees paid for licenses and registration appears to be nearing solution, and there seems to be a general agreement that larger fees should be paid. The amount of the increase, however, is still a matter of serious consideration.

"Proper identification is the keynote to all efficient regulation, yet such identification should not be made unduly burdensome. The real value of the law must, in the end, depend upon the efficiency of those whose duty it is to enforce it. The final solution of both the identification and the inspector questions will doubtless be reached by easy stages."

COEY OUITS CHICAGO MOTOR CLUB

Not Big Enough to Hold Both Him and Picard, He Says—Cause of the Latest Quarrel.

C. A. Coey and Paul Picard have been fighting again. After being whitewashed of charges preferred by Picard, Coey has tendered his resignation as a member of the Chicago Motor Club, explaining that no club is large enough to hold Picard and him as members. This is not the first "fight" that Picard and Coey have indulged in to the amusement of Chicago's motor tradesmen, but without resulting in such hostility as preceded this action on Coey's part.

The charges and resignation are the outgrowth of the New York-Paris "race" and the reception of the competing cars in Chicago. Coey, as a member of the Thomas crew, according to the charges of Picard, declared that the Thomas had been sent over the wrong road from Michigan City to Chesterton, Ind., by Picard, representing the Motor Club, who had gone as far as Michigan City in his efforts to meet the racers and to pilot them into Chicago.

The Thomas car was stalled in the drifts between Michigan City and Chesterton two days and attributed their trials and tribulations to the failure of Paul Picard to transmit information about the condition of the roads, holding that they should have been sent via Furnaceville. Coey aired his grievances against Picard as a member of the Motor Club in advertisements, and the charges before the board of directors of the club resulted.

David Beecroft presided at the special meeting called to hear the charges and with him were George Greenburg, Harry Branstetter and Joseph V. Lawrence. President Donald was present by proxy. Coey was attended by Attorney Benjamin Levering and Charles E. Gregory. Paul Picard was unattended, claiming that he was uninformed of the trial and therefore unprepared.

Picard was the only witness called, and his explanation that he had not been informed of the trial resulted in considerable feeling being displayed by members of the directorate, sitting as judges. Branstetter brought matters to a climax by withdrawing from the meeting and the others voted to dismiss the charges "because of failure on the part of the prosecution to present sufficient evidence, but with the privilege of reinstatement."

The failure of Paul Picard to produce the advertisement upon which the charges were based was really responsible for the indecisive ending of the hearing. Immediately upon the decision, acting through Attorney Levering. Coey presented his resignation, explaining that no club was large enough to hold him and Picard as members.

BRISCOE SAYS BUSINESS BOOMING

Actual Deliveries 50 per cent. in Excess of Last Year—His Views of Past and Future.

"We are reaping the reward of faith," said Benjamin Briscoe, president of the Maxwell-Briscoe Motor Co., in discussing the present situation. "The Maxwell factory has not laid off a man all season, but on the contrary has been working to capacity during the past few months of business depression, while other factories either

for delivery early—a most important advantage to be gained over those of our competitors who were standing idle or undecided as to what to do. Then I figured that, as almost all other factories had cancelled orders for material—indicating that they would turn out only about half as many cars as we had previously estimated they would—there would be still more room—and more demand—for Maxwells. So we increased our output 25 per cent.

"Our faith is being rewarded in a way that surpasses our fondest hopes. Our sales since August 1st show an increase of 42 per cent. over those of the same period last year and those of January, February,

SCUDEBAKER ELECTRIC AMBULANCE SUPPLIED TO FEDERAL GOVERNMENT

closed down entirely or worked a short force.

"That we not only did not curtail our output but actually increased it over our original schedule was due to our unbounded faith in the stability of the country and of the automobile industry—at least that part of it engaged in the production of moderate priced cars—and that we have been unable to accumulate a single car against the heavy Spring demand is proof that our optimism was justified. Ordinarily, we plan to produce several hundred cars over the delivery demands in the months from November to March, but this season we have been hard pressed to keep up with current orders.

"At the time when the breaking of a few banks threw some of our competitors into a fit, and pessimism was rife, I looked the situation over and came to the conclusion that that was our time to make a ten-strike. I was certain of the ultimate recovery of trade and I believed the period of depression would be short-lived. On those grounds we determined to push work in all four plants so as to have Maxwell cars ready

and March surpasses last year by 50 per cent. When I say sales, I mean deliveries—not merely orders. Seems as if this showing gives the lie to the too general supposition that the automobile industry is to suffer more than other branches of commerce from the temporary depression. For my part I predict that the total business of 1908 will exceed that of 1907 by greater or as great a margin as that of 1907 was in excess of the year before. In other words, I believe the automobile has become a necessity in the every day life of practically every successful business and professional man."

Uncle Sam Buys Another Ambulance.

The Studebaker Automobile Co. recently delivered to the Medical Department of the United States Navy at Washington, D. C., a handsome electric ambulance. The body, which is of the special design shown by the accompanying illustration, is fitted upon a regular Studebaker 1500 pound capacity chassis. The ambulance has a speed of twelve miles per hour and a radius of forty miles on one charge of the battery.

OLDS REPORTS RUSH OF ORDERS

Business Away Ahead of Last Season and No Let-up in Sight—His Opinion of Situation.

"We already have received orders for five hundred more cars than the 1908 contracts made with our agents called for, many of which dated as early as last September, when there was no indication whatever of a money scare," says R. E. Olds, president of the Reo Motor Car Co.

"Confronted with this condition, and with orders coming in constantly from new and unexpected sources in every section of the country, we have been obliged to very materially increase our capacity for the building and shipment of Reo cars. Our factory employes now number 1.100. These have worked steadily all winter, and now we are employing additional men in order to make good absolutely our positive guarantees of prompt deliveries.

"These facts fully justify the extensive plans which we laid earlier in the season. It will be recalled that we announced to our dealers and to the trade in general, when the money scare was at its height in October, that there would be no halt in the Reo factory, but that it would continue to build cars up to its maximum capacity. We believed then, as we do now, that the causes which led up to the recent industrial upheaval were not fundamental, for no material changes had been wrought in our governmental policies, state or national. Having undergone the period of recuperation and readjustment which was but a natural outcome of the many excesses and extravagancies to which, we, as an abnormally prosperous nation had permitted ourselves to get into, the business pendulum has been steadily swinging toward the normal. The recuperative process, like recovery from a severe nervous shock, has necessarily been slow, but has been as certain as sunshine follows showers.

"Our last November and December shipments far exceeded those of any previous year. January and February shipments were equally gratifying. The result is that we have not only sold every car contracted for when prosperity was at its height six months ago, but our factory is now actually being crowded to supply the scramble for high-grade, moderate priced cars, which we fully anticipated months ago would follow the temporary period of adjustment."

Automobile Ambulance for Kings County

The New York branch of The White Co. has recently sold an ambulance to the Kings County Hospital of Brooklyn. The ambulance consists of a standard 30 horsepower chassis with a body similar to those of the ambulance previously furnished by The White Co. to the Federal Government.

BIG CROWD AT ATLANTA HILL CLIMB

All the Events Closely Contested and Unmarred by Accident—The Only Mishap a "Between the Acts."

Under the scorching rays of the sun, and standing in dust an inch thick, 3,000 persons watched the second annual hill climbing contest on the Stewart hill, Atlanta, Ga., Saturday afternoon last, 28th inst. Nearly 500 cars lined up the sloping roadway. Only one accident occurred and that did not mar the contest as it happened after an event, when the competing cars returned down the hill. One of the cars got away and broke several lamps and fenders on cars lining the course before it finally stopped. Lieutenant Robinson, of the county police was in the car until it bumped another. The lieutenant executed a flipflop and fetched up against a convenient lamp. It broke his fall but cut his chin.

Altogether the affair was a success; there was not a hitch from start to finish. Timing was done by electrical apparatus and the mounted county police rendered efficient service in keeping the course clear. Only one protest resulted—in the free-forall, the time made by the winning car being questioned by John K. Kiser, who finished second. As all the watches recorded alike it is doubtful if the protest will be allowed. Stewart hill measures nine-tenths of a mile.

Although the events were not scheduled to start until one o'clock, spectators gathered at the course as early as 11 o'clock—and brought their lunches with them. Atlanta's best society arrived later, in automobiles, and without the lunches. According to local information "some of the most famed beauty of the South and State was there, and automobile enthusiasts had come from near and afar," so that Atlanta's second annual climb doubtless was the most "scrumptious" ever held.

All the events were closely contested, most notably the class for cars costing \$2.000 and under, in which Joe Landers, Reo, beat C. E. Travis, Cadillac, by the narrow margin of one fifth of a second in 1:293/5. J. P. Grady, Pope-Hartford, won the class for cars under \$3,000, covering the incline in 1:06%; he was second in the \$4,500 and under class, and third in the freefor-all. C. C. Rooney, Thomas, was first in the \$4,500 and under class, finishing in 1:07%. The fastest time of the day was made in the free-for-all, which went to A. L. Almand, Stearns, in 511/2 seconds. This time was protested by John K. Kiser, who finished second in a Thomas Flyer in 54 seconds. The class for cars costing \$1,000 and under went to William Oldknow, Buick, in 1:201/5, with M. C. Huie, Ford, second, in 1:28. The summaries:

Automobile Track Planned for Zion.

Salt Lake City automobilists will have an elaborate club house and a mile banked cement track, involving an outlay of about \$11,000, if present plans materialize. According to advices from Zion it is proposed to erect a large club house near Beck's Hot Springs, 150 acres of ground already having been purchased, it is stated. A mile track will be constructed of natural cement, of which there is a mountain close by the proposed site. The track will be constructed to hold a speed much less than a mile a minute with six cars abreast. A grandstand to accommodate 7,000 also will be constructed. None of the promoters of the project are mentioned, but it is stated that the movement has been under way for two months, the only reason that it was not announced before being that the promoters wanted to be sure of the project before making their plans public.

Fall River Automobile Club Incorporates.

The Fall River Automobile Club has been organized and incorporated in the Massachusetts town of that name, with the following officers: President, DDr. George L. Richards; vice-president, Early P. Charlton; secretary, Arthur S. Phillips; treasurer, Albert A. Harrison; directors, Earle P. Charlton, Robert Marshall and John P. Hilton, for three years; George L. Richards, Edward J. Jennings, and Edmond Cote, for two years; H. C. Talbot, G. D. Flynn and Edward B. Remington, for one year.

Automobile Club of Philadelphia Election.

The Automobile Club of Philadelphia has elected these officers: President, Powell Evans; vice-president, Stedman Bent; secretary and counsel, S. Boyer Davis; governors, Stedman Bent, S. Boyer Davis, George B. Linnard, Isaac Starr, Henry P. Bailey, Powell Evans and Jacob B. Seeds.

FOR FIRST AMERICAN SPEEDWAY

Utah Plans One from Salt Lake to Salt Air—Big Interests Unite and Will Organize a Corporation.

A \$40,000 private automobile speedway along the tracks of the Salt Lake and Los Angeles railway from Salt Lake City to Salt Air beach is now an assured thing. At a preliminary meeting held by the Real Estate Association of Salt Lake City last week, the first steps were taken toward perfecting a permanent organization, and a large block of stock was subscribed for by those present at the meeting.

It was decided to incorporate a company for 500 shares at a par value of \$100 per share. Four hundred shares are to be placed on the market and one hundred shares held in reserve in the treasury. J. R. Walker and Jacob Moritz were appointed a committee to canvas the automobilists to dispose of the stock.

J. E. Langford, manager of the Salt Air Beach Co., was present at the meeting, representing the railroad, which he said had authorized him to give the right of way along the tracks for the automobile speedway, and also said that the company was ready to sign an agreement to keep the speedway in repair for five years and to police it. The railway company also will haul the shale for the construction of the road, providing the speedway is put into operation before the opening of the Salt Air beach season. It will be constructed from a lime formation, found on the shores of the lake near Salt Air, which is practically dustless and packs like natural cement, and with two or three coatings of oil, will make an ideal speedway, it is said. The nearness of the source of supply will contribute largely to rapid construction.

The speedway will be fifteen miles long, with a mile straightaway. It will be exclusively for automobiles and motorcycles, with no limit to speed. Those who do not belong to the association which will build it will be charged toll for its use, and it is thought that enough toll and percentages from the railway company on race meet days can be collected during the season to more than keep the road in repair. A garage and stalls will be built near the Salt Air pavillion, and a platform will be extended to the pavilion in order that cars may be run to the entrance of the resort.

The Salt Air Beach Co., which is closely allied with the railway company, has also announced that it will build a mile track for automobile racing at the resort, and that work upon it will be started as soon as the speedway becomes a realty.

The proposed Salt Lake-Salt Air speedway is worthy of note for the fact that it wil be the first automobile speedway of its kind in America.

BIG COST OF FREE MOTORING

How "Don't Care" Usage Piles Up Expenses—Figures that Would Make

Private Owners Gasp.

In very many respects the man who uses a city owned automobile is a fortunate individual. He has the pleasure of its use without having to consider the cost or caring what the bills amount to. While, undoubtedly, it is true that the general public look upon the city's motor cars as a costly appendage of the various officials who are supplied with automobiles, it also is true that very few persons know, even approximately, how much of the taxpayers' money is required to meet the expenses of some official work and very much "joy riding."

Obviously the cost of maintenance of the automobiles varies greatly in the different departments. Much depends on the chauffeur, and the care he gives his car, but it plainly is seen that mileage is an all important factor in the total expense of running. If-and the "if" is a great big onethe city's cars were used only by city officials, when performing the duties of their respective positions, the cost to the taxpayer would not compare unfavorably with the maintenance cost of the private owned equipage. But the wear and tear on the cars that belong to a municipality vastly exceed the wear and tear on cars which are driven by chauffeurs who are required to observe the traffic regulations, who by this very observance are relieved from the necessity of sudden and violent stopping, which is an important factor in the upkeep of a car, when traveling through the streets where the traffic is heavy.

Manifestly it is impossible to compare the cost of maintenance of city owned machines with those that are the property of private individuals. But figures extracted from the official records of New York City showing the running expenses of the automobiles of various departments of New York City, give the citizen the opportunity of knowing just what the city officials are spending on this one incidental of their position, and are valuable as demonstrating the expense of maintaining an automobile when operated by men who, for obvious reasons, "don't care what it costs" and who, generally speaking, have no regard for the abuse to which it may be subjected.

In the year 1907, the Department of Street Cleaning spent \$19.039.31 in maintaining four cars—an average cost per car of \$4,759.83. As this department houses its cars in its own stables, and does its own repairing, thereby doing it at actual cost, and as the department furthermore is in position to make many of the parts that from time to time are required, in its own machine shops, it is apparent that enormous mileage, or unusual abuse, were encoun-

tered in the course of the work, or that an amount of "joy riding" was indulged in that, to say the least, is amazing. Great as it is, however, this amount does not cover, the cost of the transportation of the department officials to whom are assigned the four machines. For in addition three of these officers have horse drawn vehicles and drivers exclusively for their use. The cost of their getting about must therefore cost the tax payers a sum that simply is prodigious.

The Police Department, with three touring cars, and one recently acquired runabout, spent \$8,632.50 in 1907, which amount covers maintenance, but not original cost. Unlike the Department of Street Cleaning. this department had garage bills to pay and had its repairs done by outsiders, which involved a far greater expense than would have been incurred had they been able to do the work themselves. The cost of repairs alone was over \$3,500, whereas the Street Cleaning Department kept four cars running for considerably less than this sum, having spent but \$2,739.68; though this latter item does not include the salary expense as the repairing was done by chauffeurs, of which there are ten. In the Police Department the cars are driven by regular patrolmen, who are detailed by the commissioner for the work, their salaries being paid out of the fund for police duty. Among other items there is also the record of an expenditure of \$22.50 for a fur coat for the first police deputy, but whether this is charged to repairs, renewals or supplies, the books do not show.

In contrast to the amount spent by the police and street cleaning departments is the comparatively small cost of maintenance in the Department of Health. As far as could be determined by a close inspection of the books in the office of the comptroller, this department spent in 1907 \$11,-328.68, which, though more than was spent by the police department, is a smaller sum per car, as the health department is credited with possession of eight automobiles, and if the money was divided amongst all of them the average per car would be but \$1,416.08, a third of what it cost the street cleaners, and but half as much as the police spent. There are, however, only four chauffeurs employed—as such—by the Department of Health, so that if all of the eight cars were in use they must have been driven either by the persons to whom they were assigned or by employes who received their pay for some other duty that was not performed while they acted as "automobile engine man"-the city's official designation of those employed to handle its motor cars.

Of all the automobiles that have been attached to the Department of Health, or, for the matter of that, to any city department, there has been none that is even mildly comparable with an ambulance, which was bought with the intention of using it as a source of income. The idea was to charge each patient \$2 who might be transferred

from one point to another, and as it was used for contagious diseases, there is no suspicion that it ever was even remotely employed for "joy riding." This automobile ambulance cost \$7,600, and was used for one year, the chauffeur receiving \$1,200 and "find." During the year, 802 patients were carried, presumably for \$1,604. Then the ambulance was sold at auction for \$165. The purchaser of it sold it inside of five minutes for \$265. According to the books, the cost to the city for the use of this ambulance for one year was over \$8,800.

But for economy, real, simon pure, downright all-to-be-praised economy, the Department of Water Supply, Gas and Electricity must be singled out as an example of all that is good and pure and holy in the matter of running and maintaining automobiles -that is, if figures don't lie. An exhaustive search of the entire records of that department as shown in the books of the finance department for 1907, reveal an expenditure of but \$1,749.06, which divided between five cars gives an average cost per car of only \$349.81, about the price of one complete set of tires. The accounts of the department, however, fairly bristle with items like this: "John H. O'Brien as commissioner, amount of requisition for incidental expenses, \$500," but as no explanation is attached showing the nature of the "incidentals" it would not be fair to assert that any or all of these \$500 "incidental" entries apply to the automobile account. The accountants in the comptroller's office could offer no explanation of the "incidental" items, and they could not explain the absence of gasolene and other charges usually found in the accounts of departments owning automobiles; in fact, Mr. O'Brien's "incidental expenses" are so numerous and so uniformly placed at the round sum of \$500, that an official examiner might bring up some interesting details were his probe inserted very deeply.

In the absence of any data showing the mileage of the different cars it is impossible to determine with any degree of accuracy whether the running cost is abnormally high or whether the mileage was made at a cost per car mile which would compare favorably with the cost of individual owned machines.

Another interesting item in the expense account of Commissioner O'Brien's department is one . . . runabout, \$995. The name of the car is contained in the records and the list price is more than \$1,700, which makes it appear that the purchasing power of some individual in the department is sufficiently marvelous to cause comment or that——.

It is hard to believe that the latter can be the case. One thing that is responsible for an unusually high price which the city pays for almost everything that is bought for its use is the length of time which elapses before the bills are paid. A merchant must wait from two to six months before he receives the money for goods

sold, or services rendered, to the municipality. Because of this delay, and because too of the amount of red tape involved, rendering bills in triplicate, conforming to certain forms in making out statements, giving their wares certain titles, etc., there are many business houses which not only do not want the city's patronage, but refuse absolutely to sell to it. On this account it frequently becomes necessary to enlist the aid of a third party, a middleman, who can buy of the maker and is willing to sell to the city and carry the account for an indefinite period. Naturally he does not do this sort of thing because of philanthropic motives and sometimes, when the dealer's discount from the maker is too small to compensate for the nuisance of conforming with the city's rules and waiting for the bill to be paid, the government is compelled to pay even more than the list price, and perhaps the middleman can not be fairly condemned for it. In the matter of automobile parts this sort of thing frequently occurs, as it is necessary to obtain the parts of a certain make of machine, from the manufacturer of that machine, and if he will not carry the account then some one must be paid to carry it, as the needed articles are made by only the one maker.

Since 1904 the various city departments have been supplied with 81 cars at a total cost of \$195,003.50. Many of these have found their way into the junk pile and have been sold at auction, as the law compels, and brought prices that would about pay for junk. Some of the "auctions" are "fixed," some are honest, but it is seldom that a car brings anything like its real value when sold in this way.

The following figures show the expenditures of the various departments for cars during the past four years:

Department. No	. Cost.
Dept. of Street Cleaning 8	\$21,714.00
Dept. of Public Charities 2	6,000.00
Board of Education 1	4,700.00
Fire Department 7	21,250.00
Dept. Water Supply, Gas and	,
Electricity	7,277.00
Police Department 6	15,185.00
Dock Department 2	5,775.60
President Borough of Man-	
hattan 3	14,000.00
Department of Parks 6	17,340.00
President Borough of Brook-	
lyn12	16,040.00
President Borough of Rich-	
mond 7	13,086.90
President Borough of Queens 3	8,800.00
President Borough of The	
Bronx 1	4,000.00
Department of Correction 1	2,500.00
Department of Bridges 4	8,142.00
Department of Health 8	19,908.00
Department of Finance 5	9,285.00
Total 81	\$195,003.50
Total81	φ1,50,000.50

It is a matter of considerable notoriety that "joy riding" plays no small part in the usage of not a few of these cars. It is common talk that one of them is used by an official's wife for shopping and other personal purposes, and not long since one of the prominent city officials was arrested while using a city car in New Jersey.

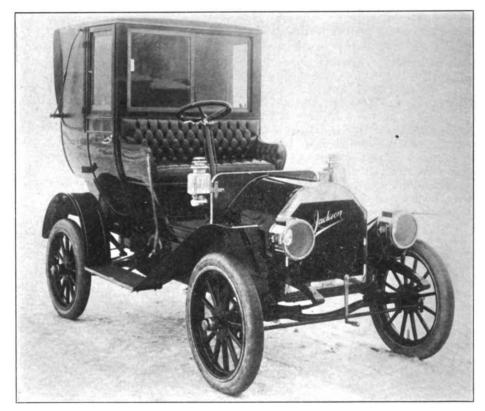

THE MOTOR WORLD

NEWEST AMONG THE TAXICABS

Jackson Enters the Lists with an Attractive
Vehicle—Prominent Details in the
Design and Construction.

Thanks to the stimulus of the increasingly popular taxicab, a considerable number of makers have already produced vehicles answering to this description, while the rapid sequence of additions to their ranks points to the probability of a time not far distant when every maker with pretensions to anything like an inclusive line, will number at least one such vehicle in his catalogue. The most recent acquisition to the ranks of the liptic springs behind, and semi-elliptics in front, and is propelled by a 16-horsepower, two cylinder motor, driving through a planetary change speed gear, and propeller shaft, to the live rear axle. The transmission is geared for a speed of 25 miles per hour, and the control mechanism is so designed that it may be actuated largely by means of the feet, thus facilitating the management of the vehicle in close street traffic.

The body takes the form of a neat and compact landaulet with inside carrying capacity for four passengers. Its general appearance is considerably relieved by the absence of complicated external mechanism either of propulsion or control, and its serviceable and unostentatious exterior is an able recommendation for it as a worthy

JACKSON TAXICAB. THE LATEST COMER

American built taxicab-which must invariably be read as synomous with light closed town car-is the newly announced product of the Jackson Automobile Co., Jackson, Mich., which is here illustrated. Unlike many other vehicles which have been produced, the new Jackson is a vehicle built on thoroughly economical lines, designed for economical service, and though, as the makers explain, in no sense a "cheap cab," it is yet sufficiently modest in its properties to be appealing at once to the private individual who has regard for the cost of his motoring mileage and the corporation which is forced to do so in order to realize the all-ellusive profit on its in-

The cab is built on a light chassis having 90-inch wheel base and 30-inch wheels, shod with 3½-inch tires. It is hung on full el-

member of a rapidly growing class of serviceable vehicles, adapted either to the use of individual owners or to the service of the general public.

Punctures Frequent on Chicago Taxicabs..

Are Chicago's "horse cabbies" seeking to disable their rivals in the business, the drivers of the taxicabs, by puncturing the tires of the latter vehicles? Chief of Police Shippey intimates they are doing so, by commanding officers to keep a sharp lookout for "some persons who are maliciously jabbing knives and nails into the tires of the taximeter cabs." T. J. Doyle, secretary of the Cab Drivers' Union, resents the aspersion and says that the taxicab tires are cut because the drivers are new men and haven't sense enough to keep from running over broken glass.

SOLVING THE HAULAGE PROBLEM

Most Recent Development of the "Road Locomotive"—Practical Evidence of What It May Become.

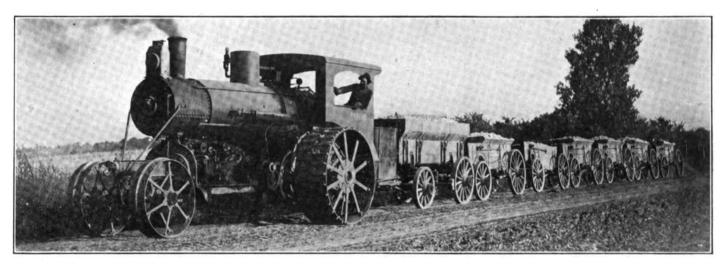

While the haulage of merchandise over the common highway is generally recognized as one of the most important phases of the transportation problem of the future, the fact that it has assumed proportions of considerable magnitude already in some parts of this country, as well as abroad, is not generally known. The use of motordrawn traction trains has been applied with varying degrees of success in England and in investment and operation being very great. Unlike most "commercial motor vehicles," the engine is evidently a direct derivation from railroad practice, and is a road locomotive in the fullest sense. Far from being in any way a relic or copy from railroad or traction engine practice, however, it represents the most recent development in a line which is receiving far more attention than the average "man in the street" is at all aware.

Compared to this, and the 20-ton gasoleneelectric road train shown at the recent automobile show in Madison Square Garden, not to mention other enterprises of a similar nature, either in practice or under way, the undertaking of producing a single vehicle capable of transporting loads of five

EVIL EFFECTS OF COMMISSIONS

Their Relation to Tire Wear and Cost of Maintenance—Demoralizing Influence on Chauffeurs.

"I used to wonder why my tire bills were so large," remarked a man who had owned several cars. "They were absolutely abnormal—not the price of the tires but the frequency with which I had to buy new ones, and as the maintenance of my car, aside from the tires, was reasonable, I set out to find out why I was getting such poor service from tires that were of excellent reputation, high priced and bought direct

AVERY ROAD ENGINE DRAWING A LOAD OF 35 TONS

on the Continent, for many years. In America, particularly in the Western States, it is by no means uncommon, though not as general as in Europe, where highway conditions are more favorable and railroads less accommodating in the matter of rates and schedules. Even with the common American highway conditions to contend against, however, the transportation of heavy loads over considerable distances is a distinct and economical possibility which is neither to be questioned nor ignored.

The accompanying illustration from the Good Roads Magazine, affords tangible proof of what may be done with commercial success. The tractor shown, is an Avery undermounted road engine, differing from the more or less familiar traction engine in that it is designed primarily for haulage purposes, and not as a portable power plant capable of autolocomotion. The combined load of seven trailers represents a total of 35 tons. The view was taken on the Pocona Hill road, near Omaha, Neb., and the burden is that most "dead" and inelastic of all cargos, crushed rock.

Figured on the normal allowance of one ton as the average load for a team of horses, it will appear that the outfit in question is replacing no less than 70 horses and 35 drivers, the evident economy both

tons, more or less, seems comparatively simple. Those who are accustomed to predicting a great future for the commercial motor vehicle, would do well to bear in mind that that "future" is by no means a distant one, and that much which is highly creditable already has been accomplished. How great the ultimate achievement will be is impossible to foretell.

Californian Creates a Motor Truck.

Arthur Mills, of Ione, Amador, County, Cal., has invented a motor truck which he hopes to market with the supervision and financial aid of W. H. Rutledge and others, under the name of the Sacramento Motor Truck Co. The most striking features of the vehicle, which is a sort of family affair, having been commenced by Mills's father prior to his death and later finished by the son, are its close resemblance to a horsedrawn dray, and the fact that it is equipped with ordinary wagon wheels, shod with steel tires. It is driven by a 15 horsepower gasolene engine mounted in front, and connected with the rear wheels by a system of bevel and spur gearing, the final connection with the driving wheels being by means of pinions and annular gears with independent clutching devices by way of differential provision.

from the makers; I add that last to explain that I was not patronizing cut rate houses and buying job lots.

"I looked into the subject pretty thoroughly; talked with friends who had had more experience with automobiles than had I, and finally hit on a clue which led to the entire explanation. My chauffeur was a rascal, as some of them are, and I learned that he was getting commissions from the tire makers on all tires that he bought. Acting on a tip given me by a friend. I watched his driving without letting him know that I was doing it, and I saw that he would drive in car tracks as much as possible or run two wheels on the trolley slot whenever he could. That brought some light to me and when I found that he would drive close to curbs so that the tires would rub them, and that in crossing the bridges he hugged the guard rail of the roadway which tore the shoe whenever a nail or rough, wooden projection was encountered, I fired him. Then I went to the manufacturer and had a heart to heart talk.

"I told him that I was not especially interested in the subject of giving 'presents' to chauffeurs, if that was all there was to it, but when the chauffeur put me to large expense so that he could receive small presents, I was vitally interested and asked him

INFLATING PRICES TO CUT THEM

Bargain House Method of Making Big Discounts—Their Alleged "List" in Comparison with Regular Trade Lists.

Charles E. Miller's new catalog, made up of 216 pages and, if anything, more complete than any of its predecessors, made its appearance this week. Miller makes the issue notable by suggestive reference to the so-called discount houses, whose tricks of increasing list prices in order to make their discounts appear enormous is not wholly

"The so-called 25 or 50 per cent. supply houses cannot quote this discount from the prices in our catalog," says Miller's publication, "although they may be able to quote a big discount on joblot or second hand material, or from fictitious or inflated list prices. We guarantee to furnish new material at standard prices and do not substitute or offer something 'just as good.'"

Just how the "list" prices quoted by the discount houses are inflated, was demonstrated by the comparison with the prices printed in the catalog of one of them with the manufacturers' actual list prices. The instances are rare where the advertised "list" in the so-called cut rate catalog is not vastly in excess of the list published by the makers of the goods. In other words, the "list" quoted by the price-cutters is a "list" which exists only in their minds and is published with the intent of fooling purchasers into the belief that they are getting an enormous discount, which is far from true.

In making the comparison of prices, care was taken to compare only standard articles of the same quality or size. The prices in both colums refer to the same article, not to articles made by different makers. A few of the comparisons follow:

	Cut	
	Price	Makers'
	"List."	List.
Horn No. 1	\$25.00	\$20.00
Horn No. 2	3.00	2.50

How Spare Shoes Can be Kept Dry.

The importance of keeping dry the spare shoes carried on an automobile is, of course, generally realized. But evidently very

many drivers conclude that to cover a shoe with a tire case is all that is necessary to keep the moisture out, yet this is not all that is required. Nearly all tire covers are so arranged that, while the back or body of the cover is in one piece, there are two flaps. The object of this arrangement is to permit of the openings being in the same direction, i. e. down. The upper flap buttons over on the rim side of the tire and it overlaps the lower flap which also may be buttoned down-if one may use that expression. In putting the covered tires in the tire holders care should be taken to have the openings in the flaps on the under side, in which position rain will not run in on the shoes nor will they become wet during the process of washing the

Manographe Appears in America.

Hugo C. Gibson, one of its members, has presented to the Automobile Club of America, a Hospitalier-Carpentier manographe, an instrument of recent invention which produces, by photographic process, diagrams showing accurately what takes place within a motor cylinder, so far as the pressure is concerned.

A ray of light is projected upon a prepared plate by a vibrating mirror. Its horizontal movement is controlled by a flexible shaft, which is connected directly to the crankshaft, or in such a way that it revolves in unison with same. The vertical movement of the beam of light is controlled by the pressure in the cylinder, the inside of which is connected with the instrument by a tube. The combination of these two movements causes the beam of light to travel in an irregular line upon the prepared plate, recording the pressure at every point of the piston's movement. The diagram thus produced enables the engineer to determine the horsepower which is being exerted within the cylinder walls, the pressure at the inlet, exhaust and compression points, and to note also whether the valves are properly timed.

New Material Produced for Brake Lining.

Thermoid is the name of a new brake lining which is pronounced by a number of automobile makers who have tested it to be about the best thing of this kind yet produced. It is made of a combination of asbestos interspersed with layers of rubber and strips of thin copper wire. In factory tests a section of the material has been placed over a pulley with a sixty-pound dead weight attached, the pulley traveling about thirty-one miles per day. After a run of over 40,000 miles the strip of Thermoid showed no appreciable wear, being simply worn smooth. It is claimed that it will outlast even the metal brakes themselves, and so confident are its makers, the Trenton Rubber Mfg. Co., 2900 Grove street, Trenton, N. J., regarding its merits that they are willing to send samples and submit to the hardest kind of tests.

what he was going to do about it; and just to put the thing in a proper light for him to see it, I told him that I had about concluded that his tires were no good, that they did not give me the mileage that other tires did for my friends and, I added, that if I hadn't discovered that the fault was with the chauffeur he would have lost a patron and that I would, in all probability, have advised against using his tires when others asked my opinion of them.

"Naturally he saw the light. He said that he hadn't thought of it in that way before and he promised to pay no more commissions to chauffeurs in my employ. Since that interview I have had no excessive tire bills and I compel my chauffeur to get tires at this concern's store. And the chauffeur, finding nothing in it for him, has no object now in giving them obnormal usage."

Chauffeurs Organize "for Protection."

Cincinnati's chauffeurs are aroused over the founding of a school whose promoters claim they can teach a young man to be a proficient chauffeur in 24 lessons of two hours each. It caused the professional drivers of that city to meet last week for the purpose of forming a protective association. James B. South presided. He declared that the proposed association is not to be a labor union and does not propose to dictate as to hours or wages. "Our purpose is mainly to have an organization where we can take united action in any case where the rights of chauffeurs are threatened," he said. "The chauffeur is more than merely a driver of a machine; he is an experienced mechanic." A committee was decided to to draw up a constitution for the Chauffeurs' Association, as the new organization will be called.

To Clean Light Colored Leather.

Automobiles that are upholstered in light colored leather frequently present an appearance of untidyness which can be easily overcome. To clean and remove stains from light colored leather the following mixture may be used with good effect: Boil a pint of milk, let it cool and add one drachm of hydrochloric acid and one drachm of sulphuric acid. Shake well and then add half a drachm of oil of lavender, one pint of vinegar and the white of one egg beaten to a froth. Keep in a tightly corked bottle. Rubbed on the leather with a soft cloth it greatly improves the appearance and removes the stains.

Convenient Tank for Testing Tires.

For testing tires, an ingenious Indiana dealer has the water trough built into the floor of his shop, a tin tank fitting into the opening thus made. The tank thus is removable for cleaning. The trough is provided with a lid fitted with a ring. A trough of the sort, being flush with the floor is always instantly available and at the same time is never in the way.

INVESTIGATING THE WHEEL SLIP

Another Series of Experiments at the Brooklands Motordrome—What They Appeared to Demonstrate.

Wheel slip in connection with the other problems of motor car design, is a subject which, oddly enough, has not as yet come in for its full share of attention. There can be little doubt that considerable slip actually does take place, nor that its existence is an accurate measure of the principal cause of tire wear. But the absolute amount of slip which takes place under ordinary circumstances, and how it is governed by conditions of speed, load, and road surface, never has been investigated to its full value. A beginning in this line has been made, however, on the English Brooklands course, and by the irrepressible S. F. Edge. That these trials are only a very small beginning, and really show little or nothing of the underlying truth of the matter, is apparent from published accounts of them.

The trials just completed, which are announced as the forerunners of a series of more complete tests to follow, consisted merely in driving a car over the Brooklands course at varying rates of speed, and observing the number of revolutions made by the engine in each case. To this end, a special form of revolution counter was attached to the two-to-one shaft of the engine of a racing car, and the machine was first towed over the course, each lap of which, when followed at a certain distance from the pole measures about 25% miles. After the first lap had been made in this way, the succeeding laps were run off under the machine's own power, the recorded revolutions made for each lap, being set down for comparison.

Counting the slip as zero for the lap when the car was towed and no power was being exerted by the engine, it was found that at 30 miles per hour the difference in revolutions between that and the first lap was 40, that is to say, that the engine had turned over 40 times more when driving the car at 30 miles per hour than when the car had been idly towed by another machine. Similarly, when running at 60 miles per hour, the "slip" was found to have amounted to 72 revolutions for the single lap.

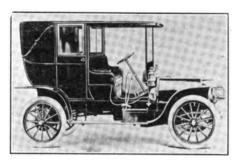

It is to be inferred that the gear ratio was unchanged during the entire test, and that the clutch was permitted to seat firmly at all times, though neither of these facts is brought out in the reports. Furthermore, as the car was run always in the same direction, and as nearly as possible in the same track, it is to be inferred that differential action due at once to the curve of the course and possible deviation from the normal path, was largely neutralized. The fact that the slip at 40 miles per hour, proved to be less than that at 20 miles per hour, however, tends to discredit the entire perform-

ance. The results of the test are as follows:

Test Speed. No. m.p.h.		Engine Revs.	engine revs.		
1		3.732			
2	slow	3,748	16		
3	20	3,776	44		
4	30	3,772	40		
5	40	3,770	38		
6	50	3,790	58		
7	60	3,804	72		

Franklin in the Taxicab Market.

The H. H. Franklin Mfg. Co. has entered the field of the taximeter cab with a new closed body machine, the G landaulet, a 16 horsepower motor car, which is the lightest landaulet on the American market. A number of these are now being tested in

city service. The short wheel base of this motor car, only 92 inches, makes it an exceedingly handy machine for crowded city traffic. It is built on the chassis of the Franklin 16 horsepower touring car, with progressive transmission and jump spark ignition from a battery, along the lines of the 28 horsepower landaulet. It is upholstered in soft black morocco, as being more sanitary for public service. This machine weighs only 1850 pounds, and sells for \$2,500.

Whirling Liquid as Speed Indicator.

The Miloscope is the designation of a new speedometer which just has been placed upon the British market, and which is constructed in accordance with a principle which it is claimed has not before been applied to such a use. The idea is merely that of whirling a body of liquid in a closed container and using the height to which it is driven upon the sides of the vessel as an indication of its speed. The entire part of the device containing the liquid, revolves as a unit, there being no vanes or other parts which turn at different rates of speed. Therefore the problem of preventing leakage is a comparatively simple one. There is but one ball bearing which supports the moving part, and because of the simplicity of its construction and the small weight in motion, the indications are practically "dead beat," and accurate. It is friction driven from the front wheel of the vehicle in the usual way, the resistance of the flexible shaft being practically the only friction encountered. The graduations are for speeds of from zero to 50 miles per hour, and the scale is 41/4 inches long.

FIRE PRECAUTIONS IN PAINT SHOPS

Their Necessity Emphasized by Large Aggregate of Recent Losses—Careful Cleaning up as a Safeguard.

Recent losses from fire occurring in automobile paint shops, approximating \$150,000, directs attention anew to a very dangerous and an exceedingly expensive oversight on the part of those having charge of such establishments, remarks a well known journal of the carriage trade. Spontaneous combustion is no new creature of the fire underwriter's fancy. It is well known in carriage painting annals, and is properly regarded as a large and unmistakable source of danger by carriage painters everywhere.

At best, the automobile paint shop, which is not infrequently, through manifold exigencies, some undesirable section of the city garage, is not conducive to safe painting operations, being beset by automobile repair men of various branches and equally various inclinations relative to matters of safety, and holding in its more or less ill adapted depths specially inviting recesses for the development of unexpected combustion.

On this account, not to mention others which intervene, the automobile painter is confronted with a situation which he can ill afford to disregard. Without permitting location of shop, its environment, equipment, or arrangement of furnishings, to influence his better judgment in respect to safeguarding the premises, it is his first duty to exercise the utmost diligence in keeping the shop clean, at least during the hours it is unoccupied by the workmen, of all waste, greasy, or oily, or paint smeared rags or fabrics of whatever sort. As a matter of fact, such fabrics should not be allowed to lay or be thrown around promiscuously during working hours, much less during the hours when no vigilant eye or keen-scented olfactory is abroad. All paintsmeared, or oil and turpentine or benzine saturated cloths, waste, burlaps, etc., are more or less dangerous, the first named being possibly the least so of all. Oil and turpentine combinations are, if anything, the most dangerous of all, with benzine, on account of its explosive nature, standing a close second. Even excelsior, tow, and common soft wood shavings containing wood filler, will ignite upon slight provocation. It is, therefore, a safe policy at all times and under all conditions to keep refuse matter, including all of the abovenamed, closely picked up, and, while left in the shop, stored in metal buckets with closefitting covers attached. These should invariably be removed from the shop at the close of every working day, and the contents disposed of. Such precautions are inexpensive and besides being conducive to safety, foster a spirit of cleanliness.

DON'T WANT TO SET FOLKS CRAZY

Massachusetts Legislature Rejects "Continuous Noise" Bill—Law Passed Permitting Hill and Road Contests.

Out of the big grist of automobile measures poured into the hopper of the Massachusetts legislative mill only three thus far have passed through the chute known as the committee on roads and bridges. These include one that not only was unjust to owners of motor vehicles, but also was of a character which did not recommend it to any one but the most rabid anti-automobilist. This was the bill calling for some device on automobiles and motorcycles, to sound continuously when the vehicles are in motion. The committee reported "leave to withdraw," and the report was accepted after some debate. During the discussion Representative Cook of West Springfield made his first speech of the session, in defense of the report. Replying to an inquiry by Representative Burr, of Boston, as to reasons for the adverse report, Cook said, with some vigor, "The reason was that we didn't want to set everybody in the State crazy. If anybody has got any good reasons for this bill it's about time we heard

Another of the bills reported on, and with a recommendation for its passage, was the one permitting the mayor of a city or the selectmen of a town to grant permits under which automobiles may be driven on specified highways for a given length of time at any speed. This bill was asked for by the Worcester Automobile Club to enable it to revive its annual hill clomb, but under it there is a possibility of other road contests. This bill went through both branches of the Legislature and last week was signed by Lieutenant-Governor Draper.

The other bill reported on was that of E. Wentworth Prescott to provide that all vehicles using the highways after dark should carry lights. The report was referred to the next General Court. The automobilists are strongly in favor of this law and have urged its passage for several years past. At the hearing this year there was no opposition, but the committee seems to feel that a little more time should be given the rural population that it may learn the benefit of such a law. There is another "lights" bill before the committee, but it is probable that having reported adversely on Mr. Prescott's bill it will take similar action on the other.

The majority of the bills still under consideration are those proposed by the Safe Roads Automobile Association. These have been referred to a sub-committee for the purpose of making a redraft which shall include the desirable parts of all the different measures.

That part of the Governor's inaugural ad-

dress which dealt with automobiles, in which a sliding scale of registration fees is recommended, has not yet been acted upon, but it does not seem probable that the Legislature will make another change in the registration law, when the new law passed last year has hardly begun to be effective. Last year the House was strongly against the sliding scale of fees and the Senate was for it. This matter has been considered jointly by the committee on roads and bridges and the committee on taxation. After the experience of the past year during which the automobile owners have paid the State from \$5 to \$12 each in registration fees another change to a sliding scale, which would bring with it still higher cost of registration, would be a blow to the automobile business in Massachusetts.

New Jersey Clubs in Annual Session.

Directors of the Associated Automobile Clubs of New Jersey met in annual session at Trenton on Tuesday, 31st ult., elected new officers, and passed one or two resolutions.

They endorsed the bill introduced in Congress providing for the erection of a bridge over Newark bay and a bill pending in the legislature which authorizes freeholders to issue bonds for the repair and betterment of roads.

The principal business transacted was the election of new officers, George W. Post, of Paterson, being chosen to succeed Wilbur F. Sadler, of Newark, as president. W. C. Crosby, of Newark, was elected first vice-president; Walter F. Edge, of Atlantic City, second vice-president, and Horace A. Bonnell of Newark, secretary-treasurer. Bonnell succeeds John E. Gill, of Trenton, who refused a renomination because of other duties; Edge takes the place of W. E. Garritt, of Newark.

The constitution and by-laws were amended, making dues payable annually instead of semi-annually. The report of the retiring secretary showed that more than 200 members have been gained in the past month and that three new clubs have been added, making a total of eleven clubs in the association.

Cocks Bill Killed in Committee.

The Cocks bill, which sought to facilitate inter-state travel by providing a Federal license for automobiles, and which was fathered by the American Automobile Association, has received its quietus. As was expected, the House Committee on the Judiciary has decided to report it adversely on the grounds that it is unconstitutional in that it infringes the police powers of the states.

The Continental Caoutchouc Co. has set aside \$1,000 as an added incentive for good performance in the Briarcliff race on April 24th. The money will be apportioned, of course, among the contestants making the best showings on Continental tires.

STEEL MAN TO BE HEAD OF A. C. A.

Entirely New Slate for Coming Election of Officers—Ticket Made up of Representative New Yorkers.

Judge E. H. Gary, executive head of the United States Steel Corporation, will be the next president of the Automobile Club of America, Colgate Hoyt, the present incumbent, having declined renomination. Excepting the hold-over governors, of whom Albert R. Shattuck is one, an entirely new board of officers will assume direction of the organization when elected on April 14.

The new slate comprises a representative list of successful New Yorkers, and chiefly because Robert Lee Morrell figures as the nominee for the third vice-presidency, there are those who see in the new ticket the means of lifting the wet blanket which has served to detract from the popularity of the big club and the cheerfulness of the big club house. But in nearly every instance it is found that it is mainly the wish that is father to the thought. Judge Gary's running mates are as follows:

Vice-President, Henry Sanderson, banker; second vice-president, William F. McAdoo, president Hudson & Manhattan Railroad Co.; third vice-president. Robert Lee Morrell; treasurer, Edgar L. Marston, of Blair & Co., bankers; governors, Commodore Cornelius Vanderbilt, Commodore New York Yacht Club; General Horace Porter, late Ambassador to France; Frederick D. Underwood, president of the Erie Railroad; Wm. Pierson Hamilton, of J. Pierpont Morgan & Co.; Waldron Williams, chairman of A. C. A. Bureau of Tours; Colgate Hoyt, present president of the club; Dr. S. Skaats Wheeler, president Crocker-Wheeler Co.

The governors who will hold over are: Winthrop E. Scarritt, Dave Hennen Morris, John Jacob Astor, George F. Chamberlin, and Albert R. Shattuck.

For World Discussion of Road Damage.

That old bugaboo of the injury which rubber tires inflict on highways is likely to receive its final and authoritative settlement next fall when an international congress of highway engineers will be convened to debate the matter and decide upon a remedy for the evil, if evil it prove to be, and of sufficient magnitude to warrant the adoption of special measures to overcome it. Because of the tremendous outcry which has been raised against the automobile on account of its alleged destructive propensities in this respect, France has issued a call for the meeting, which is to be held in Paris commencing October 11. Director Page of the office of public roads. United States Department of Agriculture, will represent American interests in accordance with an invitation recently extended through the French embassy at Washington.

THOMAS CAR SAILS FOR VALDEZ

American Leader in New York-Paris "Race"
Off for Alaska—Other Contestants
Leave Repair Shops.

Chapter One of that gay French fantasy, the New York-Paris "race," is practically finished. The only American entrant, the Thomas, after a week of exhibition and overhauling in San Francisco and Seattle, was shipped yesterday from Seattle for Valdez. Alaska, where it is expected to arrive April 6th, ready to commence what is by all accounts the most nearly impassable stage of its prodigeous undertaking yet encountered. Local pessimists and wise men from the north say the passage of even one corner of Alaska will prove impossible at this time of year; that the trails are not wide enough to permit passage of automobiles. George Scheuster, who now is captain of the Thomas crew, says it is by no means impossible to attempt it. The foreign contenders are still toiling toward San Francisco.

After the unpleasant experience at Kelton, Utah, where a delay and shipment back to the Union Pacific railroad shops at Ogden was made necessary, the Zust car and its gallant crew traveled in better luck until near Daggett, Col., where 30 hours were lost through a mistake in the course. Los Angeles was reached on Tuesday, the Italians having come through by way of San Bernardino, instead of following the Thomas through Mojave, Cal., a longer and better route thereby being secured. Just outside the city, however, an unusually high bump in the road, and the low fuel tank of the car came into contact, with the result that a lay over of a few hours was required to patch up a formidable hole in the reservoir. Santa Barbara was passed yesterday afternoon, and the Italian colony at San Farncisco is preparing a Festa for to-night.

Thursday of last week, the De Dion was overturned in the mud near Spring Valley, Wyo., and was only righted after eight hours strenuous labor on the part of the French crew, part of the work being carried on after dark by the light of a bonfire.

Later reports show that the party is making better time than either of its predecessors, Goldfield being reached on Tuesday, the 250 miles of desert between Ely and Tonopah having been traversed in 13 hours—beating the Thomas' time by a day and a half, and that of the Zust by several hours. As usual Goldfield declared a dividend and drank itself dry over the arrival of one more New York to Paris "racers." With difficulty St. Chaffray and his team—escaped after the festivities and got to Rhyolite.

Thursday, the Protos came to grief five miles west of Point of Rocks, Wyo., and as a result of a broken driving shaft, had to be shipped back to Ogden, to the shops of the ever-obliging U. P., for repairs. Four days later, it was on the road once more, as good as new-or better. It began to look as though the cars that reach Paris will be mostly of American manufacture and will bear the U. P. imprint. Monday's trip was 70 miles long. Granger, Wyo., the stopping place for the night, was left behind early the next morning. It was a repetition of the trials which had beset the other cars, however, for at 8 o'clock Tuesday night, the German lieutenant and his compatriots were reported to have gained just 20 miles on their course by dint of many more miles of circumnavigation, and to be at Carter-deep in the snow. They are now at Evanston, Wvo.

Gas-Electric Railway Car Tested.

From New York to Baltimore in 1 hour and 45 minutes is the schedule which was forced upon the Strang gasolene-electric railway car, "Irene," on its trial trip last Sunday, 29th inst., when a party of seventy railroad men, promotors, experats and bankers, were carried over the Pennsylvania railroad in the latest product of the Strang Gas-Electric Car Co., of Garwood, N. J. The car, which is the first product of the company, has a record of a mile in 58 seconds and it has bee hoped to improve upon this had not the fog interfered to cut down the running time permitted by the train despatcher. The car is driven by a gasolene engine of special construction, with an electric transmission, and storage batteries as an auxilliary equipment for equalizing the load. The car is of special form, 65 feet long, and weighs 55 tons. Five duplicate cars are in process of construction at the company's plant. Sunday's excursion was made in the interests of the system as a means of economy in suburban and interurban railroad traffic. Representatives of a number of eastern roads were present.

Route Book for Southern Tours.

The touring bureau of The White Company just has added No. 6 to the White Route Book library. The new issue covers the route from Philadelphia over the National Highway as far west as Springfield, Ohio, and then southward through the Southern States to Savannah. This book gives the first definite data ever published on the roads of Kentucky, Tennessee, Alabama and Georgia, and the road directions for following the National Highway through Maryland, Pennsylvania, West Virginia and Ohio are herein given for the first time with accuracy and detail. It is believed that this issue will do much to revive interest in the National Highway and to turn the tide of tourist travel toward the South. The new route book, besides giving detailed directions for over 1,800 miles of road, contains articles descriptive of the route, embellished with numerous illustrations. There is also a fine double-page map of the country traversed. As usual, tourists may obtain copies of the book free of charge.

CHICAGO IN CARNIVAL SPLENDOR

Decorated Parade at Night Ushers in a Week of Festival—Brilliant with Flowers and Electric Light.

With a decorated parade for a curtain raiser, in which pyrotechnics—oratorical and roman candle—siren horn music, and some little excitement played a prominent part Chicago's first "spring carnival" was ushered in last Saturday night, 28th ult. While not as large as the parade at the Indianapolis carnival a week ago, the Chicago parade was more spectacular, occurring as it did at night.

The procession started at 7 o'clock from the New Southern hotel on Michigan avenue with nearly 100 decorated cars in line and wriggled through several streets until it wound back to Michigan avenue for the final review by the judges.

By a process of elimination which lasted about one hour the judges finally got the competitors sifted down to fifteen. The judges considered that the most beautifully decorated car was the Thomas, driven by C. A. Coey, which was awarded first prize. The car was a fairyland of white and red carnations, twinkling with myriads of miniature incandescent lights, while a swaying balloon, bearing a design of the American flag in red, white and blue chrysanthemums. surmounted the car. A propeller in front slowly revolved with its twinkling lights.

The White car driven by Miss Mildred Plew, fully sustained its name. It was dressed with festoons of white roses and little lights, while the tonneau carried a mass of red and white roses. Miss Plew was a symphony in white, and caught the judges' eyes for second prize.

Carl Metzger's Woods electric brougham was a mass of white roses, while in front of the car, suspended on long slender wires was a flock of white doves, with long streamers of white ribbons extending back to the seats. It got third prize, while ten other cars received honorable mention.

Whatcom County Owners Orgonize.

Twenty automobilists last week formed the Whatcom County Automobile Association at Bellingham, Wash. There are 75 owners in the county and it is expected that nearly all of them will join the only automobile club in the county. These officers were elected: President, Dr. F. G. Chute: vice-president, Charles Daw; secretary. Ray Cissna; treasurer, Fred Offerman; trustees, the officers and Dr. Compton

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

HORSEPOWER AT REAR WHEELS

Tests on A. C. A. Dynamometer Give Some Interesting Results—Some Wide Variences with Motor Ratings.

That horsepower, the makers' rating, horsepower the actual, and the horsepower delivered at the rear wheels of the car, are subject to an even greater variation than commonly is supposed, has been demonstrated in a most spectacular manner by a series of tests which have been carried out on the dynamometer which early this year was installed at the headquarters of the Automobile Club of America. In the course of power tests applied to 17 different cars it has been demonstrated further that the most efficient performance of only a fair majority of the cars is obtained on the highest speed, while in a surprising number of cases the most powerful effort of the motor was obtained on either the first or second speeds.

Results of the tests, so far as obtainable, cover only the make, style and nominal power of the cars, and the maximum power and speed, as well as the gear on which it was developed. Efforts to obtain the powers developed on the other speeds, in every case, which would prove most instructive beyond a doubt, were met with a refusal at the office of the club secretary. Broadly speaking, the information published by the club goes to show a much greater variation in current design as regards the adaptation of gear ratios and transmission mechanisms than would appear to be the case from a casual comparison of the design and construction of the various machines. Incidentally it points directly to a desire on the part of the makers to cultivate either speeding powers or hill climbing ability, in the several cases. rather than to any great uniformity of effort in either direction. The fact that in no case, with the possible exception of the runabout, is the direct purpose of the car considered in this connection, also is interesting to observe.

Make.	Style.	Nom- inal h.p.	h.p. at	Max. h.p. at Wheels.	Miles per Hour.	Gear.
Mercedes	runabout	40	30	29	42	4th

That the publication of the results of these and other tests may lead to an entirely new understanding of the meaning of horse-power and of its application in the motor car, goes without saying. Further, that it may lead to a deeper study of transmission efficiencies than has yet been undertaken also would seem to follow.

Two of the cars developed more power at the rear wheels than the nominal capacity of the motor. Ten of them, however, revealed as much power as would be expected, supposing the loss by friction in the transmission to be 25 per cent., which it is ordinarily reckoned to be for purposes of rough calculation. Eight of these developed power at the wheels in excess of that amount, showing either a considerable underrating of the motor or very high transmission efficiency.

In fact, because of the vagaries commonly practiced by manufacturers in the matter of engine rating, as well as the lack of common knowledge as to the exact ratio of power lost in the transmission of one or another type, these figures are not subject to analysis with any degree of exactitude. In any case, the horsepower and speed developed represent the difference between the actual power of the engine and the resistance of the transmission. Where neither value is known exactly, the result must be accepted rather as an isolated fact, than as a conclusion which is worth more than its face value. Were it possible to obtain the performance of the cars under all driving ratios, more satisfactory information might be deduced from the tests. The purely illustrative value of the results, however, is not in the least affected by this objection.

The figures in the following table are self-explanatory with the single exception of those given in the fourth column, which represent the power which would be delivered at the rear wheels in each case were the transmission efficiency 75 per cent., or were three-quarters of the total power of the motor delivered to the wheels. The vehicles tested were all stock machines in road condition. The Delahaye landaulet was one of the two-cylinder taxicabs in daily use in and about New York City. The results are as follows:

DECEPTIVENESS IN TOP MATERIAL

Gormully Puts Purchasers on Their Guard

—Pointers Concerning Some of the
Fabrics that are Used.

In purchasing automobile tops the majority of individual buyers, as well as a large proportion of automobile dealers, depend too much upon the general appearance of the article offered, failing to enter specifically into the quality, etc., of its constituent parts, says A. R. Gormully, purchasing agent of the Maxwell-Briscoe Motor Co. It is human nature, apparently, to take advantage of our fellow humans' failings, and some top manufacturers are, unfortunately, only too willing to take such advantages wherever possible.

The majority of tops to-day are manufactured either from one of the several makes of artificial leather or of rubber-covered duck or drill. Tops manufactured for Maxwell cars, as most of our readers probably know, are made of an artificial leather which is known to the trade as No. 1000 X Moroccoline. Many top makers are, we find, manufacturing tops which they designate as moroccoline tops, but which are, in fact, made of a lower grade of material, although it is marketed under the trade mark of moroccoline. These cheaper grades of moroccoline can be purchased at 25 per cent. less than No. 1000 X; hence, if the dealer is offered moroccoline tops at a low figure he should insist upon knowing of what grade of moroccoline the tops offered are manufactured.

Rubber drill is, also, subjected to the same variations; this material, in fact, is made as light as 20 ounces, whereas the drill used in the manufacture of Maxwell tops and storm fronts is 32 ounces; the difference in cost between these two weights be-30 cents per yard. Such substitution, of course, affords a great saving to somebody, and dealers purchasing rubber tops and storm fronts should insist upon knowing the weight of material used.

Another case of the same character is the flexible glass or transparent celluloid used in top and storm front lights. This material is made in various thicknesses ranging from 5-1,000 of an inch up. The celluloid used in Maxwell tops is 15-1,000 of an inch thick and lists at \$1.10 per sheet, whereas thinner material can be purchased, down to the 5-1,000 material, which costs only 55 cents per sheet.

The bow sockets or supports of the top are another item to which dealers should give attention; these being made in several weights; as a general rule they come in two weights for automobile usage, viz., medium and heavy, and in a very light weight known to the carriage trade as "buggy weights." These light sockets are often used where price is the main consideration.

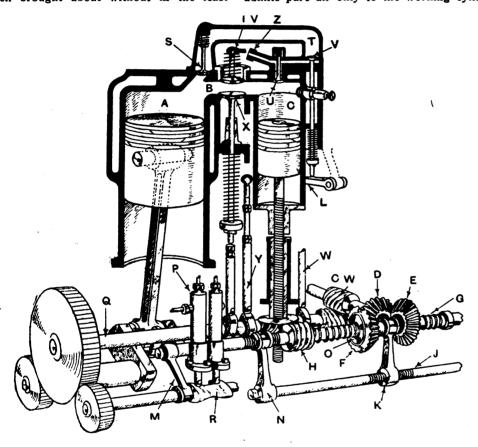

IGNITION AT CONSTANT PRESSURE

Ingenious Application of the Method in a Foreign Motor—An Unusual Feature in the Construction.

Internal combustion motors of the type commonly employed in automobiles are ordinarily constructed on the principle of ignition at constant volume, or in other words, are designed to fire the working charge when the piston is stationary after the end of the compression stroke and on the point of commencing its descent on the working stroke. Many variations of this plan have been brought about without in the least

bustion chamber after compression has taken place, an unusual amount of complication is requisite. In this respect the motor appears to be less practical than the common type. In view of the fact that it is claimed to develop its maximum efficiency at anywhere from half and three-quarters to full load, instead of at full load only, its design is worthy of close study.

In the accompanying illustration, which is an ideal representation of the machine in question, the various organs are shown in half-section regardless of whether they lie in the same plane or not. From this it will appear that the main inlet valve, IV., which is operated mechanically from the lifter, W, by means of a long rocker arm, not shown, admits pure air only to the working cylin-

altering the cycle of operations, while in a few cases, attempts have been made at introducing other cycles in which ignition is supposed to take place at constant pressure. A novel application of the second method is found in the Roche motor, a recent foreign invention, which has been unearthed by the Autocar.

In this machine, which possesses the unusual feature of a combustion chamber which is entirely separate from the working cylinder and connected to it by means of an open port, governing is performed by varying the volume of the combustion chamber in question, this, in turn, being effected by moving a piston up or down in a small auxiliary cylinder which serves this purpose. As a result of this method of governing, as well as on account of the forcible injection of the fuel into the com-

der, A. Following the suction stroke, this charge of pure air is compressed, forming a high pressure in the auxiliary combustion chamber, C, and the transfer port, B, joining it with the working cylinder. A small volume of air also is compressed in the tubular chamber, T, above, through the poppet valve, S. During the latter part of the compression stroke, the pumps, P, driven by the cams, R, force small quantities of fuel and water through the nozzle, Z, into the small chamber over the combustion chamber, C, adjoining T. The pumps are designed to give a variable lift, and their action is governed by the fork, M, controlling the position of the cams, R. The object of injecting the small quantity of water is to guard against pre-ignition.

At the instant of commencing the working stroke, the mechanically operated inlet

valve, V, is raised by the rocker arm, L, permitting the air which has been compressed in the chamber, T, to enter the smaller chamber below whence its contents of mingled fuel and water is at once discharged through the automatic valve, U, to the combustion chamber, ignition immediately taking place. The immediate rise in pressure at once forces more air into the small chamber, T, so that an injector effect is secured, which serves to force all the fuel into the combustion chamber during the early part of the working stroke. The greater part of the action of combustion takes place in the chamber, C, so that the air present above the working piston and in the transfer port is used only as a medium of expansion and to cool the gas, thereby rendering the motor cooler in operation than otherwise would be the case.

The method of governing the size of the combustion chamber is as ingenious as that of accomplishing the cycle itself. The cam shaft, O, drives through worm gears, a transverse shaft which is geared to the commutator, the double distributor for water and fuel, and also a lubricating pump. The bevel pinion, D, at its other end, drives the equal and opposite bevels, E and F, which are mounted loosely over the shaft. G. The worm, H, which is mounted on this shaft, meshes with a gear which is fixed relatively, but runs on a thread cut in the rod of the auxiliary piston, traveling in the cylinder, C, so that any motion of the worm, H, serves to vary the volume of the combustion chamber. By means of suitable clutches the bevels, E or F, may be connected temporarily with the shaft, G, and the desired movement of the auxiliary piston effected in either direction. Two small cone clutches, O, actuated by the fork, K, against the pressure of suitable springs, are employed to connect the bevels to the shaft, G, as required. To throw either one into connection, the small shaft, J is rotated through the usual lever mounted on the steering column, this motion serving to shift the fork, K, along it and engage the proper clutch. This causes the shaft, G, and the gear, H, to revolve, moving the auxiliary piston. At the same time the rotation of the shaft, G, causes the second fork, N, on the rod, J, to draw the rod far enough in the opposite direction to release the clutch from engagement, thus making the movement of the auxiliary piston directly proportional to the movement of the hand lever at all times.

The novelty of the cycle here introduced will be observed to be two-fold. First, only pure air is compressed, the combustible gas afterward being introduced into the combustion chamber and fired at relatively constant pressure. Second, the compression is varied to suit the demand for power, increasing as the quantity of fuel diminishes in proportion to the volume of pure air. In this way, combustion is made complete at every cycle, and the efficiency is maintained at a high point throughout a considerable portion of its range.

DEALERS WERE ALL EASY MARKS

And Willieboy Had Numberless Joy Rides

—Those Who Got Stung Let Him

Sting Others.

There is a certain young man in Cleveland whose name, although it is known, shall be mentionless—who is laying up great stores of trouble for himself. Already a number of local dealers are hot upon his trail and when the storm breaks—woe be unto him!

This smooth young man, with his glib tongue and apparently earnest manner, has had a number of dealers "standing upon their heads" for a week or so, to employ a slang phrase. In turn he has neatly "stung" every one of them, and they have passed him along, each hoping to see the next dealer fall into the trap.

The young man began operations three weeks ago and since then has placed "orders" for a half dozen cars, although in each case, it is not strange to relate, the cars was never delivered. His plan of procedure was cunning and crafty. His father lived in the West, so he said, and he disired to purchase a high powered car—a good one, mind you, a high class, well made machine, capable of putting speed records to shame. Also, a friend of his was coming to town in a week or so, and his friend would purchase the same kind of car.

With all this in mind, and forgetful of ride grafters. how the misguided agents did work to land that double sale! Night after night such and such an agent would take the earnest young man for long rides, with the thought of two big commissions constantly in mind. Night after night the young man's evenings were spent in a riotous round of demonstrations, theatre box parties with dinner and wine afterward, so it is said to be truthfully recorded on the expense books. The young man was having an ideal time.

One unused to such lavish entertainment and, say, a bit unscrupulous, can hardly blame the young man, and so he went from one dealer to another. In numerous cases he "placed his order," but found that "papa was out of town"—referring to the mythical western city—and couldn't be reached by wire. The agents paid the freight on the telegrams and waited for papa to return and send the check on to Willieboy to hand over to the lucky agent.

For nearly two weeks this has kept up and the only reason that Willieboy has not been arrested is due to the fact that every agent that has been "stung" realizes it, and knows that he would be the butt of ridicule from his fellow dealers if the secret got out, so he has kept quiet about it and waited returns from the other dealers.

Maybe Cleveland dealers are "easy graft" and maybe they are not, but it is stated that

by actual count, the quiet Willieboy youth has successfully "worked" seven dealers, each of whom has been in business long enough to have his eye teeth cut. After many demonstrations and theatre parties one agent, bolder than the rest, began a quiet little investigation, and determined to hunt up the young man's father. That's how the secret became known. Strange to say, the respected parent did not live in the western city, but right in Cleveland. He was quick to disavow any hope of having any car in the family, and said his son was "only having a little fun," which amusement, however, he did not evince any desire to pay for.

At present the dealers who have been "stung" and have been "put wise' by the charitable and investigating tradesman, say they will not prosecute the young man, but woe betide him if he happens to "repeat" in a moment of recklessness of absentmindedness, upon some dealer who "is on."

Automobile Thief Ran Into Trouble.

California, which runs Indiana a close race in the discovery of prodigies, has a new one. He is a self-confessed thirteenyear-old automobile thief and was turned over to the police after being captured in the Osen & Hunter garage in San Jose. Clifton Croyer took a car belonging to Dr. N. H. Chamberlain and drove it from Oakland to San Jose, stopping at the garage for water. He could give no satisfactory answer to several questions and the garage men notified the police who, just a few minutes before, had received notification of the theft, by the Oakland officials. Young Croyer, who said he was a member of the Young Men's Christian Association at Stockton, would not say why he took the car, but said that he intended abandoning it and returning home to his mother in Stockton.

Relay Flight with Stolen Automobiles.

Two prosperous looking men coolly entered the \$5,000 car of William G. Costin and drove away, while the latter and some friends were enjoying a play at a Pittsburg theatre one night last week. As a general rule beggars are not choosers, but this pair was exceptional. The purloined car, being stalled in the mud at Glenshaw, they resolved to look around for another relay. Entering the tool house of the American Natural Gas Co. they steered the \$2,000 car of George Weittner out to the road and hurried off. Both cars were discovered, abandoned, the next morning, but no trace has been found of the thieves.

Saratoga Organizes an Automobile Club.

Although one of the centers of horse racing during the summer, Saratoga, N. Y. will have an automobile club, the Saratoga Automobile Club having been organized last Saturday with thirty members. Clarence B. Kilmer was elected president and Edward B. Ashton, vice-president.

AUTOMOBILES PREFERRED TO GEMS

So They are Blamed for Failures in the Jewelry Trade—How an Alleged Victim Explains It.

Nowadays it is the fashion to blame the automobile for failures in many branches of mercantile pursuits. Particularly is this so in the cases of failures in the jewelry trade. Whether or not the growing supremacy of the automobile as a means to social preferment and as a fashionable medium of diversion, has anything to do with the gradual depression in the jewelry trade matters not; sufficient is it that this cause is ascribed as the reason for many failures. The most recent example is that of a big Chicago jewelry corporation that failed recently, with liabilities amounting to about \$100,000.

Albert W. Adcock, one of the officers of the company, in reciting the cause of the failure attributed it mainly to the popularity of the automobile. He said that society people of reputed wealth are not only failing to buy expensive jewelry as they did before the automoble came into such vogue.

"I attribute our failure mainly to the great craze that has recently taken possession of society people," said Adcock. "The purchase and maintenance of a first class automobile involves no little expense and I know ā big lot of people whose names would be recognized as standing high on the social roll of Chicago who have made, and are making, all sorts of sacrifices, in order that they may keep a first class garage, a good chauffeur and may give notable automobiling parties.

"This being the case, they are not buying the same class of jewels and silver that they formerly did. They find that the expenses of the automobile establishment are such that they are compelled to give presents which, while they look about as good, are of lighter weight and less expensive quality than those they have heretofore given.

"When tires cost \$60 to \$90 apiece, people are apt to get along with lightweight silver. It looks very well and at a dinner no one is going to try how easily it will bend, nor examine it for the maker's name."

Jury Determines Value of Human Legs.

Although it might puzzle some juries it did not take a Norristown (Pa.) jury many minutes to decide how much it is worth to cause the breakage of two legs—one natural and one artificial, when it ordered John R. Wood, an iron manufacturer of Conshohocken, to pay \$300 damages to John Rigler, also of that city, as the result of a suit brought by Rigler to recover for being thrown off a horse. Wood was held responsible for not stopping his automobile on the road in Plymouth township when the horse and its rider approached.

The Week's Patents.

877,970. Pneumatic Tire. Otto Uhlmann, Taunton, Mass. Filed Feb. 16, 1907. Serial No. 357,602.

1. A vehicle wheel comprising a concaved felly, a pneumatic inner tube resting in said felly, a convexed tube cover fitting over the outer portion of the inner tube, a removable annular plate at each side the felly extending partially over the tube cover, an outer casing extending over the tube cover, and upper portion of said annular plates and provided with a heel piece at each lower edge, a removable annular plate at each side the felly outside said annular plate and provided with a hook shaped flagge at its provided with a hook shaped flange at its upper edge to grasp said heel piece, and means for maintaining the parts in assembled position.

878,005. Automobile Driving Gear. John E. Johnson, Leaf Mountain township, Ottertail county, Minn. Filed Feb. 16, 1907. Serial No. 357,657.

1. In an automobile, the combination with a supporting frame, of a front and rear axle, each divided in the middle, supporting wheels fixed on the outer ends of the axle section and bevel gears at the inner ends thereof, hubs journaled upon the abutting ends of the axle sections and provided with radial arms, compensating gears journaled at the ends of said arms and meshing with the bevel gears, a ring shaped sprocket wheel trunnioned on the ends of the journals of the compensating gears, and an endless chain belt engaging said sprocket wheels and thereby turn the rear and front shaft simultaneously, said front sprocket wheel having a ring held to it by two diametrically opposite trunnions, and the ring having at ninety degrees from said trunnions internal trunnions at the ends of the journals of the compensating gears, means for imparting rotary motion to said sprocket wheels, means for guiding the front sprocket wheel, and means for steering the front wheels by swinging the entire front axle in a horizontal plane.

878,015. Tubular Metallic Spring Tire. James K. Parker, Longbeach, Cal. Dec. 12, 1906. Serial No. 647,554.

1. A vehicle wheel tire comprising a rim body, a sectional tubular elastic metal tire secured thereon, and springs within the sections and bearing outwardly thereon, said springs extending between the rim body and the metallic tire sections.

878,072. Transmission Gear for Automobiles. John W. Lambert, Anderson, Ind., assignor to The Buckeye Manufacturing Company, Anderson, Ind., a Corporation of Indiana. Filed Jan. 26, 1907. Serial No. 354,178.

1. A driving mechanism comprising driving friction disc, a driven friction disc, a shaft carrying the driven friction disc, means for mounting said shaft to permit it to have a backward and forward movement. a beveled gear carried by said shaft, a longitudinal shaft carried by said longitudinal shaft meshing with the gear on the shaft of the driven disc, a rear axle, gears connecting the rear end of the longitudinal shaft with the rear axle, and means where-

878,073. Lubricant Distributor for Engines. Vincenzo Lancia, Turin, Italy, assignor to Lancia & Co., Turin, Italy. Filed May 13, 1907. Serial No. 373,486.

1. An engine lubricant distributor comprising a cylindrical casing closed at its ends a rotatable cylinder provided with two chambers communicating respectively with the ends of the casing, suction and discharge branches on the casing communicating with corresponding openings in the said chambers, a third chamber in said cylinder communicating at its ends with the two chambers, a displacer piston in said third chamber and means within the casing for reciprocating the piston in the cylinder, substantially as described.

878,074. Motor Vehicle. Josef Latzel, London, England. Filed June 10, 1907. Serial No. 378,242.

1. In combination, a driven gear member, an undivided stationary supporting axle member road wheels supported thereon and a continuous undivided rotating axle member connected to the driven gear member and to the road wheels, substantially as set forth.

878,075. Pneumatic Tire. Henry D. B. Lefferts and Eliphalet De Camp, Orange, N. J. Filed Jan. 15, 1907. Serial No. 352,440.

1. A pneumatic tire comprising an outer casing, a normally inflated main inner tube having a valve stem, and a normally deflated divided supplemental reserve tube arranged without the main inner tube and having terminal soft cap portions disposed in opposite relation to the valve stem, said soft cap portions being adapted to be inflated about said valve stem for the main inner tube.

878,077. Cushioning Device for Automatic Dilution Valves in Carburetters. Adele A. Longuemare, Paris, France. Filed Jan. 10. 1907. Serial No. 352,359.

1. In a device of the character described the combination with a member movable by variations of pressure, of a closed cylinder, a hollow piston in said cylinder and provided in each face with a plurality of holes, and an operative connection between said piston and said member.

878,081. Vehicle Spring. Charles A. Meredith, St. Louis, Mo. Filed Sept. 3, 1907. Serial No. 391,245.

1. A spring of the class described comprising an upper section; a lower section; supports connected with the lower section; a sleeve mounted upon the axle of the vehicle and pivotally connected to the supports; an auxiliary spring carried by the supports to provide a more even and equal movement to the vehicle springs, substantially as specified.

878,156. Automobile Running Gear. Charles T. Pratt, Frankfort, N. Y. Filed April 10, 1907. Serial No. 367,308.

1. The combination in an automobile running gear of the frame and axle and pair of steerable ground wheels carrying one end of the frame, and pair of independent levers intermediately pivoted to the frame, an axle and pair of ground wheels carrying the rear ends of said levers and an axle and steerable pair of ground wheels carrying the forward ends of said levers and connected therewith by a suspending shackle all arranged to carry the other end of a frame, substantially as set forth.

878,176. Spark Timer. Darwin Almy,

Providence, R. I. Filed May 16, 1906. Serial No. 317.247.

1. In a spark timer, the combination with a shaft, of a cam in the form of a collar having the roll rotatably secured in a recess in the collar by a screw pin in a position for the roll to extend beyond the periphery of the collar and adjustably secured to the shaft by a set bolt, a screw threaded trunnion supporting the shaft, a metal frame having the internally screw thread hub, the flat face, a plurality of lugs formed integral with the frame on the face, an insulating block secured to each lug and interfitting therewith, a binding post secured to the frame, a plurality of switches each switch consisting of a flat spring having a contact point adjacent its free end and rigidly secured at its opposite end to a lug in a position for the roll on the cam to engage the spring, a flat spring rigidly secured at one end to the adjoining insulating block by a screw and the nuts, and a screw post having the contact point adjustably secured to the free end of the spring by a split block and a nut in a position for the contact point to engage with the contact point, and a plurality of stops consisting of a screw covered with an insulating material and secured to the frame on the face in a position for the free end of the spring to engage with the stop and hold the contact points in their open position, whereby a direct electrical connection is made with the springs and a reciprocating sliding contact is given to the contact points on the springs, as described.

878,297. Carburetter. Leon M. J. C. Levavasseur, Puteaux, France. Filed May 16, 1907. Serial No. 373,922.

In a carburetter, the combination, with the admission chamber for the air having a lateral branch, and a valve in the lower part of said chamber which is opened by the suction of the engine, of a hydrocarbon container mounted on said chamber at its upper part and having a capillary passage directly above and in alignment with said valve, and means for supplying the hydrocarbon to said container.

878,364. Explosion Engine. Charles L. Edwards, Vernon, N. Y. Filed March 8, 1907. Serial No. 361,214.

1. In an explosion engine, the combination with a cylinder provided with a water jacket, and having in the end thereof an opening in which are formed an inner conical and an outer cylindrical valve seat, and having an inlet port and an exhaust port communicating with the opening, of an exhaust valve normally resting on the conical seat and closing the opening, said valve having a stem extending out of the cylinder, said cylinder being provided with a valve stem guide provided on its inner end with a petticoat, an inlet valve having a plurality of openings therethrough, normally closed by the petticoat, said valve moving in the cylindrical seat, and having a stem encircling the exhaust valve stem, said valve having a peripheral flange adapted to close the exhaust port, when moved away from the petticoat, concentric springs resting at their inner ends against the cylinder, and encircling the valve stems, the outer spring being of greater strength than the inner spring, a collar on each of the stems for engaging the outer ends of said springs, the collar on the exhaust valve stem being of greater diameter and engaging the stronger spring, said collars being spaced apart whereby the continued movement of the exhaust valve stem after the opening of the exhaust port will move the inlet valve to close the exhaust port and to open the inlet port, a drive shaft, a piston in the cylinder and connected therewith, and a connection between the drive shaft and the valve stem for operating the same at regular intervals.

"Supplies the Missing Link"

New York, March 16, 1908.

Bicycling World Co.:

Gentlemen: I received your book "Care and Repair of Motorcycles," and after reading it carefully I must say that it supplies the missing link. It is a book which should be in possession of not only the trade, but of every owner of a motorcycle.

I congratulate you on the issue and have every reason to believe that it will facilitate the motorcycle business.

C. KAUFMAN, Mgr. The Motor Equipment Co.

Triumph Grease, What Is It?

It is the newest production of auto grease, and benefitting by the experience of other makers, we have produced the best one yet. [We do not imitate any one, nor follow any other maker's plans. Our grease is spongy when made—it is spongy all the time, but it does not melt or run out. [It never gets hard or stiff so that it will not do its work properly—no matter how cold the weather is. It is made of the purest and best lubricants to be found, and compounded in such a manner as to produce what the auto user has long wanted. [A grease that will lubricate from start to finish, and will last long enough to pay for the trouble of putting it in the machine, and then staying right there like a good clerk attending to its own business constantly, and does not need punching up and renewing every few days, and leaves the machine clean and not all grease when through using it. [It is the red thorn in the side of the old fogy grease, or the non-fluid oil makers. It is always RED. No other grease like it, and it is not like any other grease. So we are not imitators in any sense of the word. [Buy it, and try it, and if not all we claim for it, any dealer will refund all expense it has been to you.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

FRANKLIN Automobiles

You can't buy easy-riding by the pound—nor carrying-ability either.

The Franklin automobiles are the lightest-weight automobiles of their power. They are as easy-riding as the finest horse-drawn carriage. And they are abler and more durable than if they weighed twice as much.

The 5-passenger Franklin Type D for example, rides so smoothly that no automobile but a Franklin can keep up with it on ordinary roads. It weighs under 2,200 pounds. It carries its load farther in a day than 5-passenger automobiles that weigh seven hundred to a thousand pounds more; and it is doubtful if any of these could stand such a hard-driving test as Type D went through in its 40-hour Chicago to New York run. Its price is \$2,850, yet its efficient air-cooled engine and light weight make it cost less in six months than a heavy automobile of considerably lower price.

The Franklin Type G family touring car costing \$1,850 and weighing only 1,600 pounds, does more work than any other 2,000-pound automobile and costs less to run.

The six-cylinder 7-passenger Type H at \$4,000 is completely free from vibration or jolting. And it is the ablest high-power touring car ever built; yet it weighs 500 pounds less than the average 5-passenger 4-cylinder automobile, and is more economical to maintain.

Every Franklin automobile has four full-elliptic springs. These have a "movement" of 57/8 to 6½ inches as compared with only about 2 inches in the ordinary half-spring—before the frame bumps on something. And the Franklin wood-frame is laminated (built up in layers) so that it is stronger than a pressed steel frame, and absorbs shocks and vibrations as steel will not do.

A ride in a Franklin automobile will probably give you an entirely new standard of comfort as well as ability.

WHY SIX CYLINDERS?

THE NEWEST GREAT ARROW SIX-CYLINDER CAR is the most luxurious and comfortable car running today, no matter what the country of origin. The feeling while riding in a six-cylinder car, even at a high speed, is exactly like that of coasting down a gentle grade with the clutch thrown out. This is felt not only on a level, but even when climbing a hill. There are four reasons why six cylinders are superior to four.

- 1. ABSENCE OF VIBRATION. This is due to a perfect balance of the engine. In a four-cylinder the propulsion dies down while in a six-cylinder it overlaps.
- 2. SILENCE. The six-cylinder car is more silent than the four, the exhaust, due to the rapid sequence of explosions, being practically continuous. The perfect balance of the engine also contributes to this quietness.
- 3. FLEXIBILITY. Due to a more constant torque obtained by the constant impetus of continuous explosions, giving an ability to run powerfully and smoothly at any speed, from four miles an hour to sixty.
- 4. EASE OF OPERATING. Owing to there being less necessity for changing gears, especially in traffic, as the six-cylinder car can be run much slower than the four when on the high gear.

These four points prove conclusively that the six-cylinder GREAT ARROW is as near the ideal motor car as modern mechanics can bring it.

An automobile is, after all, simply a piece of machinery.

The man who buys an automobile without carefully considering its worth as a piece of machinery, lays up trouble for himself.

The exclusive mechanical merit of the Marmon urges a careful buyer to investigate it thoroughly before purchasing any automobile.

In testing it, he cannot help noticing its external as well as internal beauty, and its distinctive ease of motion—an exclusive feature which commends it to men who appreciate comfort and appeals even more strongly to women.

Note List Above

As It Was In The Beginning

Car is now and (I promise) ever shall be an honest Car - honestly designed - conscientiously built truthfully sold and in good faith backed up by its makers after it is in the hands of the buyer.

Times and conditions may change, but principles never do.

Maxwell principles of construction—chief among which are Thermo-syphon cooling; Unit Power Plant with three point suspension; and metal body,—are sound; all have been time-tried and road proven.

Here and there you'll find a maker who has adopted one or more of these Maxwell features, but only in Maxwell Cars do you find a combination of all of them.

I always feel sorry for the maker or sales manager who finds it necessary to contradict year after year all he has said previously, or who must devise new "talking points" to cover up past mistakes. I feel more sorry for the people who are beguiled into buying his cars.

Maxwell advertisements of four years ago expounded the same theories and principles as do those of 1908—and those of next year will be consistent with this. That's only one expression of Maxwell stability-it's one reason why Maxwell owners are such a contented lot.

Our catalog is free.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

A TOURING CAR IN THE TRUE SENSE OF THE TERM

The man who gets the most pleasure from his touring car is not the man who limits his touring to the macadam roads; for the most interesting sections of the country and those of the greatest natural beauty lie, for the most part, beyond the regions of improved highways. For that reason, there is no quality of a motor car more important than the ability to traverse bad roads.

In unique degree, the White possesses the qualities of a "bad roads" car. Owing to the perfect flexibility of the engine, the White tourist can accommodate the speed of his car, yard by yard. to the condition of the road, speeding up on each little stretch of good road, and slowing down for each hole and "thank-ye-ma'am"—without shifting of gears or any manipulation except of the throttle. The tremendous pulling power of the White engine under all conditions means immunity from getting stuck in the mud or sand. Running through deep water, as in fording streams, is easy for a White. And as for climbing grades in mountainous regions—there is no other machine which can approach the White in hill-climbing qualities.

Drive a White Steamer and see the country

WHAT THE MOTORIST GETS WHO SPECIFIES

MORGAN & WRIGHT TIRES

F. H. Croul, of Detroit, got the specifying habit two years ago, with the following result (letter to us under date of January 3d, 1908):

"On May 11, 1906, I purchased a Packard machine and specified your tires. These tires are still in operation on this machine, and outside of a few minor repairs have never been out of service.

"In the same month and year, I specified your tires on a Northern runabout, and have had the same experience with them, and at this writing they are in good order.

"On May 1st, 1907, I specified your tires on a four-cylinder Model C, Cadillac runabout, and at this writing they are in perfect order.

"All three of my machines are in use the entire year, and have been operated a great many miles.

"I am also pleased to inform you that the tires furnished Mrs. Ellen P. Croul on a large Welch machine are giving most excellent service, and she is much pleased with them."

You can have the same kind of service by using the same kind of tires.

GET THE SPECIFYING HABIT

MORGAN & WRIGHT, DETROIT

Branches, Agencies or Dealers Everywhere

One Price for Warner Auto-Meters

TEVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being obved. That was ourselves. But, unforserved. tunately, we sold to the jobber also - and the jobber cut the price.

Then there was fun in the camp. That hurt us - it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out - that hurt the consumer, the dealer and ourselves. For the jobber knows

no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

KELLOM MAKES A STRIKE IN OIL

Encounters a "Gusher" and Gets Facts Concerning "Substitution"—Several Dealers to be Prosecuted.

Due to the fact that Charles F. Kellom, head of the Philadelphia firm which markets Invader oils, recently went on a "prospecting" tour, it is extremely probable that eight of the Quaker City's dealers and garage keepers shortly will appear before the bar in the role of dependants. Not only did he "strike oil," but he discovered a "gusher" with a rich yield of the material he was after.

Convinced that fraudulent substitution was being practiced to an unwholesome extent, Kellom decided to obtain the proof necessary for legal proceedings. Accordingly, accompanied by two witnesses, in an automobile, he made the rounds of 13 garages, at each of which he called for Invader oil. As he was unknown to the garagemen, there never was any hesitation in supplying it, or at any rate what was represented to be Invader oil. At 8 of the 13 places visited the stuff supplied was not only not the genuine article, but it did not even resemble it, of which facts Kellom and his witnesses made due note. At one garage the Kellom party struck up such a cordial acquaintance with the attendant that he was thrown so completely off his guard that he became extremely confidential. He conducted them into the establishment and pointed to a barrel which did not contain Invader oil.

"We can supply Invader, or —, or —, and almost any other brand that may be called for," he vouchsafed, and with a smile added: "It all comes from that same barrel. The people who buy the oil don't know the difference."

The "gusher" was unaware of the identity of his visitors, and of course had no reason of suspecting that they did "know the difference."

The proof having been obtained Kellom & Co. now are preparing suits against the "substituting eight."

Mortgagee Arouses Banker's Wrath.

Albert C. Banker, a Chicago dealer, who has been in the limelight of publicity before, was placed under bonds of \$300 not to carry out his alleged threat to shoot Nicholas E. Ford, of Evanston, Ill. Ford claims to have a mortgage on some machines in Banker's possession, and sent a bailiff to Banker's place, 1424 Michigan avenue on March 30 to serve a writ of attachment. Later, when Ford called in person Banker refused to leave and made the alleged threat. The matter came up in court again on April 1, and Banker was discharged. The revolver found in his pocket was one that could not be fired.

Taxicab Sued for Selden Infringement.

The Association of Licensed Automobile Manufacturers has brought suit against the New York Taxicab Co., the New York Motor Cab Co. and Walter C. and Harry N. Allen, officers of those companies, for alleged infringement of the Selden patent.

As usual, the proceedings, which were brought in the United States Circuit Court for the Southern District of New York, were instituted in the name of the Electric Vehicle Co.

Grabowsky Organizes a New Company.

Having severed connection with the Rapid Motor Vehicle Co., Pontiac. Mich., of which he was one of the founders, Max Grabowsky has organized the Grabowsky Motor Car Co., in Detroit. Commercial vehicles, buses and sight-seeing cars, to which he long has devoted his attention, will constitute the product of the new enterprise.

Perrett to Manage New Detroit Branch.

W. M. Perrett, former manager of the Diamond Rubber Co.'s Detroit branch, will not long remain out of business. He has engaged to become manager of the Empire Automobile Tire Co.'s depot which will be established in Detroit on May 1st.

MUST KEEP OFF OF "TAXICAB"

New York Company Claims Word is a Trademark Which Must be Respected —General Warning Issued.

According to Ellis Lord, of the firm of Alexander & Colby, attorneys for the New York Taxicab Co., each and every member of the army of promoters that seized on the word "taxicab," "taxacab" or anything else that resembles the word, must needs "guess again," that is to say, find another name for their respective taximeter cab companies. For the New York Taxicab Co., claiming to have coined the word, have laid legal claim to it as a trade mark or trade name and Alexander & Colby have been engaged to enforce the claim.

Mr. Lord states that two companies already have changed their titles because of the New York company's attitude and that preparations are now being made to force the fight all along the line. To that end, a sweeping general notice will be issued early next week warning all persons and corporations against the use in any manner, shape or form of the word "taxicab" in respect to motor cabs or vehicles of any other kind. As the New York Taxicab Co.'s chief competitor styles its vehicles "taxacabs," Mr. Lord was asked whether his clients claimed that form of spelling the word was an infringement of their rights. He promptly responded in the affirmative. The general warning that will be issued, summarizes the Taxicab Co.'s claim as follows:

"That the word 'taxicab' has been duly adopted by the New York Taxi-Cab Co. as its trade mark; that said trade mark is a new coined, arbitrary word, invented on or about May 9th, 1907, in behalf of said company and continuously used by said company since said 9th day of May, 1907, the date of its certificate of incorporation, which was duly filed in the office of the Secretary of State on May 10th, 1907; that

statutes.'

said company on or about October 11th. 1907, filed its application for the registration of its said trade mark 'taxicab' in the United States Patent Office, pursuant to the statutes of the United States in such cases provided; that said application was marked in the Patent Office with the serial number 30.547; that the same was thereafter passed by the Patent Office for publication and published in the Official Gazette of December 17th. 1907, and was duly allowed on January 20th, 1908; that thereafter and on or about February 18th. 1908, the said Patent Office duly issued to New York Taxicab Co. a certificate of registration, number 67,700, whereby the word 'taxicab' was duly registered in the Patent Office as the trade mark of said

Standard Welding in Its New Factory.

company, as provided by the United States

The Standard Welding Co. has taken possession of its new plant at W. Seventy-sixth street and the Lake Shore tracks, in Cleveland. The new plant is of brick and steel construction with the "slow burning" type of floors. The main building is 450 feet long by 50 feet wide and three stories high, and the saw tooth structure attached is 75 feet wide by 450 feet long, with basement, giving 100,000 square feet of floor space. The power house is equipped with 1,500 horsepower boilers and engines. There are pumps, air compressors, etc., and the latest style of automatic stokers, coal and ash handling systems, etc.

Penney Gets Out of the Imperial.

Comus B. Penney, of Buffalo, N. Y., has turned over to the Buick Motor Co., of Flint, Mich., his entire interest in the Imperial Motor Co., at 1094 Main street, which will become an exclusive agency for Buick cars. The change resulted from the desire of the Buick people to turn the Imperial Motor Co. into such an agency and Mr. Penney's disinclination. Finally, he offered to buy the other interests or sell his own, and the latter proposition was accepted. Penney has been prominent in the trade in Buffalo for the past three years.

Continental Caoutchouc Moves Uptown.

The Continental Caoutchouc Co. have made a long jump—from 43 Warren street to 1788-90 Broadway, which is at the corner of Fifty-eighth street, New York City, where their general offices and sales room new are located. The new location is in the heart of the up-town automobile district and affords ample "elbow room."

Mooers Takes Leave of the Moon.

L. P. Mooers, of the engineering staff of the Moon Motor Car Co., St. Louis, has severed connection with that concern. He already has matured the design of a popular priced car and it is not improbable that a new company will be formed for its manufacture.

THE MOTOR WORLD

The Week's Incorporations.

Rockland, Ill.—Joslyn Automobile Co., under Illinois laws, with \$5,000 capital. Corporators not named.

Chicago, Ill.—Chicago Auto Livery Co., under Illinois laws, with \$1,000 capital. Corporators—P. G. Bell, R. M. Cutting, E. F. Kemper.

Chicago, Ill.—Webb Jay Motor Co., under Maine laws, with \$500,000 capital. Corporators—J. E. Manter, president; C. E. Eaton, treasurer, Portland Me.

Norristown, Pa.—Wildman Motor Car Co., under Pennsylvania laws, with \$25,000 capital. Corporators—Horace C. Coleman, Elihu R. Roberts and Frank B. Wildman.

Camden, N. J.—Standard Automobile Co., The, under New Jersey laws, with \$100,-000 capital. Corporators—Richard H. Stamper, Reuben Miller, David H. Goff.

Los Angeles, Cal.—Taxicab Co., under California laws, with \$100,000 capital. Corporators—Don E. Murphy, Walter J. Wren, Frank Spar, James Slocum and Donald Barber.

Detroit, Mich.—Rae Electric Co., under Michigan laws, with \$50,000 capital, to manufacture automobiles. Corporators—F. B. Rae, J. J. Gillette, J. H. Livsey, William Lucking.

Wichita, Kan.—Wilson Automobile Co., The, under Kansas laws, with \$25,000 capital. Corporators—Henry A. Wilson, W. S. Fowler, Thornton Sargent and J. M. Fowler.

New York City. N. Y.—Auto-Security Equipment Co., under New York laws, with \$27,000 capital. Corporators—Woolsey A. Shepard, William P. Hammond and Theodore M. Hill, 111 Broadway, New York City, N. Y.

Rochester, N. Y.—Horton Boat, Engine and Supply Co., under New York laws, with \$75,000 capital, to manufacture boats, engines. automobiles, etc. Corporators—L. La V Horton, C. D. Larabee, M. A. Brush, Rochester, N. Y.

New York City, N. Y.—Braunwarth-Wallace Co., under New York laws, with \$2,000 capital, to deal in automobile parts. Corporators—Otto Braunwarth, Francis J. Wallace and William J. Masters, 1900 Broadway, New York City, N. Y.

In the Retail World.

Claude S. Cameron and H. Duras will open a garage and repair shop in the Dodd building on West Main street, Milwaukee, Wis., about April 15.

W. B. Jernigan, of Pine Barren, Fla., will open a garage and sales room at Pensacola. He will handle the Franklin line exclusively.

Joe Downey has secured the garage at Magnolia, Mass., and will keep on hand half a dozen cars for summer visitors to that resort.

J. M. Padgett is to open a wholesale

house in Topeka, Kan., for the handling of tires and other supplies. It will be located at 118 East Seventh street.

George H. Kimball and George H. Emerson have become partners in a new automobile brokerage firm in Boston. They are located in the Motor Mart.

Farmington, Iowa, now has a fully equipped garage, owned by Kelley & Co., and managed by Charles Cleave. A repair shop is included in its conveniences.

H. W. Dimmitt is fitting up a garage at Wymore, Neb., where he will conduct a transfer and livery business. A repair shop will be operated in connection with the business.

The Mason City Auto and Supply Co., Mason, City, Iowa, of which W. O. Campbell of Waterloo is owner, has opened a new garage on South Main street. F. B. Bryant will be the manager.

The Brown Brokerage Co., Coffeeville, Kan., have taken possession of a splendid new modern sales room and garage. It is concrete and brick, 60x175 feet. The Franklin will be made one of its features.

F. R. Pendleton has removed the Cartercar agency in Boston to the quarters in the Motor Mart vacated by the Corbin company. The local company has reincorporated under the name of the Cartercar Co. of Boston.

The North End Auto Co. has opened a garage at 19 East Buena Vista street, Colorado Springs, Colo., to be devoted exclusively to electric vehicles. A. R. Flagler, an expert electrician, is manager. Complete charging and repair apparatus has been installed

George Brewer and George Wilcox, Jr., of Athol, Mass., are reported to plan altering the old Brewer toy factory in that town to make it a first class automobile station. The upper story will be fitted up as a repair shop, the lower floor being used for storage of cars.

The Broadway Auto Co., of Detroit, Mich., is completing a large garage at Mott avenue, near Woodward. The building is fireproof and is in two sections, one being for gasolene cars and the other for electrics. The capacity will be for 50 of the former and 25 of the latter. All the equipment will be of the most improved character. E. D. Hutchinson is the manager.

The affairs of the Boyer Motor Car Co., San Francisco, Ca., who failed several weeks since, are being wound up. This company suffered two fires during last year and was unable to successfully pull through the financial panic. Boyer himself has become identified with the Consolidated Motor Car Co., 402-406 Golden Gate avenue, who have taken on the Franklin line, which Boyer previously handled. They will be exclusive Franklin dealers. The officers of this concern are: S. G. Chapman, president and manager; J. H. Doust, vice-president; Max L. Rosenfield, secretary.

BIG CROWD AT PITTSBURG SHOW

Many Exhibits in Uniform and Artistic Setting—Local Makers Stage Two New Cars—The Exhibitors.

Pittsburg's "show week" is on. It was ushered in Saturday afternoon last, 4th inst., and by evening all but the usual delayed-in-the-freight exhibits were in place, the decorations set in order and everything ready for what was called a record crowd for Duquesne Garden, and estimated to number 10.000 souls.

The scheme of employing only uniform decorations, and of eliminating advertising signs and also noise-making devices in general has been applied with particularly good effect. The "official" colors are red and white, and with a touch of gilding here and there, they have been disposed throughout the building in bunting, papier mache statuary and ornaments. By way of variety, 24 mural paintings depicting scenes in which the motor car figures with suggestive prominence are placed about the walls in orderly fashion, while the booths themselves are touched off with floral decorations. The foyer entrance to the main hall is guarded by a huge eagle with outstretched, gilded wings, which looks toward the far end where the musicians' stand is presided over by the familiar "Motor Girl," larger than life and bearing aloft the illuminated, winged wheel of pet symbolism.

The exhibits number the usual assortment of cars, accessories and also an adjunctive display of motor boats. In respect to cars of prominence, the industry is well represented, Pittsburg being an enthusiastic and discerning "automobile town." There are more than half a hundred exhibits in all, and of these more than half are exhibits of cars.

Two entirely new cars of local manufacture are shown for the first time. One is the Belden, made by the Belden Motor Car Co., which is a six-cylinder, 40-60 horsepower touring car of entirely new and original design, embodying a number of novel mechanical features. The cylinder dimensions of the motor are 4% by 5 inches, the valves are mounted in the cylinder heads, the mounting is of the three-point order, ignition is by Bosch magneto. The transmission is by sliding change gear affording four forward changes of speed with direct on the third, and shaft drive to the live rear axle. The car weighs 2,800 pounds when equipped with the touring body, and is presented in a variety of other mountings

The Fort Pitt Manufacturing Co., New Kensington, Pa., are showing for the first time the new Pittsburg Six—which is all that its name implies. It is a Krupp steel car, built on foreign lines, after designs by

the "old masters," interpreted by an imported designer. Though generally conforming to the best known lines of current practice, it evinces considerable right to distinction in the rating of its sextuple motor which is catalogued at 54-72 horsepower.

The show will continue until the end of the week. To-day: (Thursday) is Society Day at \$1 a head. Among the exhibitors of cars are the following:

Allegheny Automobile Co., Pierce, Racine, Rapid Truck; American Automobile Co., Pope Hartford, Pope Waverly, Pope Tribune; Arlington Motor Car Co., Jackson, Acme; Banker Brothers Co., Pierce Arrow, Stevens Duryea; Belden Motor Car Co., Belden: Bellefield Motor Car Co., Couple Gear Freight Wheel Truck, De Luxe, Pennsylvania; Bensen, B. F. & Co., Rapid Motor Vehicle Truck, Rainier; Collins, D. P. & Co., Lozier, Moon, Studebaker electric; Colonial Automobile Co., Pope-Toledo, Apperson, Baker electric; Central Automobile Co., Reo, Premier; Diamond Automobile Co., Buick; Fort Pitt Automobile Co., Locomobile, Oldsmobile; Fort Pitt Manufacturing Co., Pittsburg Six; Hiland Automobile Co., Peerless; Iams Motor Car Co., Royal Tourist, Corbin; Imperial Motor Car Co., Cadillac; Keystone Automobile Co., Welch, Stoddard-Dayton, Columbia electric; Liberty Automobile Co., Mitchell, Wayne, Mora; Pittsburg Motor Co., Pittsburg Truck, Babcock Electric; Miller Bros., Model; Standard Automobile Co., Packard, Franklin; Schroeder Automobile Co., Payne-Modern, Cameron; Wilkinsburg Automobile Garage, Elmore; Winton Motor Carriage Co., Winton; The White Co., White steamer.

The accessory exhibits include those of the Acetyvone Co., lamps and generators; Atlantic Refining Co., lubricants; Air-Tight Steel Tank Co., gas tanks; Auto Igniter Co., ignition devices; Automobile Specialty Co., wind shields; Barcus, J. C., Farina, Ill., accessories; Bowser, S. F., Co., gasolene storage systems; Banker Bros. Co., wind shields; Doubleday-Hill Electric Co., electric supplies; Diamond Cycle Co., Indian motorcycles; Diamond Tire Co., tires; Echo Horn Co., horns; Firestone Tire Co., tires; Fisk Rubber Co., tires; Gabriel Manufacturing Co., horns; Goodrich, B. F., Co., tires; Goodyear Rubber Tire Co., tires; Gibney, James L. & Co., Continental tires: Hartford Suspension Co., shock absorbers.

Makers to Support Three Contests.

Nine members were present at the regular monthly meeting of the executive committee of the National Association of Automobile Manufacturers in New York yesterday. Their only transaction that did not smack of purely routine business was a resolution to support three competitive events during the year—an open road race, a stock car race, and a touring contest, which is generally interpreted to mean the Vanderbilt cup race, the Briarcliff race and the Glidden cup contest.

SURPLUS STOCK SYNDICATE STARTS

New Bargain House Venture with Familiar Features—How the "Surplus Stock"

Compares with Announcements.

The automobile carnival brought more than flags and bunting, more than a king, a queen and their suites to New York. Among other things, it brought the Automobile Surplus Stock Syndicate "of New York, Buffalo and Chicago."

Not only the high sounding name, but the cymbalic manner in which the syndicate advertised its wares was so full of suggestion that it induced an investigation which, however, failed in its purpose of disclosing the identity of "13 manufacturers of supplies" who had sold their "surplus stock" to the A. S. S. S. as the advertisement proclaimed.

The "New York branch," which located itself on upper Broadway, is not in a pretentious place for a concern with such a sweeping title. The frontage is about 20 feet and the depth of the store about 50. In it is contained a miscellaneous assortment of automobile accessories, the appearance of which seemed to indicate that they had once been in the possession of other persons before coming into the "Syndicate's" hands. In fact one of the two attendants who appeared to control the destinies of the "branch," asserted that the stock of old accessories of a well known Buffalo automobile manufacturer had been purchased outright. To the stock obtained frim this source had been added a few bushel baskets full of odds and ends, a few tires, and a half dozen bicycles from which the name plates had been removed, though the screws which had held them in place had been returned to their respective holes.

Though the advertisement stated in detail ten different specified articles to be sold at greatly reduced prices and mentioned "fifty other articles too numerous to mention," the store did not look large enough to contain fifty articles of any considerable size.

The firm's business card bears the legend "automobiles and supplies bought for cash or sold on commission."—a statement which may account for the presence of two automobiles which were in the show room that at first sight were thought to be designed for the antique section of the carnival parade until it was stated that they were for sale.

While the Motor World man was in the "syndicate's" branch a piece of mail addressed to "Mr. Preyer" was delivered by a postman. A man of that name was once connected with the Manhattan Storage Co., and other similar establishments, but according to current reports, not the storage company, but one of their kind, comprises the "surplus syndicate."

Three Thousand Miles on High Speed

through heavy snow, slush and mud; drifts in Michigan that blocked railroads and at Cincinnati up the famous Indian Hill of 24 per cent. grade with absolutely no slow speed, intermediate speed or reverse, is the record of the Thomas-Detroit Forty "Snow Bird" which is equipped with

TIMKEN Roller Bearing Front and Rear Axles and Transmission Bearings

The E. R. Thomas Detroit Co. write:

The E. R. Thomas Detroit Co. write:

"This performance is really marvelous, and the first time that any car has ever attempted a feat of this type. Previously, short runs have been made by various cars with the high speed lever locked in, but the idea of driving a car with nothing but high speed gear, across country in the winter time, has been deemed impossible and never attempted before by any manufacturer. It certainly shows abnormal power in the car and very little loss in the transmission of power from the motor to the wheels. It is a compliment to the TIMKEN COMPANY as well as ourselves."

TIMKEN ROLLER BEARINGS

represent the highest point of perfection as yet attained in the finished steel maker's art in addition to a special knowledge of loads and tractive require ments and how to provide for them.

This tells why the makers of over 60 per cent. of all high grade American Automobiles and 95 per cent. of the Trucks made in this country recognize

The Timken Principle Correct and The Timken Quality Supreme

We have important data on loads and haulage of vital interest to everyone who builds or owns a vehicle. Sent gladly on request.

"It is with much pleasure that I enclose my check for renewal of my subscription for the Motor World. Of Motor, Horseless Age, Motor Age, The Automobile, the Automobile Trade Journal, and a Cleveland monthly, I much prefer the Motor World. You have my best wishes."—Robert C. Crowthers Automobile Co., Cincinnati, Ohio.

Passing the Palm to Hower.

When, between blush-provoking compliments heaped on his precious head, his press bureau let it be known that Chairman Hower, of the A. A. A. Touring Board had in the new rules answered every criticism and removed every objection that ever had come of a Glidden touring contest, few suspected the manner in which the modest Hower had made his answer. This did not become apparent until this week, when the revised rules were made public. They make plain that it is not Mr. Glidden's contest, or an A. A. A. contest or even a

touring board's contest. It is a project of, for and by Mr. Hower. The rules are fairly studded with evidence to this effect. But of the entire collection of gems of surpassing authority, none other can even mildly compare with this one.

"The Chairman of the Touring Board reserves the right to alter or amend, suspend, or repeal these rules from time to time, up to and including the end of the tour and final award, as may in his judgment be deemed expedient."

We are not unmindful that wide scope is necessary in contests of the sort, but in a quarter-century's experience with sport, we can recall absolutely nothing that is even remotely fit to be mentioned in the same breath with this definition of the "whole thing." The rule quoted is the limit—not merely the extreme limit by the extremest limit. It entitles Mr. Hower to every leaf in the laurel wreath. It creates a new standard for competition.

During all previous generations it had been supposed that rules were formulated for the guidance of both officials and contestants in order that they might know exactly what they should do and what they should not do, the officials being appointed merely to enforce the rules as laid down and not such rules as they may happen to think should be laid down.

Mr. Hower merits unstinted congratulation for pointing the way to a newer and higher order of things-for showing how to build up a set of rules and then rendering them not worth the paper they are printed on; he merits as much admiration for having the cast iron courage to set himself on a pedestal and pointing to himself as "the whole thing." As the rules are Hower and Hower is the rules, why the expense of printing them was incurred is past understanding. What will happen to the contest if anything happens to Hower, is the one thing that is not made perfectly clear although it must be admitted that what may happen to a contestant who should chance to indulge in "back talk" or who may encounter Mr. Hower if the latter suffers indigestion or stubs his toe, is also a matter for conjecture.

Control of the Motor.

Governing, in the sense of automatically regulating the power output of the motor by keeping its speed down to certain definite limits, though at one time almost universally employed, is now used only by a

comparatively limited number of makers, and is regarded as a useful, though by no means necessary refinement. Governing, in the broader sense of controlling the power output of the motor, either by hand or automatically, remains, even yet, a point open to any amount of discussion.

At present, the average designer recognizes but two basic methods of controlling the motor. One, by means of the spark advance, and the other by means of the throttle. The former, however, is recognized as being unsatisfactory and wasteful if employed by itself, while the latter cannot be used entirely independent of the former.

Of the methods of throttling the gas, there are several in use, the most common being the simple regulation of the area of the intake pipe from the carburettr. Another, which possesses numerous advantages over this, consists in regulating the lift of the intake valves, or else the duration of their opening. Engineers who are inclined to be more or less radical have been struggling for several years with other methods, notably those hinging about the variation of the output in accordance with variations in compression, as well as volume of charge.

Mechanically, this latter idea is most difficult to encompass. The use of movable cylinder heads, variable strokes, variable compression spaces brought about by the use of separate cylinders employed solely for this purpose, and the practice of retarding the closing of the inlet valves until a portion of the mixture has been forced back into the manifold, all have been tried, or at least laid down on paper as being considered more or less feasible. The system employed on the Adams-Farwell motors, in which a portion of the gas is returned to the intake manifold when low powers are required, is perhaps as simple, mechanically as any yet propounded, though applicable only to the peculiar motor formation on which it is used, to all appearances. The principle of the Roche motor, recently described in these pages, offers the opposite extreme in the mechanical sense. Perhaps the theory of the Laval and Jallut motor, which is described elsewhere in this issue is as appealing as any which has yet appeared, though its mechanical drawbacks are numerous and very evi-

In any case, the ideal, is to cause the motor to work at as great or nearly as great

efficiency at low speeds as at high, and with equal certainty and uniformity of action. This, the simple manipulation of either spark or throttle, or both does not and cannot do. It may be argued that the present types of motor are sufficiently flexible for all practical purposes, and that time spent in devising a more perfect method of governing is time wasted-at least so far as the automobile motor is concerned. But it is to be remembered that the solution of the problem of perfectly efficient governing means the elimination of the change speed gear. That in itself is sufficient incentive for a great deal more of time and labor than the problem has ever yet received.

The Chauffeur and His Work.

Clean running gear and bright polished brass work do not necessarily imply that the man in charge of the motor car is possessed of the instincts of the true mechanic. Too often an inspection of a car, the outward appearance of which is all that can be desired, will reveal that, while care has been bestowed on the parts that are visible, the more important, but hidden features have been so neglected as to seriously interfere with the efficiency of the power plant.

The chief interest of the driver who possesses real mechanical instinct, will be centered on the engine and working parts of the vehicle. While it is natural that his main concern should be the efficiency of the power plant, his interest will not stop there; he will not be satisfied merely because "the wheels go round," but will take pains to have them "go round" under the most favorable conditions, and such conditions do not pertain where oil, that has been spilled on the engine base and other parts, is permitted to remain there to catch and retain dust and dirt.

It safely may be assumed that a chauffeur is competent for his work if an inspection of the engine and running mechanism of the car is made at a time when it is entirely unexpected by the man in charge, and the moving parts are found to be as clean, comparatively, as the lamps and visible brass work on the outside. The man who will keep his valves ground, who will take care of the other details of the machinery and will keep the whole of it clean and free from dust or oil will also use care and neatness in packing away his tools and accessories. In a car cared for

by such an individual, the spare inner tubes will not be found knocking around in various places under seats, etc., but will be kept in a place by themselves where oil and tools will not be brought in contact with them. While the owner of a car may find entire satisfaction in the fact that the body finish is unscratched and the brass trimmings shine with the brilliancy to be obtained only by oft repeated rubbing, he will do well to look further and by occasionally raising the hood and inspecting the condition of the outside mechanical parts he may find a way of cutting down maintenance expense by discovering that his driver, while attending to comparatively unimportant details that are visible, is totally neglecting the important and expensive features which are hidden from sight and therefore are being neglected.

The Smoke and the Smell.

Wholly incident to its chief purpose and effect, the New York Carnival parade served as a most convincing demonstration of the need of suppression of the smoke evil. To the observer stationed along the line of march one of the most lasting impressions of the pageant was that of the fumes from the motors. He went home with an oily taste in his mouth and the pungent odor of half-burnt petroleum in his nostrils. Because it was needless as well as disagreeable the offense was all the more deplorable, coming as it did when the cars were, so to speak, on their good behavior.

Oil is never fed to the motor to be burned up or driven out of the exhaust in the form of a murky haze. Its purpose is solely that of a lubricant, and that purpose is overthrown just as soon as actual burning occurs. One of the chief purposes of the cooling system which is a part of every motor equipment is to keep the cylinder temperature sufficiently low so that the vaporization of the oil shall be kept down to a minimum. The properly designed and properly conditioned motor will not smoke unless an excessive supply of lubricant is given it. The fact that the public does not protest at the constant offense of so many cars in this respect probably is due alone to the fact that the gratuitous nature of its existence is not appreciated.

The campaign for rationalization of the use of acetylene headlights in the city has been carried forward until the real of-

COMING EVENTS

April 4-11, Pittsburg, Pa.—Pittsburg Automobile Dealers' Association's annual show in Duquesne Garden.

April 6-11, New York City.—New York Automobile Trade Association's carnival week.

April 11, San Francisco—California Automobile Dealers' Association's hill climb.

April 16-18, Memphis, Tenn.—Automobile show promoted by the Automobile Dealers' Association of Memphis, in the Auditorium.

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 30. Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

fenders are rare exceptions to the rule and openly held among automobilists of the better class to be violating the rules of "good taste." What at one time! threatened to become a just cause for prohibition is thus removed from the field of possible municipal enactment and without unpleasant court proceedure or legal blood-letting. The same sort of spirit which led to this happy result may also be applied to the suppression of the smoke evil, and with equal effect if applied in proper season.

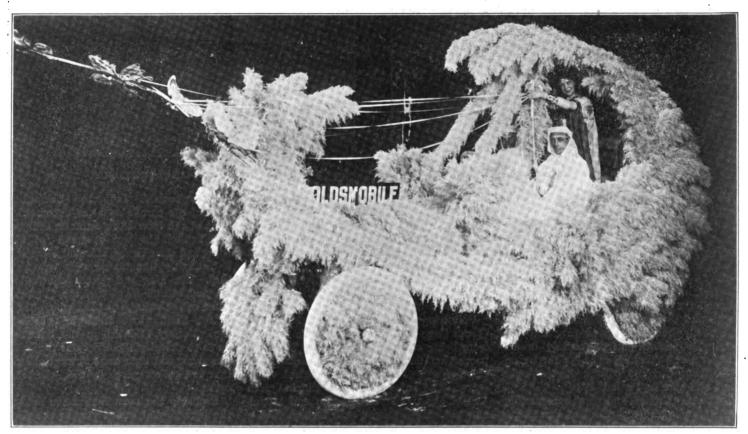

Compared to the glaring headlight the smoke nuisance is almost as serious because it is confined to no limited period of day or night, and because it polutes the city's atmosphere, which at best is never too wholesome. Worse yet, as it is not confined to any one make or style of car, it constitutes an indictment against the whole range of motor driven vehicles.

What next will the automobile organizations give in exchange for practically unlimited speed? There can be small sympathy for certain sections of the new bill introduced at the instigation of the New York State Automobile Association; there should be none at all for that portion of it which would require that the name of the automobilist convicted of whatever offense be "posted" in every county in the State. Not even thieves and nurderers are subjected to such degrading treatment.

AUTOMOBILE HISTORY IN A CARNIVAL PAGEANT

Illustrative Parade the Inaugural Feature in New York's Celebration of a Completed Decade in the Development of the Industry—Many Examples of Early Types in the Long Procession and at Least One Superbly

Decorated Car—Immense Crowds Wait for Hours Along the Route.

GENERAL CUTTING'S SUPERB PRIZE WINNER-ANTHONY AND CLEOPATRA

When any one tells you that the Easter clothes parade on Fifth avenue, the election night celebration, or the New Year's Eve jamboree, according as one feels about it, is "the thing" to coax the New York villagers out on the streets, just make answer with any quotation from Shakespeare that ends with "Go to!" for it isn't so. On Tuesday night of this week occurred the biggest industrial display ever witnessed in New York City. It was the semi-illuminated parade promoted by the New York Automobile Trade Association as the feature of the carnival week. As an industrial display it was the "biggest ever," but as a parade that took all night to pass a given point it was not the most orderly or the best managed ever held. The trouble was that it was just a little too large for the marshals to handle, there being just 738 machines of more than half that number of varieties in the line of run.

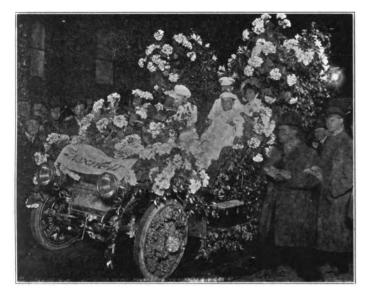

Broadway, that portion of it from Twenty-sixth street to 110th in Harlem, smelled like the Jericho turnpike at half-past nothing at all on the morning of a Vanderbilt cup race. There were touring cars and runabouts, new and old; motorcycles, rubber-

neck wagons, and Fifth avenue buses, to say nothing of more than a hundred commercial vehicles and a few boys on roller skates. And besides all the kerosene cars in Greater New York, including one from Flatbush, there were so many taxicabs that there couldn't have been one left on the side streets or in the garages. No one had time to go and see, but all agree that all the garages must have been untaxicabbed while the parade was in progress.

If one climbed on the window ledges of the Broadway shops, or could get close enough to the curbs, one couldn't see anything on the sidewalks and street but people and automobiles. Several crowd estimaters figured the former at 500,000, but this is a mistake, as only 498,627 people saw the procession. A man who has never had a gown or a lingerie hat built for himself, isn't much of an authority on the fashions, and couldn't say, after reviewing Tuesday night's procession whether this is a green, blue, yellow, cherry, tan or Iemon spring. As a matter of fact, it seemed to be an automobile spring. Most of the girls in the parading cars wore white, and as even the drivers and men folks in the

White steam cars affected this color, it would seem to appear that white is the au fait thing this spring. The lids were, as usual, about as irregular as a raise in salary, but the leaning-tower-of-Pisa-shapeddomes prevailed. It may be remarked in passing that one Sweet Thing in the vicinity of Eighty-seventh street wore ordinary turkey feathers in her head dress. The Sweet Thing couldn't see the cars very well from the sidewalk on account of the horrid people lining the curb, so she climbed up on the pedestal in front of a cigar store where posed a wooden Indian with a bunch of cheroots in one outstretched hand. The Sweet Thing wasn't sure of her footing, so she simply had to put her arm around the waist of the Indian, while her turkey feathers mingled with the plumes in his war bonnet-it was perfectly proper, you know, cause mother was right near-and although horrid people laughed she saw the parade from a good vantage point, if it was a bit embarrassing.

* The parade was to have started at 7.30 from Columbus Circle, but just at that time "Queen Joan" Newton Cunco and "King Leonard" K. Clark, discovered that the for-

"THE QUEEN" AMID THE LILIES

BENJ. BRISCOE'S SECOND-PRIZE WINNER

mer's little boy Antonio was missing. After a long search he was discovered in the coat room playing jacks with "Billy," the bell hop, and as they both were needed in the royal coronation which followed, why, the parade simply had to wait until Antonio could be found. When General John T. Cutting, of the Oldsmobile company, crowned the king and queen with befitting speech and the Queen had taken her place in the lily bedecked Mora car, and the King, who looked perfectly lovely in his crimson robes, mounted his high throne on a Waltham car, the parade started—only about one hour and a half late.

Columbus Circle, and the surrounding side streets where the paraders assembled, or at least made a bluff of assembling, had in the interim become jammed with sight-seers. Some of them got tired of waiting for the procession to commence, but as soon as they left, their places were filled, so there was no vacant standing room for any length of time. The formation was a sight worth seeing even if it was somewhat

confused. All the intersecting streets were kaleidoscopes of color, the white glare from the headlights on the cars being relieved by frequent flare of red light torches held by the watchers. Spiral streaks of color curled out over the heads of the spectators as rolls of paper were let go from second story windows, and confetti showered down upon them.

Following the arrival of the King and Queen there was a long wait while the cars were being steered into line, and when the procession finally moved down Broadway there was a cheer from the patient sightseers. The royal chariot in which Queen Cuneo, her two small children and attendants sat, was arranged as a throne, with a crown-shaped canopy, decorated all over with American beauty roses and Easter lilies. The wheels were concealed by clusters of roses. Immediately following the queen was King Clark-who in every day life is a taxicab superintendent-garbed sumptuously in crimson robes, with heralds, carrying long trumpets, standing on

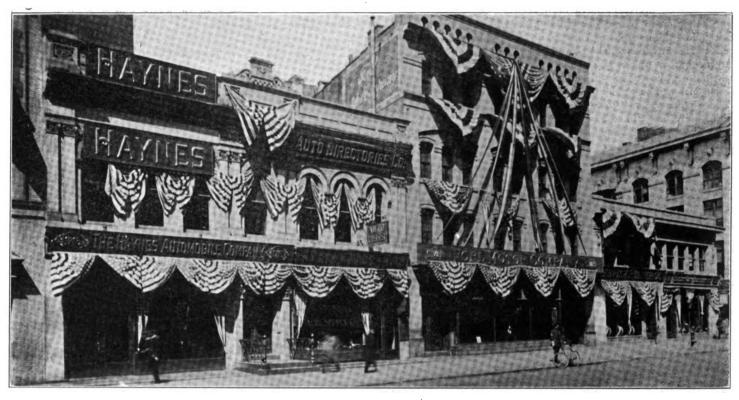

the footboards. Inspector Schmittenberger led the parade in a car decorated with flags of the New York Athletic Club, while just behind him was a squad of bicycle cops, and then Grand Marshal Howell with a brilliantly illuminated sign giving his title. The king and queen followed Howell, and behind them was the Haynes machine of the vintage of 1893, which has been in the Smithsonian Institute at Washington. Barney Oldfield, in the Stearns car he is to drive in the Briarcliff trophy race, was next, and then came several other cars that are to compete in the Westchester event.

Probably the most instructive section of the parade, and which was in the first division, was the exhibit of Haynes and Autocar types for a decade. Each company had ten cars of the corresponding years in line, and they illustrated vividly the progress of automobile manufacture in America in ten years. One bystander was provoked to remark that the "automobile industry is like Topsy—it just growed." Other his-

TWO OF THE GROTESQUELY DECORATED CARS

CARNIVAL DECORATIONS ON "AUTOMOBILE ROW"

toric cars were a White of 1900, which ran from Troy to New York to participate in the carnival; three Panhards of 1898, 1899 and 1900; an 1895 Apperson; a ten year old Buick, a number of curved dash Oldsmobiles; a Welch of 1901; the Mercedes which won the ill-fated Paris-Madrid race in 1903; the De Dietrich which finished first in the Coupe de la Prese; the Pullman which ran from Philadelphia to Savannah; the Frayer-Miller which won the Long Island economy test; the Matheson hill climb winner, and the 12-cylindered Maxwell, besides several others of racing fame.

By the time the parade started, Columbus Circle was a-bustle with activity, redolent with gasolene and patchouli and coughing gasolenically. The line of march was down Broadway to Twenty-sixth street, turning up Fifth avenue to Fifty-seventh, where Broadway was again touched. After circling Columbus circle the procession moved up Broadway to 110th street, turning and returning down the other side of Broadway until Eighty-fourth street was reached, where the paraders crawled in review before Judges Hoyt, Scarritt, Wheeler, Morrell and Parker, who were to pass upon the most beautifully decorated and the most grotesque cars.

By the time the parade got to the reviewing stand the divisions had become slightly mixed. This was the unfortunate part of the affair. When the flower of the younger set began to exude from the stage doors after teacher tapped the dismissal bell, at nearly 11, their eyes ablaze with the innocent merriment that one sees only on the facets of a cut glass shell of pilsener or in the animated orbs of a young maiden

whose mother has given her permission to stay out as late as she likes, so long as Hazel and Pearl and the other girls are going, not one of them but expected that the parade had long since disbanded, They were agreeably disappointed, for it wasn't over until about midnight. This was the mistake some other persons along upper Broadway made. When all the antiques and racing cars in the first division had

"THE KING" ON HIS MOVING THR . . .

made the turn at 110th street, and the 1908 models had taken another hour to do the same thing, the biggest part of the crowd thought the affair was over, and consequently were disappointed at not seeing the decorated cars and floats, of which there had been so much talk and expectancy.

It was a long wait after the ordinary cars had raced with each other up Broadway until the decorated section appeared, and the crowd had thinned considerably. Those who waited were rewarded, for the decorated cars, although there was not a great number of them, and the division of commercial vehicles which brought up the rear, were the features of the procession.

The judges unanimously decided that the Oldsmobile entered by General Cutting was the handsomest in the way of decorations, and there was no possibility of disagreement. The effect was superb. The car was covered with California pampas grass, and assumed the form of a barge floating down the Nile with a good looking Cleopatra dancing attendance on not such a good looking Marc Anthony. Second prize went to Benjamin Briscoe's Maxwell, which was profusely decorated with lilacs, roses and lilies, and a plentitude of grass, to typify "Spring." Another Oldsmobile received commendation from the judges. It was festooned with red and white electric lights and carried four young women dressed to represent the nations of America, France, Germany and Italy, as leading in the production of motor cars. One car simply studded with vari-colored incandescent lights along the body line excited comment. It is only the to say, however, that New Yorkers did not respond with

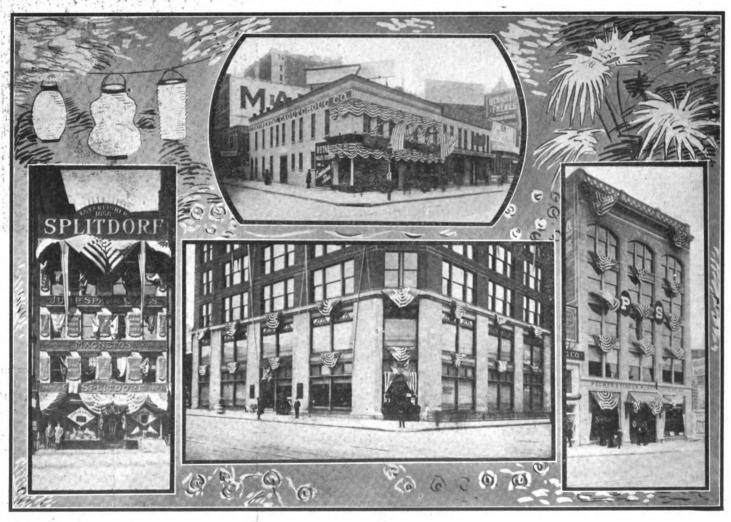

decorations as, pretty as have been seen in some other cities where decorated parades were held. Many of the cars could have been made attractive with only Japanese lanterns but it was a noticeable fact that, with one or two exceptions, not one Japanese lantern was in evidence.

There were several grotesque cars which, coming late, as did the commercial division, were not appreciated as fully as they deserved, for the reason that most of the

while behind trotted a dilapidated horse, the only one in the parade. A large canvas sign bore the inscription, "The passing of the horse." Dr. Julian P. Thomas, the aeronaut, had a wind wagon, while J. E. Fischer's car was uniquely decorated with college flags. One of the most conspicuous grotesque effects was the White Rats' presidential car, which carried five examples of presidential timber. C. J. Stine, who drove the car, made up Secretary Taft,

Wallace, Knox, and E. C. Buchigani, Olds-mobile

There were considerably more than one hundred vehicles in the commercial division. The biggest individual showing was made by the New York Transportation Co., whose superintendent had been elected king of the carnival by a popular voting contest conducted by a metropolitan newspaper. This company had a score of taxicabs, hansoms, landaulets, broughams, vic-

CONTINENTAL, SPLITDORF, STUDEBAKER AND PALMER & SINGER IN CARNIVAL TRAPPINGS

crowd had left Broadway, the upper part of it, at any rate, by the time the divisions reached there. The most grotesque car was that entered by the De Witt Motor Co., and it carried off the prize in this class. The car was rigged as a burlesque "around the world racer," a sign on the rear apprising the crowd that the car left Paris April 7, 1906, and had arrived in New York April 7, 1908, which was Tuesday night. The car looked as if it had been through a siege. A big cooking stove was placed on the hood, while several clothlines held all the equipment of a circummundane racer. A goat, "captured on the back steppes of Siberia," comprised part of the equipment.

A bit of pathos centered around the float designed to represent the passing of the horse. This showed a car pulling a truck

while the other occupants were disguised as President Roosevelt, "Uncle Joe" Cannon, William J. Bryan, and Governor Hughes.

Among the other decorated cars in the line were those of C. R. Teaboldt, Garford, bedecked with flags; George Goltzer's festooned Ford; E. Detmeld's chrysanthemum covered. Oldsmobile; James Unger's Ford, and Edwin Blumenthal's Olds, both covered with flags. C. V. Palmer's car, covered with bunting and acetylene lights presented a striking display. H. T. Pond's Rambler was decorated with lemons and G. E. Knabe's Lozier was a pretty picture with its floral display. Some of the drivers who employed flags and bunting for decorations were Bronson Howard, Oldsmobile; Dr. W. H. Navis, Mitchell; G. H.

torias, park wagons and sight seeing cars decorated in green and gold. The 50,000 candle power searchlight mounted aloft on one of the vehicles lighted Broadway for more than a mile, while a specially designed confetti gun, worked by compressed air, caused the street cleaning department to mutter uncomplimentary things the following morning. Another feature of the transportation company's display was an oxyhydrogen automobile cannon, which made the night hideous with the reports from its twelve barrels. In this gun a mixture of oxygen and hydrogen gases was exploded by an electric spark, in twelve tubes of various sizes. The operator did not get tired of working it, either.

One interesting float was that of the Ficklin body building concern, which com-

prised a big truck with men working at a forge and anvil making irons for a cape top. Milton Lusk, with his Gabriel horn pipe organ, also was in evidence. The most scintillating float of all, however, was the immense creation depicting Goodrich tires, which fairly dazzled with electric lights. A huge automobile wheel and tire in incandescent lights surmounted the creation. Practically every make of commercial vehicle was represented in this division, while all the metropolitan newspapers, and a number of department stores, express compaies and other business concerns showed up in numbers.

With flags and bunting, with a mass of color in which the red, white and blue is blended with the flags of the various countries, Broadway, especially that part of it that has become known as "automobile

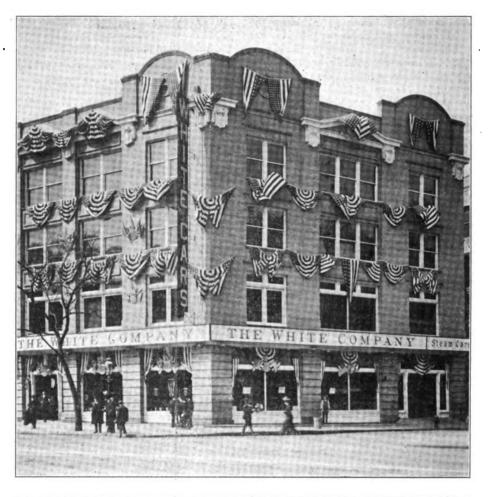

GARFORD BRANCH IN GALA DRESS

row." is attired in gala dress in honor of the Automobile Carnival in celebration of the tenth anniversary of the introduction of the automobile in the city of New York.

Almost without exception the buildings, that in whole or in part figure in the automobile industry, have been decked out with color, and many are the forms and designs which have been employed in the decoration scheme. Flags are fluttering everywhere, and are interwoven with streamers and bunting. Broadway from Forty-second street to Eightieth street is a mass of color, while side streets and adjacent thoroughfares add their mite to the whole until that part of the city suggests that some event of national importance is about to occur, or even now is going on.

As one turns into Broadway from Fortysecond street, after passing some gaily decorated "lobster palaces" the eye encounters the Garford headquarters, festooned with flags and streamers from roof to sidewalk; further along "the line" the im-

WHITE, CORBIN AND AMERICAN LOCOMOTIVE DECORATIONS

mense Studebaker building displays the national colors in profusion, simply but most effectively. Then there is the Goodrich branch with an electric arch and the Palmer & Singer building, with flags, festoons and shields.

The west side of Broadway from Fifty-first street to Fifty-second street, presents an unbroken line of decoration. Splitdorf's downtown headquarters is almost hidden from view by the decorative scheme which covers the front of the building with the flags of all nations. The home of the Fords is also decorated from street to housetop, as is the building of Wyckoff, Church & Partridge, where the Stearns is housed, on the corner of Fifty-sixth street, and also the Rainier building just west of it on the side street.

From Fifty-fourth to Fifty-sixth streets on the west side of "the row" the decoration is broken only by the intersecting street, and so it is all along the way. At Sixty-second street the White Co. on the corner, and the Rambler and a taxicab company adjacent to them on the side street, have united in a uniformity of decoration that is most attractive, while the Panhard and C. G. V. express their approval by flags and streamers, to which the American Locomotive Works has added a large electric Berliet hub cap. Yet these are not all, nor nearly all, for festival colors mark the places of the Oldsmobile and Northern; the Cleveland, Smith-Haven Co., and the Hercules Leather Tire Co.: the St. Louis Car Co., who sell the American Mors, the Rainier, and R. M. Owen & Co. The windows of the Hartford Rubber Works are full of flags, the Autocar place is decorated, the Fiat has the American and Italian flags, while the Maxwell-Briscoe Co., on Fifty-ninth, street, are strictly American. The Renault, Ajax-Grieb Tire Co., and the Continental Caoutchouc Co. all have elaborate dresses, and to mention each would be but a repetition of the trade directory. For about two miles Broadway is brilliant and enthusiastically decorated. It presents a panorama of color that fittingly welcomed the parade, which was the opening feature of "Carnival Week."

This afternoon (Thursday) the hill climbing contest, to be held on the short but steep incline known as Fort George hill, in the north end of the city, doubtless will attract thousands to that feature of the carnival. Standing starts will rule, which will eliminate the grave possibilities attendant upon wriggling through the elevated structure pilars at the bottom of the hill. If all the cars entered take part it will be the biggest hill climbing contest ever held in America. When the entries closed last night there were 84 entries in the 11 events.

In the Free-for-all the entrants are: Pennsylvania, Renault, Apperson, Matheson, Pope-Hartford, Stevens-Duryea, Fiat, Stoddard-Dayton, two Knoxes and three Whites.

PUZZLES IN JOBBERS' PRICE LISTS

Curious Comparisons Afforded by Some New Catalogs—Standard Supplies Quoted at Varying Figures.

He is a wise man who knows his own father. But wiser by far must be the manufacturer of automobile accessories who is able to tell what his list price will be made to appear even after he sets the figure.

When the owner of an automobile makes application for this registration number and license to the proper authorities of the State in which he lives, his name and address is sent throughout the country to those who are sufficiently interested in the matter to purchase the information. As a result of having his name sent broadcast the man to whom the registration is granted at once becomes the recipient of all sorts of literature pertaining to automobiles and the accessories thereof. Prominent in the mail received from this source will be catalogs from the jobbers and dealers, and so-called discount houses, and when all are carefully conned, perplexity and doubt ensues until finally the new votary to the sport of automobiling is dazed by the mass of conflicting statements in regard to prices, which ofttimes bring the conclusion that the automobile industry is a game, rather than a business founded on and conducted with, business principles.

As the season of 1908 opens the jobbers' catalogs are obtaining wide circulation. Seven of these catalogs, received from jobbers and "discount houses," whose headquarters are in different cities throughout the United States, were compared in relation to their respective prices on standard goods of well known manufacturers. The result of the comparison shows such a wide variation in the prices of articles which by every rule of established business methods should be sold for the same price, that it is impossible to determine by what system of mathematical computation the list prices were arrived at. In the appended table 15 well known articles are named together with the "list" prices of the different jobbers. In arranging this table it was necessary to select articles which, for the purpose of comparison, should be the

same and made by the one manufacturer. This has been done, and the various prices that are quoted refer to the same thing, an article unchanged in style, workmanship and date.

One of the peculiar features brought our in the examination of the catalogs was the fact of the same article, a hammer, being listed on one page at \$1.30, and on another page of the same book the list was \$1.00. How these two prices can be reconciled it is hard to say, yet after looking at all the catalogs, one is not surprised at any figures which may be printed.

Cut Rate Tires for Club Members.

The Automobile Club of Maryland has gone into the tire business. That is, it is buying tires in large quantities direct from the manufacturers and is selling to ats members at practically wholesale prices, according to advices from the Monumental City.

Local dealers, many of whom were prime movers in the organization of the club, are not in sympathy with these plans, naturally, which will mean a cut in their tire trade. The club has more than 200 members and if every one purchases tires through the club the loss to the dealers will amount to considerable in the course of a year. It is said that before placing an order for \$500 worth of tires with a New York concern the club approached the local dealers and asked them to give members a special rate on tires. The dealers discussed the request at a meeting held a week ago and while they would not give out the result, it evidently was not satisfactory to the club, as an order was immediately sent to New York City. President Reese did not deny the purchase.

"We could not come to terms with the local dealers," he is accredited with saying," so members of the club subscribed \$500 to buy tires in New York. This is as an experiment, which, if successful, will be continued."

It is quite as important to keep the vibrator of a high tension magneto in order as it is to attend to the wants of the same device when attached to an ordinary coil. Because the part is well hidden from view ordinarily, however, the tendency is for it to be overlooked except when its cry for adjustment becomes absolutely imperative.

VANDERBILT FAVORS THE FREAKS

Revised Rule for the Cup Race Encourages
Their Construction—Four Courses
Likely to be Available.

William K. Vanderbilt, Jr., has made plain that he cares little how abnormal may be the cars that compete for the massive silver cup which bears his name. It had been thought possible that he would consent to make the limit one of reasonable piston displacement instead of weight, but this supposition was routed at a meeting of the racing board of the American Automobile Association, held on April 2d, at which the doner of the trophy was not present, though he was in touch with the chairman by telephone. As a direct result of his wishes the rules governing the Vanderbilt cup race not alone permit, but encourage the construction of freak racers.

The rules governing the race were considered, but were left unchanged, save that the number of cars which may be entered by any competing country has been raised from 5 to 10. But by far the most important change was that which relates to the weight limit. The revised rule requires a minimum weight of 900 kilograms (1,983.6 pounds), and a maximum weight of 1,200 kilogram (2,644.8 pounds). In the former races for the Vanderbilt cup the maximum weight allowed was 2,204 pounds, but as this limitation would render ineligible many of the foreign cars now being built for the big races abroad, it was Vanderbilt's personal desire that the maximum limit be increased in order that these cars might compete in his race.

Though the date and place of the race will not be announced until after July 1st formal applications have been received fram Savannah, Ga., and St. Louis, Mo., and in addition to the possibility of the Long Island Parkway, it is said that another course in the vicinity of Bridgeport, Conn., is receiving consideration.

While no entries have been received, assurances have been given that two Locomobiles, two Thomas Fliers, two Appersons, two Isotta-Fraschini, one Darracq and a Renault will compete. The entry fee will remain at \$1,000 until Sept. 1; after that date it will be doubled.

Winged Foot Adopts Automobiles.

The New York Athletic Club, prob bly the wealthiest and largest club of its kind in America, has "gone in for" automobiling. Announcement to the effect that the big club will create an automobile section was made last week, when the project was formally launched at a dinner given in the city club house at which about seventy-five members of the club were present.

From the fact that 480 cars are owned by the automobilists that are included

among the 5,200 members of the club, it would seem a wonder that the New York Athletic Club had not long ago created an automobiling department. The additional fact that many of its automobilists are members of the Automobile Club of America, which at present is not having plain sailing, tend to make the announcement of more than usual interest at this time.

Walter Wilson, president of the Mercantile Trust Co., presided at the dinner at which the project was launched and at the speakers' table were Robert Lee Morrell, President George W. Kuhlke, W. L. Mitchell. Judge Warren W. Foster and George B. Hulme. Mr. Mitchell offered a resolution that the formal organization of an automobile section be proceeded with, and this was carried by a unanimous vote. Details of the organization work were left to be settled by the automobile committee and will be largely in the hands of E. B. Gallaher, who has been chiefly responsible for the creation of an automobile section. His associates are Herman Liebert and Thomas E. Deeley, who have had charge of the automobile affairs of the club for a long time.

The new club, or more properly, the new section, will officially be titled the Automobile Section of the New York Athletic Club, and as more than 200 members already have promised to join the new section, it is stated it doubtless will start with a flourish. Arrangements already have been made to secure automobile insurance for members of the automobile section at a reduction of 20 per cent. from regular rates, and it also was announced that arrangements will be made to secure supplies and accessories for members at somewhat reduced rates.

No Postponement of Briarcliff Race.

Because of talk of postponement that had arisen, at a meeting of the entrants and promoters for the Briarcliff trophy stock car race, which was held on Thursday last, April 2d, it was definitely decided that the race would occur on Friday, April 24th, as originally scheduled, the promoters leaving the decision to the entrants. The permit for the race, issued by the Westchester authorities, stipulates that the contest shall last not more than 10 hours, and as several of the entrants have expressed opinions that the condition of the course will not permit of an average speed greater than 35 miles an hour, it is probable that the distance of the race will be not more than 300 miles. It was the indifferent condition of several sections of the course that provoked the talk of postponement.

The authority to make the final decision as to the distance of the race and the time of starting is vested in the racing board of the contest which consists of Robert Lee Morrell, chairman, S. B. Stevens, Alfred Reeves, E. T. Birdsall, and C. R. Mabley. Two late additional entries have been accepted, thereby bringing the total to 22.

NEW CUP FOR STOCK CAR RACE

Chairman Thompson Proffers Trophy for International Contest—The Idea Regarded with Favor.

That there should be but one race for stock chassis held in America each year, but that it should be international in character, was the opinion expressed by representatives of the National Association of Automobile Manufacturers, the American Motor Car Manufacturers' Association, the American Automobile Association comprising the Central Conference Committee. which met in New York City Tuesday morning last, 7th inst. Coincident with this expression of opinion Jefferson De Mont Thompson, chairman of the racing board of the American Automobile Association announced that if the manufacturers will support such an international stock car contest, he will give to the American Automobile Association, as the governing body, a cup valued at \$3,000, which shall be competed for annually in one great stock car event. The trophy would be known as the Jefferson De Mont Thompson Cup, and would be similar to the Vanderbilt and the Glidden trophies. Chairman Thompson's offer was enthusiastically received and the representatives of the trade associations stated that they would bring the matter before their respective bodies at the earliest opportunity.

The representatives present at the meeting were President William H. Hotchkiss, Jefferson De Mont Thompson, Robert L. Hooper, Frank B. Hower, Fred H. Elliott. Louis R. Spears and Oliver A. Quayle, representing the American Automobile Association; S. D. Waldron and Windsor T. White, for the National Association of Automobile Manufacturers; Alfred Reeves, R. M. Owen and Harry Fosdick. of the American Motor Car Manufacturers' Association.

F. B. Hower, chairman of the touring board of the governing body, who intends to conduct a tour from Buffalo to Saratoga, N. Y., in July, outlined his plans for the run. He received several suggestions which, it is stated, will be incorporated in the rules which Chairman Hower made public this week. The proposed convention of the American Automobile Association, to be held in Buffalo, preceding the start of the tour, came in for some discussion, and it was the opinion that good roads should be the keynote of the convention.

The Automobile Club of Bridgeport, Conn., has elected these officers for the ensuing term: President, Frank T. Staples; vice-president, T. A. Strong; secretary, Frank W. Bolande; treasurer, L. B. Powe; governors, Silas Burton, Ralph M. Sperry, and A. K. L. Watson.

CMYKHANA ENDS CHICAGO CARNIVAL

Interest in the Events Leads to Repetition of the Meet—Skilful Contests but no Perfect Final Scores.

Despite weather that was cold and cheerless and that nearly caused a postponement the gmykhana arranged by the Chicago Automobile Trade Association as the feature of its "spring carnival week," attracted several thousand people to that part of Michigan avenue known as the "row" on Wednesday night last, 1st inst. There were five events but the feature of the novelty meet was the teeter board contest, in which the drivers were called upon to balance their cars upon a teeter board 20 feet long and 6 feet wide resting on an 18-inch fulcrum. Nine cars managed to score perfect counts in this event. Of almost as much interest was the spearing contest, in which the drivers were required to spear potatoes suspended from a string, while steering the car with the other hand. A miss and consequent bump in the face from the potato caused considerable amusement to the spectators.

The obstacle race caught 16 of the 24 cars competing, there being penalties for touching the blocks of wood that lined the short course, and which left only a clearance of four inches, which therefore required careful driving. In the average race, the object was to go a four miles an hour pace. No one "hit" it to the dot but two cars, the Pierce Arrow and the Mitchell, came very close, escaping with only one point penalty. In the apple race, in which the driver was compelled to pick an apple out of one bucket and deposit it in the next, repeating several times, only two cars were given perfect scores. They were the Franklin and the Holsman.

Following the completion of the events the technical committee of the association went into executive session and evolved Lanahan's Ford a winner with seven points against it, the award being made for the least number of points in the combined events. The scores of the other cars were: Mitchell, 28 points; Pierce-Arrow, 31; Rambler, 32; Stoddard-Dayton, 35; Franklin, 35; Woods, 37; Diamond T, 40; Overland, 44; Holsman, 64; White, 55; Autocar, 63; Knox. 64; National 65; Welch, 66; C-F, 67; Baker electric, 70; Royal, 73; Pierce-Racine, 76; Thomas-Detroit, 80; Lambert, 83; Maxwell, 87; Queen, 87; Apperson. 94.

So successful was Wednesday night's gymkhana that the dealers decided to repeat the affair on Thursday night, and four more contestants than on the preceding night lined up for the fun. The events were the same and the winners evolved by the addition of penalties in all five events as on Wednesday night. It was demonstrated that practice makes perfect, for a majority

of the drivers made better scores than on the first night. The winner turned up in one of the new comers, an Elmore touring car driven by Harry Sultzpaugh, who had only one point against him, that lost in the spearing contest, when he failed to catch one of the potatoes on the point of his spear.

Eight of the cars beat the total count of the winning Ford runabout of Wednesday night, when Lanahan got off with seven points. Lanahan bettered his previous score by three points and tied for fourth place with the Mitchell and the Knox. The total scores of the cars were as follows: Elmore, 1; Overland, 2; Buick, 4; Ford, Mitchell and Knox, 5; Oldsmobile and Moline, 6; Stoddard-Dayton and Rambler, 7; Diamond T, 9; Pennsylvania, 12; Pierce-Arrow, 25; Franklin, 27; C-F, 30; Autocar, 33; Stearns, 33; White and Lambert, 35; Welch, 37; National and Woods electric, 39; Queen and Corbin, 57; Pierce-Racine, 78; Thomas Forty, 88; Cleveland, 89; Simplex limousine, 105.

Three Clubs Choose Their Officers.

At its annual meeting last week the Rochester (N. Y.) Automobile Club elected the following officers: President, H. G. Strong; secretary, Bert S. Van Tuyle; treasurer, Rudolph Schmidt; governors. James E. Gleason, W. W. Hibbard, John E. Morey, F. A. Mason, Richard T. Ford, George F. Gordon, John S. Bingeman, A. F. Crittenden and Harry S. Woodworth. The secretary's report showed that the club has gained 113 members since the last annual meeting. Last year 22 members availed themselves of the privilege extended by the customs authorities of the Dominion of Canada to bond their cars into and out of Canada by paying a fee of \$5 to the secretary and it was announced that that arrangement will be continued this year.

Formal organization of the Spokane (Wash.) Motor Club was effected last week by the election of the following officers: President, H. Louis Schermerhorn; vice-president, O. B. Sellers; secretary-treasurer, Lawrence Jack; directors, the officers, H. L. Lilienthal and John Sengfelder.

Augusta (Ga.) automobilists have effected a reorganization of the Augusta Automobile Club. The new officers are: President, V. B. Garrett; first vice-president, F. B. Pope; second vice-president, J. H. Davidson; secretary, Dr. Eugene Murphy; treasurer, C. D. Carr.

Norristown Plans New Club House.

The Norristown (Pa.) Automobile Club evidently is in a flourishing condition. At the last meeting a committee was appointed to take charge of the erection of a new club house on De Kalb street, to cost \$10.000. The club has more than 200 members, a number having been enrolled at the last meeting.

GERMAN RETURNS TO REPAIR SHOP

Much-Repaired "Racer" Breaks Down Once More—French and Italian Entrants Finally Reach San Francisco.

Fate has been very unkind to the German entry in the New York to Paris struggle. Unless it be found feasible to transport the Union Pacific railroad shops to Alaska, it looks as though the Protos car will have to become a fixture in Utah. At last accounts, it was once more being repaired at the busy Ogden shops of that resourceful corporation. The other three contenders in the globe-girdling stunt are at present stationary in so far as their own efforts are concerned. The Thomas, carrying America's laurels, is supposed to have arrived at Valdez, Alaska, but the wires are down, and information is lacking. The Italian and French representatives are in San Francisco-waiting for the ships that sail into the frigid north, and upon which they will continue their race.

Last Thursday the French party, in charge of the De Dion car, encountered a sand storm and a few other difficulties in the heart of Death Valley. A delay of 22 hours was involved, and the incident brought about the first death which has been recorded to the credit of the undertaking. The driver of a rescue team sent out to aid the crew of the stilled car, in some way fell from his seat, breaking his neck. On the return of his team to the starting point, a second was sent out, which overtook the car a little beyond Stovepipe. Progress from that point to San Francisco was unbroken except for a comparatively. minor delay somewhere beyond Tulare. The hopes of France and Italy were reduced to a common plane when the De Dion rolled into San Francisco Tuesday afternoon.

The Protos, minus its lieutenant-commander, who had gone to Salt Lake City for rest and to attend to some "business" of his own, reached Ogden in the regular routine of its travels, on Thursday, and turned up at Kelton, Friday night. Next morning it started out bravely, but soon suffered a broken differential. Sunday was spent in making repairs. Monday a second start was essayed with the same unhappy result as before. So the car was returned to Kelton, and the U. P. authorities appealed to to send out a special train over the otherwise disused track between Kelton and Ogden and pack it back to the fi miliar shops. Meantime, the gallant Koeppen has hied himself off to Seattle where are all the spare parts intended for Alaskan consumption. They are at present all bound 'round with a red tape of customs formalities and obtainable only with difficulty.

RULES FOR MR. HOWER'S CONTEST

Conditions Under Which the Next Glidden
Tour Will be Made—Subject to Change
at Hower's Discretion.

Long awaited, the rules for "the Fifth Annual Reliability Touring Contest of the American Automobile Association, including the contest for the Charles J. Glidden Trophy for touring cars, and the Frank B. Hower Trophy for runabouts," which will start at Buffalo on July 9th and end at Saratoga, N. Y., on or about July 24th, were issued this week. It is made plain that the tour is not "of the American Automobile Association," or even of the Touring Board of that association, but of and for the chairman of the touring board. It is first and foremost a Chairman Hower tour.

The rules make it unmistakably plain that Chairman Hower is both the "whole thing' and the "real thing." The touring board has been set back in the zeroic shade. For the touring board is Hower-Frank B. 11-o-w-e-r. The rules state that "the chairman of the touring board shall be manager of the tour, with full power to enforce the rules, render the decisions and do anything else that would be within the province of the touring board of the American Automobile Association." This is "going some," but it is a mere dog trot in the line of sweeping authority, for a succeeding rule says that "the chairman reserves the right to alter or amend, suspend or repeal these rules from time to time, up to and including the end of the tour and final award, as may in his judgment be deemed expedient," in other words, Hower is the rules; why, in the face of this astonishing provision, any rules were ever printed, is difficult of comprehension.

This isn't all that Chairman Hower is, by any means. He-not the Touring Board, but He, the Chairman-reserves the right to refuse any entry, and after specifying that each entrant must furnish at his own expense, one official observer for each car entered, the chairman makes it plain that those observers must be acceptable to him, and subject to his instructions. If the observer is incompetent or fails to attend to the duties specified by the Chairman, he may suspend that observer and appoint a substitute at the expense of the entrant. If the entrant or official observer fails to observe the rules, or any other rules made by the chairman, or even fails to show proper courtesy to the chairman, or perhaps to the other officials of the tour, he may be disqualified. Thus is it made plain that no one may be allowed to answer back if the everything doesn't go just right. Again, the chairman shall have the power to disqualify any car for traveling at any speed which he, the chairman, may consider excessive under the conditions existing at the time without reference to the rules. After being disqualified a car may continue on the tour as a "non-contestant," that is, if the chairman condescends to permit it.

Despite glowing press agent advance notices that the chairman answered every criticism and corrected every fault of former tours, there is nothing startling in the rules for the 1908 tour, excepting the fact that Chairman Hower is more than ever the whole thing, and that the touring board of the governing body has not even a say so in the chairman's tour. The entry fee has been fixed at \$200 instead of \$100 as formerly. The ridiculous practice of allowing contestants to come within a few yards of controls and remain, watches in hand, until the proper moment for crossing the line arrives, will be continued.

The Glidden trophy will be contested for by teams, as last year, divided into four classes, designated as follows:

Class A, Cars valued at \$3,500 and upwards; Class B, cars valued at \$2,500 and up to \$3,500; Class C, cars valued at \$1,500 up to \$2,500, and Class D, cars valued under \$1,500. When the daily running time shall exceed 7½ hours the running time of Class B will exceed that of Class A 15 minutes; Class C will exceed that of Class A 30 minutes, and Class D will exceed that of Class A 45 minutes. When the daily running time is less than 7½ hours, Class B will exceed that of Class A 10 minutes, and so on.

Penalties will be imposed for reaching controls ahead of, or behind running time, two minutes being allowed for variation of time pieces. The penalizations per minute or fraction thereof in excess of two minutes at controls will be worked out in proportion to the number of cars on each team. For instance the club team will start with an initial credit of 1,000 points, and the penalization per minute at controls for a three car team will be 1/3 point; for a four car team, 1/4 point and so on. In like manner are the penalizations per dollar or fraction thereof of value of parts per manufacturer's price list to be imposed. The cars must be equipped according to catalog specifications and all must carry mufflers and mudguards. Those competing for the Glidden Trophy shall be equipped with regular standard touring car bodies with seats for four or more passengers, of an average weight of 125 pounds each, or equivalent in ballast.

No replacements, replenishments, adjustments or repairs, shall be made upon any contesting car between the time it shall have been registered in at any night stop of the tour, and the time it shall register out the next morning. All replacements, etc., must be inventoried at the start and carried on the tour, and if replacements other than those are made the car may continue in the tour, but not as a contestant. Tires are excepted. Repairs must be made by the driver or mechanic, or by both. Should road conditions be so bad that a

car cannot get sufficient traction to move, or is ditched, after reasonable effort has been made to extricate it, towing or other external means may be used to relieve the immediate distress only.

Two classes are provided for in the tour for the Chairman Hower Trophy, which is for runabouts: Class A, for cars valued at \$1,500 and upwards, and Class B, for cars valued under \$1,500. The difference in running time between the classes shall be the same as in the classes for touring cars competing for the Glidden Trophy. The method of scoring is practically the same. As this is an individual contest each car will receive an initial credit of 1,000 points and a penalization of one point per minute either way in excess of two minutes leeway at controls will be imposed, and likewise a penalty of one point per dollar and fraction thereof of value of parts replaced.

Under the head of "Hotel Accommodations" it is stated that a certain company which has conducted tours will have charge of hotel accommodations. Although there was considerable grumbling last year about hotel accommodations and the exorbitant rates charged for ordinary rooms it never theless is stated that "as the reputation of this firm is well established the tourists need have no fear but that they will receive the best of service." For fear that some of the contestants who have been through other Glidden tours might take exception to this statement the chairman "particularly requests that no hotel reservations be made by individuals."

Date Set for Dead Horse Hill Climb.

No time has been lost by the Worcester Automobile Club in planning for a revival of the Dead Horse Hill climb, made possible by the new Massachusetts law authorizing the mayor and aldermen of cities and the selectmen of towns to temporarily close public roads for automobile contests. The board of governors of the club held a special meeting on Tuesday, 7th inst., and appointed a committee to confer with the selectmen of Leicester and the mayor and aldermen of Worcester regarding a permit for a hill climb on June 6. The course on which this particular "knob" is located lies partly in Worcester and partly in Leicester. Plans for the contest, so far as they were considered at this meeting, will bar all high powered special cars and freaks. Only stock cars will be permitted to compete.

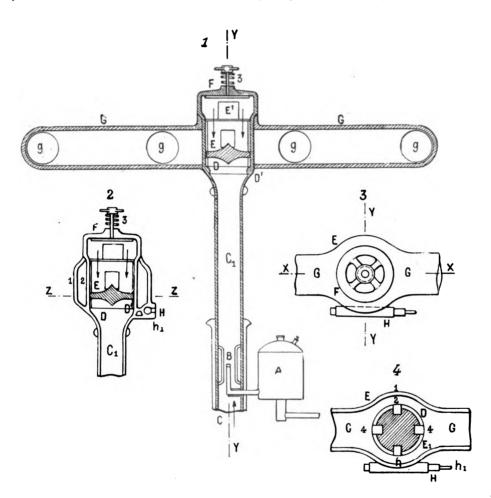

Besides a number of breakfast food factories and sanitariums, Battle Creek, Mich., now has an automobile club, organization having been effected last week with forty charter members. The club will join the American Automobile Association through the State association. The officers elected were: President, N. E. Hubbard; vice-president, V. E. Bush; secretary, F. J. Rathbun; treasurer, Frank Evans; directors, C. L. Post, D. H. Frazier, J. C. Grandon and G. W. Meachem.

NEW MIXING METHOD FROM FRANCE

Designed to Assure Constant Conditions at the Jet—How the Effect is Brought About in a Carburetter.

There are many good reasons for believing that the present method of vaporizing the fuel and mixing it with air at a point quite remote from the engine, may not be adhered to indefinitely, but that some other and more approved system may ultimately take its place. Of the several arrangements in present use which differ from the ordinary carburetter in this respect, that re-

With this arrangement the particles of fuel which are not vaporized, instead of being carried through to the cylinders are projected against a diaphragm which is placed across the head of the stand pipe. This diaphragm is in double conical form, and serves to deflect the rich fuel vapor with its entrained particles of liquid fuel into a horizontal plane, while it also deflects the stream of air of dilution, which is admitted from above similarly, thus affording ample opportunity for the ingredients to mingle before the cylinders are reached. The air is admitted through apertures in the sides of a rotating throttle sleeve which register with corresponding openings in the seating.

cently devised by the Société Delaunay-Belleville, presents several characteristics which are more or less admirable as well as novel.

In this system, the fuel vapor is created in a relatively small mixing chamber in somewhat the usual way except that a very rich mixture is formed—much too rich, in fact, for ordinary consumption. The dilution of this rich base, instead of being carried on in the mixing chamber proper, however, as is done commonly, takes place as the gas enters the distributing manifold. The effect of this is to establish conditions in the region of the jet which are much more nearly constant than are obtained ordinarily.

The accompanying illustration shows the general arrangement as well as several 'sections of the mixing and throttle valve, taken along the lines indicated. A, is the float chamber, B, is the simple jet, and C, the ports through which the basic supply of air is admitted. The mixing chamber proper is at C', while D is the diaphragm which serves to mix the ingredients of the gas. As shown, it is roughly of bi-conic section, and is mounted co-axially with the cylinder D', with which it is made integral. The casing, E, in which the diaphragm is mounted, is furnished with a chimney, or draught tube, E', which has ports, 1-1, registering with the ports, 2-2, in the cylinder D, by means of which the supply of gas is regulated, through the action of the controller, F. This valve, which controls the admission of cold air to the mixture. is seated normally by means of the spring, 3, but opens in proportion to the suction created in the intake pipes leading to the cylinders of the motor. The flow to the right and left is established through the channels 4-4, formed between the casing, E, and the chimney E'. Independent connections enter the manifold, at g-g, leading to the inlet ports of the cylinders, H.

The controlling mechanism consists of the cam, H, which is screwed to the base of the cylinder, D', and has at its other extremity a link, attached to the rod, h'. which is regulated by means of a lever.

From the foregoing, it will appear that the system in question is, in a way, a sort of compromise between the ordinary methods of carburation in present vogue, and the principle of the mixing valve, which has never become at all familiar in automobile practice as regards the four-cycle motor. By many engineers it is regarded as a practical impossibility to form a uniform quality of gas except where a considerable length of induction pipe is employed. By others, this feature is regarded as more or less a necessary evil, incidental to the requirement of serving all of the cylinders with a uniform quality of gas. Current practice appears to show a leaning toward the shorter induction pipe, and it will be interesting to observe whether the idea here expressed affords any new light on the question.

Three Wheel Mounting and Traction.

Three-wheel mounting, and three-wheel traction, constitute the chief features of novelty in the British, Saunderson agricultural motor, which is an all-around utility vehicle, designed especially for farm work. The two front wheels of the vehicle are connected through a differential in the usual way, while the third is driven from what is essentially a continuation of the lay shaft of the transmission gear, and is in direct communication with the shell of the differential. As a result of this, neither of the front wheels is permitted to spin independently when on a smooth spot, so that a remarkably even degree of traction is claimed for the system. The affair, which is useful as a portable power plant for stationary as well as for tractive purposes, is driven by a 50 horsepower motor. The exhibit of this machine formed by all odds the most interesting feature of the thirteenth annual Cordingley show at Agricultural Hall, London, in so far as the commercial section was concerned, and for that matter of the entire exhibition. The section devoted to pleasure cars boasted some dozen or so of machines which had not been exhibited previously this season, one or two, in fact being new cars in the absolute sense, but not of a striking nature. The show was "unsanctioned," and appeared to labor under the stigma of the unlucky numeral.

REVISING THE NEW YORK LAW

Registration Fee to be Based on Weight of Car—Offenders to be "Posted" in Every County.

After nearly four years' service, the existing automobile law of New York State, which has operated satisfactorily and which is as fair to automobilists as is possible to expect, is in a fair way of being wiped off the books. On Friday last the measure prepared by the New York State Automobile Association formally was introduced into the senate by Senator Armstrong and into the House by Mr. Merritt. The bill closely follows the so-called uniform bill outlined by the American Automobile Association.

It sweeps out the present permanent registration fee of \$2 and in its place provides for annual registration based on the weight of the car, as follows: \$5 for machines weighing between 1,500 and 2,500 pounds, and \$5 additional for each 500 pounds in excess of 2,500. It is estimated that the revenue that will accrue for road improvement will amount to \$400,000. The exact language of the bill's reference to registration is as follows:

Sec. 2. Subdivision 1. Registration of motor vehicles.—Every owner of a motor vehicle which shall be operated or driven upon the public highways of this State shall, for each motor vehicle owned, except as herein otherwise expressly provided, cause to be filed, by mail or otherwise, in the office of the Secretary of State a verified application for registration on a blank to be furnished by the Secretary of State for that purpose, containing: (1) a brief description of the motor vehicle to be registered, including the name of the manufacturer, the factory number or mouel, if such number or model there be, the character of the motor power and the actual weight in pounds of the motor vehicle; (2) the name, residence and business address of the owner of such motor vehicle and the name of the county in which he resides; provided that if such motor vehicle is used or to be used solely for commercial purposes the applicant shall so certify and also state the business in connection with which such vehicle is so used or to be used.

Subd. 2. Registration book.—Upon the

Subd. 2. Registration book.—Upon the receipt of an application for registration of a motor vehicle or vehicles as provided in this section and in section four of this act, the Secretary of State shall file such application in his office and register such motor vehicle or vehicles with the name, residence and business address of the owner, manufacturer or dealer as the case may be, together with the facts stated in such application, in a book or index to be kept for the purpose, under the distinctive number assigned to such motor vehicle by the Secretary of State, which book or index shall be open to inspection during reasonable business hours.

Subd. 3. Certificate of registration.— Upon the filing of such application and the payment of the fee provided in subdivision six of this section, the Secretary of State shall assign to such motor vehicle a distinctive number and, without other fee, issue and deliver to the owner certificates of registration, in duplicate, in the form and size provided in subdivision three of section three hereof. In the event of the loss, mutilation or destruction of a certificate of registration, the owner of a registered motor vehicle may obtain from the Secretary of State an affidavit showing the fact and the payment of a fee or one dollar for each duplicate.

Subd. 4. Registration lists to be furnished county clerks.—The Secretary of State shall within sixty days after this act takes effect, and thereafter, on or before the first day of February of each year, furnish to the clerk of every county in the State a full and accurate list of all motor vehicles so registered, stating the distinctive numbers so assigned to them and the names, residences and business address of the owners, manufacturers or dealers, as the case may be, and once each month thereafter a similar list of the additional registrations, which additional list shall be entered by each county clerk upon the original list received by him. Such lists shall be filed by such county clerks and be kept as public records, open to inspection during reasonable business hours.

ing reasonable business hours.
Subd. 5. Re-registration annually.—Such registration shall be renewed annually in the same manner, and upon the payment of the same fee as provided in this section for original registration, such renewal to take effect on the first day of January of each year.

Subd. 6. Registration fees.—The following fees shall be paid to the Secretary of State upon the registration or re-registration of a motor vehicle in accordance with the provisions of this act; five dollars upon the registration of a motor vehicle having a weight of fifteen hundred pounds or less; ten dollars upon the registration of a motor vehicle having a weight of more than fifteen hundred pounds and not over twenty-five hundred pounds; and for every five hundred pounds, five dollars additional; provided that the owner of any motor vehicle which has been registered under existing law subsequent to the thirty-first day of December, one thousand nine hundred and seven, shall be entitled to a credit or rebate of the fees paid under such law for such registration; and provided further that for motor vehicles which in the verified application for registration are stated to be used solely for commercial purposes there shall be paid but one-half the foregoing fees and in no event more than ten dollars.

Subd. 7. Fees in lieu of taxes.—The registration fees imposed by this act upon motor vehicles, other than those of manufacturers and dealers and those used solely for commercial purposes, shall be in lieu of all other taxes, general or local, to which motor vehicles may be subject as personal property under the laws of this State.

Subd. 8. Sale and registration by vendee.

—Upon the sale of a motor vehicle registered in accordance with this section, the vendee shall, within ten days after the date of such sale, notify the Secretary of State of the same upon a blank furnished by him for that purpose, stating the name and business address of the previous owner, if known, the number under which such motor vehicle is registered and the name, residence and business address of such vendee. Upon filing such statement such vendee shall pay to the Secretary of State a fee of one dollar, and upon receipt of such statement and fee the Secretary of State shall file such statement in his office and note upon the registration book or index such change in ownership, and at least monthly notify every county clerk of the State of such

sales, each of whom shall immediately note the same on the list of registered vehicles received and kept on file by him as herein provided.

Section 4. Subd. 1. Registration by manufacturers and dealers.—Every person, firm, association or corporation manufacturing or dealing in motor vehicles may, instead of registering each motor vehicle so man-ufactured or dealt in, make a verified appli-cation upon a blank to be furnished by the Secretary of State for a general distinctive number for all the motor vehicles owned or controlled by such manufacturer or dealer, such application to contain: (1) a brief description of each style or type or motor vehicle manufactured or dealt in by such manufacturer or dealer, including the character of the motor power, the amount of such motor power stated in figures of horsepower, and the weight in pounds of each such style or type; and (2) the name, residence and business address of such manufacturer or dealer. On payment of a registration fee of fifteen dollars such application shall be filed and registered in the office of the Secretary of State in the manner provided in section two of this act. There shall thereupon be assigned and issued to such manufacturer or dealer a general distinctive number and duplicate certificates of registration in the manner provided by section two, which shall be in the form of plates as provided in section three, duplicates of which shall be carried or dis-played by every motor vehicle of such manufacturer or dealer so registered when the same is driven or operated on the public highways. Such manufacturer dealer or may obtain as many duplicates of such certificates of registration as may be desired upon payment to the Secretary of State of one dollar for each such duplcate.
Subd. 2. Registration to be co

Subd. 2. Registration to be continuing.—The registration of motor vehicles registered under this section shall not be renewed annually in the manner provided in section two of this act, but shall be a continuing registration; and the distinctive number assigned to the motor vehicle of any manufacturer or dealer shall be retained from year to year without further registration or fee except for the issuance of duplicate certificates as hereinbefore pro-

Sec. 8. Subd. 1. Registration of chauffeurs.—Every person hereafter desiring to operate a motor vehicle as a chauffeur shall file in the office of the Secretary of State. upon the payment of a registration for of five dollars, a verified application for registration on a blank to be furnished by the Secretary of State for that purpose containing. (1) the name and residence address of the applicant and that he is competent to operate a motor vehicle; (2) the trade name and motor power of the motor vehicle or vehicles he is competent to operate; (3) whether or not the applicant has been previously convicted of a violation of any of the provisions of this or any other motor vehicle law or ordinance, giving the date and place of such conviction and the provision or provisions of the law or ordinance violated.

Subd. 2. Chauffeurs' registration book; lists to be furnished county clerks.—Upon the receipt of such an application, the Secretary of State shall thereupon file the same in his office, assign the applicant a number and register him in a book or index which shall be kept in the same manner as the book or index for the registration of motor vehicles. The Secretary of State shall also furnish to the clerk of every county of the State within sixty days after this act takes effect and once each month thereafter, a full and accurate list of chauffeurs so registered, with their addresses

and the numbers assigned to each, in the same manner as provided in section two with reference to registered motor vehicles. Such lists shall be filed by such county clerks and be kept as public records, open to inspection during reasonable business hours.

Subd. 3. Chauffeur's badge.—The Secretary of State shall forthwith upon registering such chauffeur, and without other fee, issue and deliver to him a badge of aluminum or other suitable metal, which shall be oval in form with its greater diameter not more than two inches, upon which shall be stamped the words "Registered Chauffeur Number : State of New York" with the number inserted therein. This badge shall thereafter be worn by such chauffeur, pinned upon his clothing in a conspicuous place at all times while he is operating a motor vehicle upon the public highways of this State.

Subd. 4. Fictitious badge.—No chauffeur, having registered as hereinbefore provided, shall voluntarily permit any other person to wear his badge; nor shall any person, while operating a motor vehicle upon the public highways of this State, wear a chaufeur's badge belonging to another person of a fictitious chauffeur's badge.

Subd. 5. Unregistered chauffeurs cannot

Subd. 5. Unregistered chauffeurs cannot drive motor vehicles.—No person shall operate or drive a motor vehicle as a chauffeur, upon the public highways of this State after thirty days after this act takes effect, unless such person shall have complied in all respects with the requirements of this section, provided, however, that a non-resident chauffeur, who has registered under the provisions of the law of the State of his residence which are substantially similar to the provisions of this secton, shall be exempt from registration under this section; and provided further he shall wear the badge assigned to him in the State of his residence in the inanner provided in subdivison three of this section.

The bill also requires new numbers annually, the number of plates to be of different colors each year, and that these numbers be displayed on both the front and the rear of the vehicle; that they be fixed rigidly to the vehicle, so as not to swing, that the rear number be illuminated at night, and prohibits the display of any number other than that issued by New York.

The bill wipes out all specific speed limits, but for reckless driving it imposes a fine not exceeding \$250 for a first offense, and a fine of not more than \$500 or six months' imprisonment, or both, for subsequent offenses. County clerks will be supplied with the names of all who are registered, which record must be kept open for public inspection. When an offender is adjudged guilty, the clerks of all counties will be informed thereof, of which due note must be made in their respective records. The clause providing for this remarkable "posting" of offenders is as follows:

Subd. 5. Certifying conviction to the Secretary of State.—Upon the conviction of any person for a violation of any of the provisions of this act, the magistrate or other judicial officer before whom the proceedings are held, shall immediately certify the facts of the case, including the name and address of the offender, the character of the punishment and the amount of any fine imposed and paid, to the Secretary of State, who shall enter the same either in the book or index of registered motor ve-

hicles or in the book or index of registered chauffeurs as the case may be, opposite the name of the person so convicted, and in the case of any other person, in a book or index of offenders to be kept for such purpose, in alphabetical order. The Secretary of State shall send notices of all convictions for violations of section seven of this act, with the names and addresses of the persons convicted, and the judgments of the court on such convictions, to the clerk of every county in the State, who shall enter the same on the lists of registered motor vehicles or registered chauf-feurs as the case may be, opposite the name of the person so convicted, or on a list of other offenders which he shall maintain in his office as a public record in the same manner as the lists of registered motor ve-hicles and registered chauffeurs, and on due application furnish copies of such lists to the magistrates or other judicial officers of his county before whom violations of the provisions of this act are triable. If any such conviction shall be reversed upon appeal therefrom, the person whose conthe Secretary of State a certified copy of the order of reversal, whereupon the Secretary of State shall enter the same in the proper book or index in connection with the record of such conviction, and shall also notify each county clerk of the same.

In event of arrest the bill provides that surety company bonds or the automobile itself shall be accepted as bail and also that all fines and surplus accumulated from the registration fees shall be applied to the improvement of the public roads. These provisions are thus outlined:

Subd. 6. Release from custody, bail, et cetera.—In case any person shall be taken into custody because of a violation of any of the provisions of this act, he shall forth-with be taken before the nearest magis-trate or justice of the peace in any city, village or county, or before any accessible captain, sergeant of police or acting captain or sergeant of police who shall have the powers of a magistrate or iustice of the peace and be entitled to an immediate hearing; and if such hearing cannot then be had, be released from custody on giving a bond or undertaking, executed by a fidelity or surety company authorized to do business in this State, such bond or undertaking to be in an amount not exceeding the maximum fine for the offense with which such person is charged and conditioned for his appearance to answer for such violation at such time and place as shall then be indi-cated, or on giving his personal undertaking to appear to answer for such violation at such time and place as shall then be indicated, secured by the deposit of a sum equal to the maximum fine for the offense with which he is charged, or in lieu thereof, in case of the person taken into custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehi-cle with a written consent given at the time by the owner who must be present, with such judicial officer; or in case such judicial officer is not accessible be forthwith released from custody on giving his name and address to the person making the arrest and depositing with such arresting officer a sum equal to the maximum fine for the offense for which such arrest is made. or in lieu thereof, in case the person taken ir to custody is the owner, by leaving the motor vehicle, or in case such person taken into custody is not the owner, by leaving the motor vehicle with a written consent given at the time by the owner who must be present; provided that, in such case, the officer making the arrest shall give a receipt in writing for such sum or vehicle deposited and notify such person to appear before the most accessible magistrate, naming him, and specifying the place and the hour. In case such bond or undertaking shall not be given, or deposit made by an owner or other person taken into custody, the provisions of law in reference to bail, in cases of misdemeanor shall apply.

Sect. 11. Subd. 1. Surplus revenues to

Sect. 11. Subd. 1. Surplus revenues to be paid into State treasury.—The revenues derived from the registration fees provided herein shall be applied by the secretary of State in defraying the expenses incident to the carrying out and enforcement of the provisions of this act, and any surplus hereof shall be paid by the Secretary of State into the State treasury.

Subd. 2. Certain fines and penalties; to whom paid.—All fines, penalties or forfeitures imposed or collected for a violation of any of the provisions of this act, or of any act in relation to the use of the public highways by motor vehicles now in force or hereafter passed, which are imposed or collected under the sentence or judgment of a court of special sessions, held or presided over by a justice of the peace, shall be paid over by such justice of the peace within ten days after receipt thereof to the treasurer of the State, with a statement accompanying the same, setting forth the action or proceeding in which such moneys were collected, the name and residence of the defendant, the nature of the offense, and the fine, penalty or sentence imposed. On the first day of each month or within ten days thereafter, such justice of the peace shall make and forward to the treasurer of the State, a verified report of all criminal proceedings instituted or tried before him during the preceding calendar month for violations of any of the provisions of this act or of any act in relation to the use of the public highways by motor vehicles, which report shall set forth the name and address of the defendants, the nature of the offenses and the fines and penalties col-lected or imposed by such justice; which reports shall be public records and open to inspection during reasonable business hours

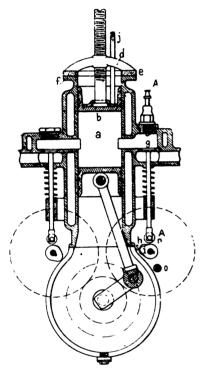

Subd. 3. Surplus revenues from registration fees and fines to be used for the maintenance of public highways.—All moneys coming into the State treasury pursuant to this act shall there be maintained as a separate fund for the maintenance and repair of the roads of this State and shall be apportioned as the State highway fund is apportioned.

The bill takes from local authorities all power to regulate the use of or to tax motor vehicles. The bill also provides that non-skidding devices may be used only when the highways are wet, slippery or covered with ice and snow, and contains the usual provisions exempting manufacturers and dealers from annual registration. There are also provisions requiring lamps, horns. brakes and the like, and provisions compelling motorists to stop on signal, and exempting non-residents of the State from registration providing they have registered their vehicles under similar laws in their own States and that they display their State numbers when operating such vehicles in this State. Among other "sops" for the automobilists is provision for a fine ci not more than \$500 for tampering with a

UNIFORM EFFICIENCY AT ALL TIMES

Varying Clearance and Charge to Effect Constant Compression—Novel Method Adopted in New Motor.

Methods of governing the internal combustion motor continue to multiply without end, a favorite method of attacking the problem, and perhaps the simplest which it is possible to imagine, being to vary the volume of the charge. Another is to vary the compression. One of the most recent developments along this line, which is embodied in the new Laval and Jallut motor,

SECTIONAL VIEW LAVAL AND JALLUT MOTOR

a French production, effects what is essentially a compromise of the two, without the drawbacks of either. It proposes the very novel expedient of firing the charge at constant pressure throughout the entire power range of the motor, and of varying the power output by varying the volume of charge exploded. To this end, the volume of gas inducted to the cylinder, and the compression are both altered proportionately in accordance with the power requirement of the motor at the instant.

The idea of employing variable compression for the purpose of governing the output of the motor is by no means uncommon. The difference between this and the more ordinary scheme is that as the compression is varied, the amount of gas taken into the cylinder also is varied so that as the volume of the compression chamber or clearance space is reduced, the charge taken in also is reduced, with the result that the compression pressure remains practically constant. The effect is practically that of using an infinite number of cylinders of

varying displacement, but with the same compression ratio, and so contrived that the strokes shall be equal. The particular advantages are that the ratio of burnt to unburnt gas-the co-efficient of dilution, in other words-remains practically constant, the mixture always is the same, the ignition always takes place under the same conditions, and is consequently perfectly dependable. The difference in power output is due to the expansion of varying volumes of charge, while the fact that when governed, expansion is carried out to a lower pressure than when running under full load, should tend to make the efficiency rise under light loads, instead of falling, as usually is the case.

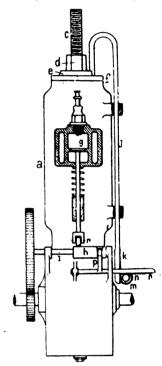

The manner in which this effect is secured is revealed by the accompanying illustrations which show a sectional view taken at right angles to the crank shaft, and another parallel to it, but showing only the inlet valve pocket in section, the remainder of the motor being shown from the exterior. It will be observed that the most striking difference between this arrangement and that of the ordinary motor consists in the employment of an upward extension of the cylinder which is fitted with a movable head in the form of a piston, both inlet and exhaust valves being placed in offset pockets, located at the upper end of the stroke of the working piston. The additional valve gear required to effect the variation in intake noted, comprises merely a cam of varying section and mechanism intended to displace it longitudinally to effect the desired changes.

Regarding the details more closely, it appears that the movable cylinder head, b, which is fitted with packing rings to form a gas-tight junction with the walls of the cylinder, a, is held in place by means of a screw stem or rod, c, which is threaded into a yoke, d, bolted to the flanges cast on the cylinder, at f, by means of the ring, e. By turning the rod by any suitable means, the position of the head in relation to the cylinder may be altered, thus adjusting the volume of the clearance or compression space accordingly. This movement may be effected automatically in motors of the stationary type. For automobile motors, it is intended to be controlled by hand.

To secure the co-relation of the gas distribution and the compression, the regulator rod, j, is employed, which is carried by the movable cylinder head, b, and is bent around over the top of the cylinder to lie along side it, where it extends down to the region of the valve gear. Its lower end at k, is suitably shaped and formed into a rack, which engages a pinion, n, on a short length of lay shaft, which also carries the second and smaller pinion, m, which, in turn, meshes with a second rack, o, sliding in guides parallel to the axis of the crank shaft, i, arranged so that any movement of the rod, i, is communicated in proper ratio of movement to the cam, h, which is slidably mounted on its shaft. This cam is of

varying section, as shown roughly at s, so that the time of opening is controlled directly by the position of the movable cylinder head. The length of time the inlet valve, g, is held open, of course, governs the amount of charge admitted to the cylinder, and the mechanism is so contrived that as the compression space is reduced in volume, the amount of gas inducted also is reduced in such proportion as to keep the compression and hence the explosion pressures, relatively constant.

Whatever objection may be raised against the system because of the added complication of the governing mechanism, not to mention the disadvantage of the movable cylinder head, with its tendency to leakage.

SIDE VIEW, SHOWING VALVE GEAR

heating, and other attendant difficulties, the fact remains that the idea upon which it is based is distinctly novel and appealing. A motor of this type would seem able to produce a wide variation of power output without any tendency to misfiring, and with a uniformity in efficiency which has been long sought, but never attained with the more common and simple methods of design.

Causes and Effects of Overheating.

Running with too rich a mixture, too late a spark or too much throttle opening all tend to cause the same difficulty—overheating. The result in either case, must be a slow explosion, which results in a high cylinder temperature throughout the whole of the working stroke, instead of only during the first part of it, and a high exhaust temperature and pressure. The result is that the lubricant is burned from the cylinder walls before it has time to perform its proper function; that the surface of the exhaust valve becomes pitted; and that the engine tends to overheat.

PROVINCIAL BAN ON AUTOMOBILES

Barred from Prince Edward Island by Legislative Action—Bermuda also Aims to Banish Its One Car.

Exclusion of the automobile has been decreed by the provincial parliament of Prince Edward Island. A resolution to that effect has been adopted by a non-partisan vote, and it is expected that the law necessary to carry this resolution into effect will be enacted before the legislature adjourns. Only nine automobiles are owned on the island, but the number is largely increased during the summer season when many Americans resort thither to enjoy the salubrious climate and the picturesque scenery, to say nothing of the hospitality of the people who are as warm hearted as they are intelligent and progressive. Their claim to progressiveness might be disputed in view of the anti-automobile action of their legislature, but the trouble appears to be with the horses, which see automobiles so infrequently that the vehicles are productive of equine terror. Horses are more extensively used than in any other of the prov-

Prince Edward Island was the last of the maritime provinces to enter into federation with the Dominion of Canada. It nominated and obtained very substantial benefits to be conferred at the cost of the Dominion in general before it would give up any part of its independence as a province. It is an island somewhat smaller than Long Island, N. Y., and about the same shape. with a population that would make but little appreciable difference in the rush over the Brooklyn Bridge. It has, however, all the standing and public machinery of a full fledged state of the American union. Before legislative action against the automobile was taken committee hearings were given and the question was discussed in all its bearings. It was pointed out that the country was thickly settled, and the railroad system, although passing through the principal towns, did not touch at many populous and busy country districts. As trade centers in a comparatively few towns and cities, it was necessary for hundreds of farmers to drive from place to place every week.

In the last few months public meetings have been held in different parts of the province for a discussion of the automobile question, and at these meetings reports have been presented. It was shown by these reports that church attendance at some seasons of the year had decreased because the country people were afraid to drive their families to church where there was a possibility of meeting an automobile on the road. Statements showing the frequency of accidents resulting from runaways where a horse has taken fright at

an automobile, and other inconveniences alleged to have been met by those who considered themselves sufferers from the operation of automobiles led to the action of the Provincial Parliament in declaring against such vehicles.

The few automobile owners have endeavored to meet the wishes of the people so far as possible without giving up altogether the pleasure and benefit derived from their motor cars, but all efforts to reach a compromise have failed. It was at first proposed that the operation of automobiles be prohibited on Tuesdays and Fridays, market days throughout the province, but this was not accepted, and the members of the parliament decided that the total prohibition of automobiles was the only satisfactory solution.

Doubt is expressed in some quarters as to whether the Provincial Parliament has the legal right to exclude automobiles, and it is expected that after the passage of the law the question will be carried to the highest court in the Dominion for settlement.

Bermuda is a much smaller island than Prince Edward Island, but it has, like that province, its own representative government, which also is likely to put up bars against the automobile. In this case, however, any attempt to overcome the action of the local legislature would center at the Colonial Office in London, instead of at Ottawa. Bermuda is not nearly so large as Staten Island, N. Y., and its population is less than 20,000. There is one automobile there, which is used as a stage for transferring passengers between Hamilton and St. George, about 14 miles. The roads are narrow and crooked, and so it happened that one of the islanders who met the automobile while riding a spirited horse was nearly killed by the actions of the animal. This aroused a popular feeling against the automobile which is likely to lead to legislative action enabling the government to buy the stage line and abolish it.

Politeness with an Unpleasant Result.

His gallantry led Spencer Wishart, a young student at Grenwich, Conn., to the police court one day recently. Young Wishart drove over to Stamford to call upon a young lady who, after showing him her "den" said:

"Oh, Spencer, I want an "auto' license plate for my den. Won't you get me one?" "Sure," said the gallant Lothario, at the same time removing the numbered plate from his car, "take this one."

The license plate was accorded a prominent place in the "den" and Wishart proceeded to Greenwich. Before he got out of Stamford, however, a conscientious citizen noticed the absence of a number on the car, and felt it his duty to inform the police. The Greenwich gallant had to leave his car as security for his appearance in court the next morning, and the trolley carried him back to the sound village.

ANOTHER MASSACHUSETTS SQUEEZE

Legislative Committee to Report Bill Increasing Taxation of Automobiles—
Opposition to be Vigorous.

Whatever additional revenue the Commonwealth of Massachusetts can squeeze out of automobilists is to be squeezed, it would appear. The source is regarded as a juicy one, and it was to be expected that when Governor Guild in his inaugural address showed how the squeezer might be applied the suggestion would be followed up by the Great and General Court. That portion of the Governor's address was referred to a joint special committee composed of the members of the committee on taxation and of the committee on roads and bridges. The special committee met in executive session on the 31st ult., and voted to report a bill to tax automobiles according to horse power, or in other words, along the lines suggested by Governor Guil.d.

Any such bill will meet with vigorous opposition, and plans are afoot for a meeting in Boston to enable every man in the State in any way identified with automobiling to co-operate and show to the legislature that in taxing the motor car doubly, as the bill proposes, the matter strikes at every man dependent upon the cass for employment.

What makes the motorists wroth is what they term the unfairness of the whole thing. One afternoon two days before the automobile show opened in Boston, and when many of the men most interested in such a question were rushed to the limit by duties in connection with the show, the special committee of the legislature held its hearing. The automobile men claim that they never received any notification that a hearing on the question was to be given at that particular time.

The joint special committee is made up of 26 members, but less than half that number attended the hearing. Two hours were spent listening to arguments in favor of the measure, and when the few members present were tired and anxious to get away the opposition was given its chance to be heard. Because of the lateness of the hour those who spoke in opposition had to be brief-much more so than the importance of the question justified. Then the hearing was declared closed. Here was a matter in which is involved the raising of thousands of dollars, which interests thousands of people throughout the commonwealth, particularly skilled labor, closed up in less than three hours.

There were only eight members present when the vote was taken to report the bill and the vote was five for it and three against it. One-third of the joint committee acted on it.

CONFIDENCE CAMES OF A COON.

Weary of a Cook's Career, His Fancy
Turned to Automobiling—Methods
that Led to the Penitentiary.

Those Cleveland dealers who were taken in by the smooth "Willieboy" who joy-rode for several weeks until the dealers awoke to the fact that they were being hoaxed, as described in last week's Motor World, are not the only "easy marks" in the world. From far distant Spokane comes the interesting story of how the dealers there underwent a similar experience. The difference in the tales is that the glib "Willieboy" of Cleveland "got away" with his trick while the Spokane "joy rider," who proved to be a negro cook with an imagination, received a sentence in the "pen."

George Moore, alias John Scott, was a negro waiter, that is, until he got tired of "turning 'em over," and "drawing them in the dark." George had been doing this sort of thing most of his 55 years, so he hardly can be blamed for giving in when the automobile bug lit on his neck and pinched him hard. Following which George, or John, as you prefer, donned a white collar, got a shave, had his hair well oiled and combed and strolled into the Rose Automobile Co.'s garage.

"I am a planter from Alabama," said Moore, "and I am here for the purpose of buying some land. Also, I want a good machine, for I want the necessary wherewithal to blow myself proper."

An employe of the company ran out the prettiest red wagon in the stalls, applied a turkey feather duster and invited Moore to a seat.

"We sell a first-class automobile," said the chauffeur who had essayed to conduct Moore on his trip of inspection of such pieces of property in the vicinity as might be suitable for the purposes of the "planter from Alabama."

"Yes, I like this car," replied the negro, and he blew smoke from a long, black cigar as he lolled back against the leather cushions.

The driver took Moore around for more than an hour, and he looked at the different pieces of property. When the ride was finished Moore returned to the front of a popular hotel, where he said he was stopping, and the chauffeur took his machine back to the garage. He said he believed he had made a sale.

Next day Moore appeared at the Rose garage and took another ride. For this privilege he paid \$10 with a check drawn on the Old National Bank, to which he signed the name of John Scott. Within a few days he stuck all of the automobile salesmen in Spokane and nearly became breathless several times taking fast drives. He drank his fill and on several occasions

he was so far under the influence of liquor that he almost fell from his seat. However, his plan progressed and he sated himself with automobile rides.

One day, however, a check Moore had laid down came back with a slip attached to it that said he had no funds in the bank. He was arrested and spent the next 15 months in the county jail. Recently Moore was released. Within 20 days he was back at his old tricks. The automobile worm had made its way into his system for keeps. Seeking new fields in which to conquer, Moore went to Coeur d'Alene, Idaho, where he enlisted the attention of an energetic real estate man who had a few choice ranches that were eligible for a change of owners.

The agent "fell" for Moore's talk that he was a rich planter from Alabama. He got an automobile and took the big negro out to see some choice bargains. Cigars and drinks came thick and fast. Moore, to do his part, cashed several checks for \$10 and \$20. He drew some on the Old National bank and some against banks in Alabama. All got the money.

Then again came the denouement. A check was returned to Charles Morgan with the information that there were no funds to meet it. Moore had disappeared, but was apprehended and bound over to the superior court.

"Ah's gilty, youah honah," said the tall black man, smiling as Judge Tuneke asked him if he had anything to say. He smiled as Deputy Prosecutor Kizer recounted his offenses and past record.

"Were you ever in trouble before?" asked the court.

"Ah wuz a cook in de regular ahmy in Wyoming and got pinched onct wid a lot o' cowboys and regulars fer creatin' a rough house. We was let out de nex' day, though."

"I think a sentence of from one to five years in the penitentiary will teach you a lesson," said the court, and Moore sighed.

To Carry Milk to the Babies.

Although Chicago at present is wrestling with a milk strike, that is to say, the drivers of milk wagons have had some differences with their employers and Chicagoans are in consequence suffering from a milk famine, the drivers' strike will not cut off the babies' food supply. The babies will be provided for even though teamsters and drivers should join hands in the effort to force dealers to pay the increase of \$5 asked by the milk wagon drivers' union. C. A. Coey, of the Coey Automobile Co., and C. W. Foster, of the Cadillac company, announced this week that if the strike continued they would volunteer to deliver milk each day in every Chicago home where there is a baby. Automobiles will be offered to dealers to deliver milk and cream to such households. Coey promises to furnish 30 cars and Foster as many more, and by making four trips a day they say they can guarantee deliveries to 50,000 households.

CHECKS WERE GOOD FOR A RIDE

Good for Nothing Else and Martin was Arrested—Purchase of a Car the Cause of His Undoing.

There is at least one hotel proprietor in Wichita, Kan., and several other business men, who are glad that a man giving his name as A. W. Martin has been arrested in Kansas City, following the unsuccessful attempt to secure an automobile by payment of a worthless check. Martin, or whatever his name is, first got into trouble in Oklahoma City where he was arrested on complaint of the Lee Hotel. He went to Wichita and registered at the Hamilton.

After a week's residence in that city. where he made several purchases with checks which afterwards proved to be worthless, Martin tried to dodge his board bill and that of the woman who was with him by throwing his personal effects from the second story window. He then went to Kansas City where he was arrested on the charge of obtaining money under false pertenses, after issuing a check for \$4,260 against the Kansas National Bank, of Wichita, in payment for a White steam car, obtained from the Wilson garage in Kansas City. Martin went a faster gait in Kansas City than in Wichita and Oklahoma, it appears. He registered at the Baltimore and spent most of his time, it is alleged, in writing worthless checks for his numerour purchases, and in securing free automobile rides until he was brought to book by the Wilson garage.

City Gets a Car Through a "Dicker."

For the sake of making what it considered a good automobile trade, the Cleveland city council authorized the board of public service to violate the State law requiring the board to advertise for bids when any expenditure above \$500 is made. The trade consists of an exchange of two old automobiles that have been used by the city paymaster for the last three years, for a brandnew five-seated car. In addition to the old cars the board will have to pay \$1,300, getting in exchange a car listing at \$2,600. The dealer allows \$500 apiece for the old cars, and puts in the new car at \$300 below list price. The council authorized the trade by a yote of 27 to 5.

Speed Limit for the Canal Zone.

ama capal zone is prohibited in an order issued by the President. This ordinance provides that any person driving an automobile exceeding 15 miles an hour on straight road or exceeding eight miles an hour when approaching curves, forks, or cross roads, is to be punished by a fine of not less than \$5 or more than \$100, or by imprisonment for not exceeding 30 days, or both.

The Week's Patents.

878,266. Vehicle Wheel. George W. T. Akehurst, White Marsh, Md. Filed Feb. 27. 1907. Serial No. 359,542.

1. A vehicle wheel having a central chamber provided with an annular wall; a hollow hub in said chamber and having perforated side walls; bolts passing through the annular wall and also through the perforations in the side walls of the hollow hub; rollers on said bolts to contact with the circular walls of the perforations, and a cushioning means interposed between the hollow hub and the walk of the chamber.

878,411. Carburetter for Internal Combustion Engines. Ogden Minton, Brooklyn, N. Y. Filed Aug. 2, 1907. Serial No. 386,685.

1. A carburetter comprising an air inlet, a fuel supply pipe, a valve therein, and a liquid receptacle containing a supporting valve, a float secured to said valve for immersion in said liquid, and means attached to said valve, upon which the inward suction of the air may act to raise the same.

878,429. Spring for Vehicles. Richard H. Stevens, Chigwell, and Timothy Hall, Romford, England. Filed Dec. 28, 1906. Serial No. 349,911.

1. The combination of a vehicle body and axle, a metal spring, an air cushion, a telescopic casing inclosing said air-cushion and comprising two shells which are elongated in the direction of the length of the vehicle and which fits loosely one within the other at their sides, anti-friction rollers for connecting said shells and transmitting the horizantally acting tractive forces from one shell to the other, means for securing said metal spring directly to one of said shells,

THE MOTOR WORLD

and means for connecting said metal spring and said casing in their united condition between the axle and the vehicle body, substantially as described.

878,435. Induction Coil. Richard Varley, Englewood, N. J., assignor to The Autocoil Company, a Corporation of New Jersey. Filed Feb. 8, 1905. Serial No. 244,720.

1. The combination of a box having secured to its wall two metallic strips, forming part of an electric circuit, and an induction coil unit provided with means for mechanical and electrical engagement with said strips.

878,454. Apparatus for Cooling the Brakes of Motor and Road Vehicles. Jules Caillet, Paris, France, assignor to Société Anonyme des Automobiles Peugeot, Paris, France. Filed Sept. 10, 1907. Serial No. 392,126.

1. An arrangement for cooling the brakes of motor road vehicles comprising air pipes leading to the brake drums, flexible pipe sections connecting the air pipes to the drums, air holes provided on the brake drums, and means adapted to cause air to pass through the air tubes, substantially as described and for the purpose set forth.

878,467. Induction Coil System. Israel C. Orswell, Amesbury, Mass., assignor to Orswell Igniter Company. Boston, Mass., a Corporation of Maine. Original application filed Jan. 25, 1906, Serial No. 297,792. Divided and this application filed April 20, 1907. Serial No. 369,211.

1. An apparatus of the class described, having a casing, an insulating base or block therein dividing the casing into upper and lower compartments, a vibrator device mounted upon said block in the upper com-

partment, said device comprising a pair of magnet coils secured to said block, a resilient armature carrying a leaf spring having its free end above the coils and held at its other end upon a support at the side of the coils and near one end of the block, an armature secured to the under side of said spring between the same and the coils, while leaving the spring free to vibrate, a resilient contact member carrying a vibratory contact, the said member being supported upon the base adjacent its opposite end, with its free end adjacent the coils, and at the side of the electro-magnet the said contact member having an anvil device underlying the free end of the resilient armature member, a stationary contact overlying the vibratory movable contact of the resilient member and also supported upon the base or block at the side of the electro-magnet, a hammer device on the end of the armature member adapted to strike the anvil device of the contact member on the attracted movement of the armature, and an adjustable stop screw above the resilient armature member to limit its upward and return movement.

878,754. Vehicle Wheel. Alan Sullivan, Toronto, Ontario, Canada, assignor to Grahame Jones, Chicago, Ill. Filed April 17, 1907. Serial No. 368,632.

1. The combination with a non-rotative axle provided with an annular seat, of a non-rotative bearing ring surrounding said axle, an annular, resilient cushion member interposed between said seat and the said bearing ring, a wheel-hub surrounding and turning on said bearing ring, said wheel-hub being provided at its ends with annular, inwardly extending flange rings, discs attached to and extending outwardly from the axle exterior to and in overlapping relation to the said flange rings, the disc on the outer

end of the axle and the flange ring on the outer end of the hub being detachably se-cured to said axle and hub to permit the assembling and separation of the parts.

878,770. Carburetter. hill, Syracuse, N. Y. Filed March 14, 1907. Serial No. 362,265.

1. In a carburetter, the combination of a casing provided with a liquid containing chamber having a suitable source of supply, and a mixing chamber having a suitable outlet opening, a central vertical air inlet pipe extending from the bottom of the casing that the mixing chamber a conversal. ing into the mixing chamber, a sprayer affording communication between the liquid chamber and mixing chamber, and arranged above the air inlet pipe, a perforated diaphragm disposed in the mixing chamber, and a suction pipe connected to the mixing chamber at the outlet opening for the purpose set forth.

878,778. Changeable Gear Transmission Mechanism. James Dawson, Rochester, N. Y. Filed Oct. 12, 1906. Serial No. 338,532.

1. In a power transmitting mechanism, the combination with a driving shaft, a counter shaft operated thereby and a driven shaft, of a plurality of ring gears of uni-form interior diameter arranged to encircle the driven shaft and operated by the countershaft, bearings for the gears independent of the driven shaft clutch devices on the inner circumferences of said gears, a sliding clutch member secured against rotation on the driven shaft and adapted to separately engage the clutch devices on the gears to interlock the latter and the driven shaft and means for operating said sliding mem-

878,786. Speed Controlling mechamsm for Motor Vehicles. George W. Dunham, Lansing, Mich., assignor to Olds Motor Works, Lansing, Mich., a Corporation of Michigan. Filed March 18, 1907. Serial, No. 362,904.

1. A controlling mechanism for motor vehicles, comprising a hand operated rock shaft, a cam mounted thereon, a throttle actuating lever having a bearing at one end thereof upon said cam, a foot operated device for independently actuating said lever to separate the same from said cam, and yieldable means for returning said lever and pressing the same against said cam.

878.824. Carburetter for Explosion Engines. William H. Newbrough, Lansing, Mich., assignor to The "New Way" Motor Company, Lansing, Mich. Filed Sept. 12, 1907. Serial No. 392,419.

1. In a carburetter, the combination of a carburetter chamber having an air inlet at its lower end and adapted to be connected at its upper end to an explosion en-gine cylinder; a fuel delivery pipe, provided with an upwardly directed delivery opening. arranged in a horizontal position, through the wall of said carburetter chamber, such delivery pipe having a reducing plug at its outer end; a fuel supply pipe arranged in a vertical position, a valve casing connecting said fuel supply and delivery pipes; a ball check valve arranged in said valve casing; a butterfly valve arranged in said carburetter chamber below said fuel delivery pipe: a stem for said butterfly valve, arranged through the well of said carburetter chamber; a hand-piece of said stem, having a per: a nand-piece of said stem, naving a curved slot therein; a stop pivotally mounted on said valve stem, a set screw carried by said stop, arranged through said slot in said hand piece, whereby said stop may be secured in its adjusted position thereon; and a stop on said carburetter chamber, arranged to co-act with said adjustable stop of said hand piece, all co-acting for the purpose specified

878,924. External Valve Chamber. Geo. H. Woodward, San Francisco, Cal. Filed Jan. 11, 1907. Serial No. 351,895.

1. A gas engine of the two cycle type comprising a cylinder, a piston therein, said piston having a central opening in its upper end and a passage leading from one side near the top to said opening, an external valve chamber secured to the cylinder, the cylinder wall having ports connecting said value chamber with the said passage, when the piston is at or near the end of its out-ward or working stroke a valve in said valve chamber controlling said ports, a governor, means for actuating the valve from the governor, the cylinder wall and said piston having ports connecting said valve chamber with the interior of the cylinder below the piston when said piston is at or near the limit of its working stroke, said cylinder wall having on the side opposite said valve chamber an inlet port below the piston adapted to be uncovered by the piston at or near the limit of its compression stroke and an exhaust port adapted to be uncovered by the piston at or near the limit of its working stroke.

878,932. Vaporizing Device for Internal Combustion Engines. Francis W. Brady, Englewood, N. J. Filed Aug. 22, 1904. Serial No. 221.651.

1. In a vaporizer for internal combustion engines, a fuel port, means for feeding fuel through the port into the vaporizer at in-tervals, and means for creating a back-draft through the port after the fuel feed.

878,933. Fuel Feeding Mechanism for Internal Combustion Engines. Francis W. Brady, Englewood, N. J. Filed April 14, 1906. Serial No. 311,765.

1. In an internal combustion engine, a valve provided with a vaporizing surface across which the air entering the combus-tion chamber passes, a stem for said valve, a series of ducts arranged about said stem in the form of a cone, a distributing recess communicating with said ducts, and means for feeding a liquid fuel to said distributing recess under pressure and thence through the ducts onto the vaporizing surface.

878,934. Fuel Feeding Mechanism for Internal Combustion Engines. Francis W. Brady, Englewood, N. J. Filed April 14, 1906. Serial No. 311,766.

In an internal combustion engine, a valve having a vaporizing surface, a stem on said valve, an oil chamber surrounding said stem, a partition between the chamber and the stem, a plurality of ducts through said partition and spaced about said stem, and a valve in the oil chamber controlling said ducts, whereby when the valve is open oil flows from the chamber through the ducts and down the stem onto the vaporizing surface.

878.937. Spring Wheel. Samuel S. Childs, Barnardsville, N. J. Filed Feb. 15, 1907. Serial No. 357,515.

1. In a spring wheel, a resilient block, a cup on one end of the block having a marginal flange to embrace the block, means for securing the block to the felly of a wheel, a screw threaded plate, a ring sliding on the block and having an internal screw thread on one end to engage the plate, and means for attaching the plate to the rim of a vehicle.

WANTS AND FOR SALE

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

TRIUMPH GREASE THE LATEST AND BEST ON THE MARKET

WHAT IS IT LIKE?—It is the only "Spongy" Grease in the world. Its velvety consistency is just heavy enough not to run out and leak. Saves labor in cleaning machine. Will not stick or gum. Not effected by heat or cold. WHY NOT TRY IT?

You will never know its merits until vou do. Why be bothered with a smeared machine, when you can procure a lubricant that will NOT leak out, and lasts LONGER than any other? Those who are on the alert for the BEST, usually get it!

Put up in 5, 10, 25 and 50 lb. cans.

Manufactured only by the

Perfection Grease Company,

South Bend, Ind.

Just what its name implies

SPLITDORF COMMON SENSE PLUC

Made of the best material, in a'l sizes and threads—Extremely serviceable and reliable, and fulfills to perfection the purpose for which it was made.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

1909 Model Auto Parts

Axles (3 sizes), Clutches, Reaches, Buffers, Propeller Shafts, Hand Levers, etc.

We make a specialty of accurate gear cutting, hardening and grinding. Are you having any of the usual troubles? Perhaps we can help you to better things: we have helped some pretty good people lately-people who know their business pretty well, too. Perfect gears for rear axles or for transmissions don't grow on every bush. We have been "through the mill," our knowledge comes from the "lessons of adversity"; try us.

SALES DEPT.

AMERICAN DISTRIBUTING CO., American Trust Building, CLEVELAND, OHIO

One Price for Warner Auto-Meters

EVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us — it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out - that hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

A Detail of Convenience

Accessibility to every working part from above, is a notable feature in the construction of the

For example, the motor, shaft and bearings are usually reached by removing the lower half of the crank case. This necessitates the removal of the boot or mud apron under the motor, a tedious and unpleasant job.

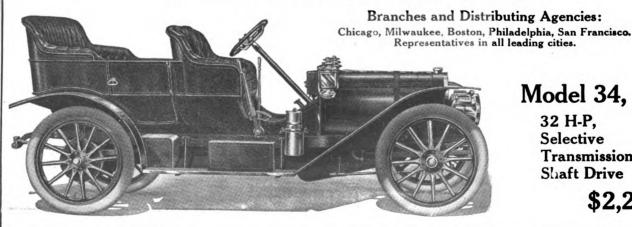

The Rambler crank case is not built that way. The entire side is removable, leaving an opening 8x23 inches that affords ample access to the entire crank shaft and cam mechanism without removal of or interference with any other part of the mechanism.

Transmission gears, differential and all other parts are equally accessible.

This is one of the little things that in the aggregate make the Rambler the leader of American cars. Our catalog tells the rest. Write for it or see our nearest representative for demonstration.

EFFECTS OF NEW YORK CARNIVAL

Beneficial in a General Way Though Unattended by Direct Results—Automobile Interests Stimulated.

Whatever its effect in respect to actual sales, there can be no doubt that New York's automobile carnival, which closed on Friday night with a smoker tendered by that superb local organization, the Automobile Club of America, accomplished wonders in the way of stimulating the spirits and energies of the men engaged in the business. A distinctly better tone pervades the entire local trade.

Practically all of the dealers and branch managers agree that the carnival had resulted in much desirable publicity and automobile interest, and was, generally speaking, a good thing, but a canvass of more than a dozen of those handling well known cars, after a lapse of several days had permitted any effervesence to subside, failed to disclose more than one who was willing to say that the festival actually had assisted in the promotion of sales.

Manager Bennett, of the White branch, stated that the victory of the White car in the hill climbing contest, which was one of the features of the carnival, had led to a number of sales, but he could trace none to the parade or the other events.

"All such affairs are of some value," he said, "but if any one can trace sales directly to their influence, I'm willing to admit that he has a better imagination than I possess."

Connecticut Claims Basic Coil Patent.

The Connecticut Telephone & Electric Co., of Meriden, Conn., have purchased of E. Q. Williams, Syracuse, N. Y., patent No. 884,116, issued on the 7th inst., and which they claim is the basic patent on the removable unit multiple coil. Williams's application was filed Dec. 28, 1904, but since that time it has been involved in an inter-

ference brought by Richard Varley, which, according to the Connecticut company, resulted in the final award of priority of invention to Williams. As a result of the purchase, the Connecticut coils hereafter will be made under the Williams patent, Williams himself retaining the right to market his own coils under arrangement with the Connecticut people, who intimate that suits several for infringement are in prospect, that type of coil being in general use.

New Company Buys Shoemaker Plant.

The much-troubled Shoemaker Automobile Co., of Elkhart, Ind., founded by the incubator manufacturer of that name, finally has ceased to exist. The trustee has sold the assets to a new corporation, the St. Joe Motor Car Co., which was formed for the purpose and which will continue the manufacture of automobiles in Elkhart. The officers are: Charles S. Conover, president; Oval G. Sellers, vice-president; Michael J. Feckler, secretary and treasurer. Scott Van Etten will be the superintendent. These men, with Charles A. Cooper, E. L. Shires and Charles LeTempt, constitute the incorporators. All of them previously were connected with the Shoemaker establishment. The capital stock of the company is \$50,000, which is said to have been fully paid in.

Splitdorf to Open Chicago Store.

Charles F. Splitdorf has completed arrangements for the opening of a Chicago branch at 319 Michigan avenue. It will be in charge of B. P. Houlihan, long identified with the Splitdorf establishment, and will, of course, carry a full stock of Splitdorf coils, plugs and other ignition specialties. The Brandenburg Bros. Co. also will establish a store at the same address.

McCord May Remove from Chicago.

McCord & Co., the well known Chicago manufacturers of lubricators and radiators, contemplate removal from the Windy City. Their representatives recently visited South Bend, Ind., where a number of factory sites were inspected.

G&J TIRE LOSES ON APPEAL

Judgment of Lower Court Affirmed—Decision Declares no Tires were Made in Accordance with Chief Patent.

Upholding the decision of Judge Buffington in the lower court and employing his language as its own, the United States Circuit Court of Appeals for the Third Circuit, has rendered judgment in favor of defendants in the case of the G & J Tire Co. vs. Pennsylvania Rubber Co., which involved the G & J patents on the clincher type of tire.

Judge Buffington's decision, which was rendered in September last, affected four patents, Nos. 454,115, 558,956, 466,565 and 523,314, none of which he ruled had been infringed. When the G & J company carried the case to the higher court, they based their appeal on patents Nos. 454,115 and 558,956. The appeal was heard by Judges Gray, Cross and Holland, the opinion sustaining the lower court being written by Judge Holland.

The gist of the decision is that the G & J Tire Co. never had made a tire in accordance with the provisions of the patents in question. The burden of the Pennsylvania Rubber Co.'s defense was, of course, that of non-infringement, although they admitted that their tire was similar to that described by the Golden patent, No. 493,160, which also was the property of the G & J company, but which had expired and become public property before they (the defendants) began the production of such tires.

Judge Holland's decision in full is as follows:

This case comes here on an appeal from a decree of the Circuit Court of the western district of Pennsylvania dismissing the bill. In the court below infringement was charged as to four patents. On this appeal two of the patents are dropped, and the two relied on were granted to Thomas B. Jeffery for inventions in vehicle tires. The infringement is charged as to claims 1. 2, 3, 4, 5 and 6 of letters patent No. 454,115, issued June 16th, 1891,

on application filed March 26th, 1891, and claims 5 and 10 of letters patent No. 558,956, issued April 28th, 1896, on application filed April 1st, 1891. In the opinion of the Circuit Court, reported in 155 Fed. Rep. 982, it was held that infringement was not proven, for which reason the bill was dismissed,

Rubber tires have been used on vehicles for a number of years, particularly upon bicycles, and at first were solid and attached to the rim of the wheel by various devices. Improvements in the art followed rapidly, both as to the construction of the tire and the mode of adjustment, so that by the time they had advanced from bicycles to automobiles, the art had progressed from the solid to the cushion, and thence to the pneumatic form. Patents were issued for each of these improvements, both as to the construction of the tire and the mode of attachment.

The oldest and most obvious form was the solid tire consisting of mere hoops or bands of rubber, with some means of attachment, such as screws or bolts. Then was introduced the tube extending through the inside of the rubber tire so as to give it more elasticity, and was called a cushion tire. In still others, this tube was filled with compressed air to still further increase the elasticity, They were and these were called pneumatic tires. attached to the rim of the wheel by bolts, diverging flanges or ears, wire bindings, and sometimes by cement. But, however, attached, and whether the tire itself was solid or cushion or pneumatic, it invariably, in this stage of the art, was completely formed and self-sustaining both before attachment to and after detachment from the wheel; and in every case the means of attachment, whether bolts, ears, wires or cement, was a mere addition to complete the tire, performing no function in resisting any strain from within the tire. Up to this time they contained no sheath, but every advance was patented, both as to construction and mode of attachment. Next was developed the tire containing a sheath, which is not made up until attached to the wheel, and in which the wheel rim and sheath together form a girdle to restrain the tube from burst-

The Dunlop was the progenitor of this class, and was patented in England March 8th, 1889, and in the United States No. 435,995 on September 9th, 1890, upon an application filed March 11th, 1890. It is referred to in the first patent in suit, to-wit, No. 454,115, descriptively as "a tire having a core composed of elastically-expansible tube, which is inflated by air or gas distended thereby to some extent, the air or gas being under such tension that but for a restraining or enclosing sheath such core would be liable to burst."

The claim in Dunlop's patent is as follows:

"In hollow air-inflated wheel tires for cycles and other vehicles, the combination, with an inner expansible tube and outer protective covering of strengthening folds or layers of cloth, canvas, or linen, and protective strips of caoutchouc interposed between the edges of the rim and strengthening fold or layer, substantially as and for the purpose herein set forth."

Besides this, there is one other patent of importance in considering the state of the art in connection with the questions at issue. This patent was issued in England to Golding on December 8th, 1890, and in the United States (No. 493,160) on March 7th, 1903, on an application which had been filed October 6th, 1891. It was for an improvement in rubber tires and rims for velocipedes and other light carriages. We find from the specifications that "The edges of the rim are bent round and brought a short distance toward each other and nearly parallel to the flat surface of the rim, thus forming an inner recess or groove along the rim on both sides, suitable for holding the projecting flanges of the The tire contained a corresponding lateral flange, which was inserted into this recess and secured by the pressure of the compressed air when the tire was inflated.

Claim 1 is as follows:

"The combination with a metallic wheel rim having lateral recesses formed by reflexing the edges, of an inflatable tire having corresponding lateral flanges which are detachably inserted into such recesses, and are secured therein by the pressure of the contained compressed air when the tire is inflated substantially as hereinbefore set forth."

The Week's Corporations.

Chicago, Ill.—Michelin Tire Co., under Illinois laws, a New Jersey corporation, with \$3.000,000 capital; to sell tires. Corporator—C. Harbridge, Chicago, Ill.

Boston, Mass.—Automobile Time Saver Repair Kit Co., under Massachusetts laws, with \$5,000 capital. Corporators—James H. Rand, James H. Rand, Jr., Boston, Mass.

Buffalo, N. Y.—Griffin Double Tread Car Wheel Co., under New York laws, with \$200,000 capital. Corporators—H. F. Griffin, W. A. Griffin, E. B. McKenna, Buffalo, N. Y.

New York City, N. Y.—Axle Cushion and Motor Co., The, under New York laws, with \$250,000 capital. Corporators, J. B. Roberts, L. B. Leavitt, H. B. Shonk, New York City, N. Y.

Elkhart, Ind.—St. Joe Motor Car Co., under Indiana laws, with \$5,000 capital. Corporators—C. S. Conover, M. S. Feckler, O. G. Sellers, E. L. Shires, Charles Le Tempt, C. A. Cooper, Scott Van Etten.

Hartford, Conn.—Nevels Mfg. Co., The, under Connecticut laws, with \$100,000 capital, to manufacture automobiles, coin controlled machines, boilers, engines and elevators. Corporators—Anthony L. Nevels. Frank J. Kňox, I. G. Cranton.

Elkhart, Ind.—Elkhart Motor Car Co., The, under Indiana laws, with \$100,000 capital, to manufacture automobiles. Corporators—Dr. Edward C. Crow, Franklin O. Hudson, Charles L. Monger, Martin E. Crow, Willard W. Sterling, Elkhart, Ind.

Inwood, N. Y.—Chandler Co., The, under New York laws, with \$30,000 capital; to manufacture chains and supplies for automobiles, motors, boats and launches. Corporators—W. A. Reinhart, H. Golden, Inwood, N. Y.; H. H. Chandler, New York City, N. Y.

In the Retail World.

Perkins & Corliss of Gloucester, Mass., have opened their garage at Manchester for the summer season.

F. W. White, a Chelsea dealer, was one of the victims of the great fire in that Massachusetts city on Sunday, 13th inst. His establishment at 44 Fourth street was destroyed.

Work has begun at Mitchell, S. D., on the construction of a building for the Mitchell Auto and Supply Co., which has just been formed and has secured agencies for several cars. The building will be two stories, 25x60 feet, with a basement of the same dimensions.

J. F. Crutchfield has been elected president and manager of the Charleston (S. C.) Motor Co., succeeding T. B. Jenkins, of Sumter, S. C., who takes the vice-presidency. E. B. Gunter, Jr., succeeds J. E. Richard as secretary and treasurer. The

company has the Reo and Premier agencies and operates a repair shop at 161 Meeting street.

George A. Kuntz. at present dealing in bicycles, feed and coal, at 1205 Twenty-fifth street, Des Moines, Iowa, is preparing to enter the automobile trade as a dealer, repair man and garage proprietor. He has begun work on a one-story building fronting 100 feet on Cottage Grove avenue, and extending back 80 feet.

The Galesburg Automobile Co. is the name of a new concern which is refitting the old Western Tool Works garage on South Prairie street, Galesburg, Ill. A. A. Addis, of Victoria, and J. E. Whitten, of Duncan, are the moving spirits. The company will sell the Glide, Jackson, and Kiblinger cars. A garage and repair shop business also will be conducted.

Construction work is to begin within a few weeks on a brick building on Hudson street, Oklahoma City, Okla., to be occupied as an automobile depository. It will be the center of distribution in the southwest for the Winfield Auto Co., of Winfield, Kan., and will be managed by C. D. and G. J. Fritz. The building will be 50 feet wide, with a solid glass front, and will extend back 100 feet. The estimated cost is \$5,000.

London Bus Interests Amalgamating.

At a meeting called for the purpose of effecting the amalgamation of the London General Omnibus Co., and the Vanguard Motorbus Co., London's two great public service companies, the chairman of the former corporation forcibly called attention to the causes which have led to a rapid succession of re-organizations and amalgamations during the tumultuous four years since the first motor omnibuses were put into regular service in the city.

"No sooner had they made their appearance," he said, "than those vultures of the commercial world—the company promoters-appeared on the scene and worked the new craze for all it was worth to them. They appealed to the public for money to float companies, and a wave of financial lunacy appeared to spread over the public at that time, and they shoveled hundreds and thousands of pounds into the shares of those companies." The efforts to reestablish the confidence which was shaken by the ill-organized ventures appear to be taking the form of a general consolidation of the more successful organizations, while the weaklings are being crowded out of existence.

San Diego Dealers Get Together.

The Automobile Dealers' Association of San Diego, Cal., has been formed with F. D. Naylor as president, L. Parker Thompson secretary, and H. N. Hanshue treasurer. It proposes to hold the first race meet on the Gay Speedway at Lakeside, Cal., in May.

POPE RECEIVERS ADD TO BALANCE

Report of March Transactions Shows Big Increase—Volume of Sales for the Month Exceeds \$200,000.

The report of Receivers Pope and Yule covering their transactions for the Pope Mfg. Co. during the month of March shows a big increase in the cash balance. The figures as filed in the Superior Court at Hartford are as follows:

Three Apples Form New Company.

Balance on hand April 1\$52,816.91

H. F. Apple, O. D. Apple and V. G. Apple have withdrawn from the Dayton Electrical Mfg. Co., Dayton, Ohio, and have gone in business in that city as the Apple Electric Co. V. G. Apple, however, still retains his interest in the Dayton Electrical Mfg. Co., and will continue to serve as its vice-president. The Apples will make storage batteries and other appliances.

Court Orders Sale of Berkshire Assets.

The court having ordered the sale of the assets of the Berkshire Motor Car Co., Pittsfield, Mass., the receiver has set April 25th as the date for the auction. Everything will be disposed of save the notes and accounts receivable.

TO RETIRE FROM SHOW BUSINESS

A. C. A. Regards Its Condescending Cooperation as no Longer Necessary— Hoyt Explains Its Attitude.

Reports that the Automobile Club of America would have no more to do with shows, which were current immediately after the Grand Central Palace show in New York last October, were given confirmation on Tuesday evening last when Colgate Hoyt, the retiring president of the organization, rendered his report. After remarking that despite the financial upheaval which was precipitated during the week of the show, a profit of \$40,000 had been earned, Mr. Hoyt advised that the club cease to participate in such affairs. The exact language of his recommendation is so condescending in tone as to be worthy of a Shattuck and for the first time will cause the men in the industry to realize how poor and weak they must have been without Mr. Shattuck's club.

"I would draw the attention of members to the fact that the Club held the first show in this country in 1900, at a time when the industry was young and needed its support and influence; that it has always stood for an open show and fair play to any manufacturer who had a legitimate product to exhibit," said Mr. Hoyt. "I am of the opinion, however, that the manufacturers are now, in their several associations, sufficiently strong to conduct their own shows without our support or assistance, and that the Club should now retire from the field and direct its energies and activities along the many other avenues of endeavor which will make for the general good of all motorists.'

When the Motor World reported that the A. C. A. contemplated action of the sort, diplomatic evasion was made; and within the past month the American Motor Car Manufacturers Association, which for three years had joined with the A. C. A. in the promotion of the "independent" show in New York, let it be known that a renewal of such relations was not impossible. The manufacturers' association now has in contemplation a traveling show to visit the leading cities.

Prest-o-Lite Plant Sent to Suburbs.

As a result of the two disastrous fires in its plant, the Prest-o-Lite Co. have had a hard time in inducing the city council of Indianapolis to grant them permission to do business within the city limits. After a long fight, however, and by a vote of 13 to 7, an ordinance was passed last week, per mitting the company to maintain a storage plant on East South street, but requiring that the producing and compressing plant he removed far out in the country district.

The Mitchell

The car you can afford to buy—and

The Mitchell appeals to you, Mr. Business Man, because it gives you just as much pleasure—just as much and as good service, is just as stylish and neatly finished as any car, and doesn't cost you a small fortune to buy—or keep.

The Mitchell at \$2000 is the standard automobile value.

Prove it-Mr. Business Man.

Get demonstrations of the extravagantly high-priced cars—and then try the Mitchell over the same route.

The Mitchell agent will be glad to take you out if you're interested for 50 or 100 miles any time you say. Call him up (it places you under no obligation)—Challenge him—

Just say, "Show Me."

He'll come around with a car and show you a "silent argument" that will get your order or he will retire without a word.

Our catalog No. 18 is fully descriptive of the Mitchell 1908 Touring Car \$2000—Limousine \$2800—Roadster \$1250 and Runabout \$1000. Write for it—we'll also send letters from users, proving the Mitchell to be the most economical car to operate.

Mitchell Motor Car Co. 281 Mitchell Street, Racine, Wis.

Member American Motor Car Mfrs. Ass'n.

Just say "Show me"

This car—shown here—35 h. p., 4 cyl., speed 50 miles, finished in Mitchell blue—price \$2000—is excellent throughout—the car you ought to have at the price you ought to pay.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

WHITE WINS FORT GEORGE HILL-CLIMB

A 30 horse-power White Steamer scored the fastest tim in the great hill-climb in New York on April 9th, making the ascent of Fort George Hill from a standing start in 32½ seconds, as compared with 36 seconds, scored by the fastest of the gasoline cars. All makes, domestic and foreign, claiming special hillclimbing ability, were represented in this contest.

The White has won so many important hillclimbs that its superiority in this style of competition is no longer questioned. The reasons for this superiority may be stated as follows:

- 1. The White engine, when called upon to do so, can probably develop more power than any other type.
- 2. It is certain that a larger percentage of the power of the engine is delivered at the rear wheels in the White than in any other machine. This was proven with mathematical exactness in the great English contest at South Harting, held for the purpose of determining this point.
- 3. The question of proper gearing for different gradients is not a vital one in the case of the White, as the car adapts itself perfectly to varying conditions. In other words, the unique flexibility of the White is of considerable advantage in hill-climbing contests, just as it is in touring or in city use.

The Matter of Special Bodies.

It is not so vary long since it was confidently predicted that the immediate future of the retail market would consist of a demand for chassis on the one hand and for bodies on the other, the two requirements being sufficiently distinct to warrant a direct ascent into the field of specalization in both cases. That the verification of this forecast is still a long way off, if indeed, it ever will come about, requires no argument by way of proof. The only practical change which has developed is in respect to the number and variety of models produced by the makers which in many instances reveal no points of difference extending below the chassis line, and in others, only such as are comparatively trivial in their nature.

A rather surprising trend which is observable this year more than ever before, however, which is quite apart from any prediction ever made, is revealed in the atti-

tude of a considerable number of buyers who pay the closest attention to the design and construction of the chassis, but manifest an astonishing amount of indifference as to the body. So long as the car is what they want, mechanically speaking, the body requirements may be briefly summarized as comprising a place to sit down and something to hold on to. It may be that more substantial bodies are generally contemplated as a later investment, it may be that the growing use of the closed car for autumn and winter running has tended to reduce the outlay which is considered expedient for purely fair weather bodies, and so for the first investment. At all events, neither the chassis alone, nor the complete car equipped with an expensive body are in any way the rule of the day.

Certainly the business in custom-made bodies has not expanded as had been expected. This is perhaps more than half accounted for by the fact that the average owner finds himself pretty much at sea when it comes to drawing the specifications for a body which exactly fits his ideal. Usually it is a great deal easier to follow in the footsteps of his neighbor who has purchased from stock, than to assert his independence by following new and untried lines.

About Mr. Hower's "Blind Run."

Thanks to his versatile press bureau, the reasons why Chairman Hower, of the A. A. A. Touring Board, personally is the beginning and the end, and all that lies between, of the Glidden touring contest, now are perfectly and deliciously clear. The chief reason is that "when the contest is under way, it is similar to the forced march of an army" and therefore requires a "commander"

Last year when a committee was in charge and when contentions arose, contestants appealed to various members thereof and as a result Mr. Hower found cause for embarrassment. Therefore, according to his press bureau, "the situation has been sanely solved" by making the chairmanship "autocratic" and fully responsible, which even his defender admits is "ethically a high handed usurpation of committee powers."

As a matter of fact, there is nothing ethical about the usurpation of power; it is very real and intensely practical. The like of it probably was never known before in the history of sport. Mr. Hower's usurpation begins long before the "army" begins its

"forced march." For he alone has power to reject entries and observers; and not merely during the "march," but afterwards and up to even the final award, he alone has the power to alter, add to, suspend or repeal the rules or any part of them. In other words, and to all intents and purposes, the only standing rule that must be followed and obeyed is Hower himself. It were better, therefore, that photographs of the gentleman himself be presented to the contestants instead of the long assortment of regulations that has been put into type. The latter mean nothing. The photograph stands for the only genuine, blown-in-thebottle rule that must be observed.

The Motor World is not insensible of the imperative necessity for undivided responsibility on occasions of the sort. Mr. Hower, however, appears to have used a magnifying glass in viewing his trials and tribulations of last year, for despite appearances, the Glidden touring contest differs little from any other contest. For every contest of whatever sort there is a referee. After the event has been organized and is ready for the road or track or field, he assumes command. The authority and responsibility belong to him alone. His duty is to enforce the rules without. fear or favor. He cannot go behind them. He cannot become a law unto himself. He cannot require contestants to do that which is not required by the rules.

When that sort of thing obtains, the contest ceases to be a contest. It becomes a "blind run"; and, without intending offense, it is fair to say that "Hower's blind run" is a more fitting designation than any other for the forthcoming Glidden touring contest, or "forced march," or whatever else it may be styled. It is all Hower. He can go behind the so-called rules whenever the whim seizes him. He is not merely superior to them; he is the Only Rule. And not even his active and efficient press bureau has attempted to answer the question: What will happen to the contest, if anything happens to Hower?

It may be true, as stated by one of its officials, that the Automobile Club of America is regarded abroad as the "national club in this country" and that it has "binding treaties with every foreign national automobile club of importance;" if it is true, the joke is on the foreigners. Everyone in America, excepting probably a Mr. Shattuck, who looks like a foreigner

and tries to act like one, and a few other persons, is well aware that the A. C. A.'s chief claim as a national organization rests in its name. It is undoubted that the club contains a number of wealthy and eminently respectable New Yorkers, one of whom manages the garage where Mr. Shattuck keeps his cars, but lately it has become better known as a place where spark plugs, axle grease and accident insurance may be purchased at cut rates.

If the various trade organizations do not hold a joint meeting and pass resolutions of thanks to the Automobile Club of America for the manner in which it has acted as the wetnurse for the industry during all these years, the tradesmen will be guilty of gross ingratitude! Of course, it will be news to many of them that the A. C. A. has been their wet nurse, but all who note the gracious condescention with which the club makes the statement in practically announcing its withdrawal from the show business cannot fail to be convinced. It is awfully nice of the club to tell the industry that it is now such a big boy that it can cast loose from mamma's apron strings.

If Chairman Hower's press bureau is anxious to indulge in further explanations, it might point out the necessity for increasing the entry fee for the Glidden contest from \$100 to \$200. As last year's affair netted a profit of \$1,100, the only apparent reason for the increase seems to be Mr. Hower's written prophecy that his committee would have a surplus of \$5,000 by the end of the present season. The "forced march" already is sufficiently expensive without "piling on the agony" for the mere sake of money-making.

In case it is decided to repert the New York automobile carnival parade in other years, it will be wise for the promoters to undeceive themselves. It will require no very extended inquiry to discover that there were very few of the tens of thousands who lined the route who had eyes for other than the relies and the decorated cars.

Those New Jerseymen who purposed fighting Frelinghuysenism to the b-i-t-t-e-r end should now get together again and sing the doxology. The carpetbag senator has had enacted a law which makes it a mis-demeanor to throw glass in the highways.

THE MOTOR WORLD

STATISTICS OF THE DENVER SHOW

Opening Attended by 3,500 Visitors—Half a Hundred Makes of Cars Staged— Big Display of Accessories.

Coloradans are long on statistics. They can almost tell one just how many and the the number of species of trees to be found in the Uncompangre national reserve or how many "lungers" locate in Denver each season. Therefore, to gain a clear comprehension of the magnitude of Denver's annual show which held forth in the Mammoth skating rink on April 6, 7, and 8, it is only necessary to quote a few figures. Numerals are impressive, anyway.

The total value of exhibits was \$335,-955.85; the value of cars on the main floor was \$260,955. Having learned this it is quite a simple process to determine the value of the accessories staged in the gallery. To find the answer subtract the smaller sum from the larger. The number of exhibitors was 55, and of this number 25 showed automobiles. To ascertain how many accessories exhibitors the same process may be repeated. The total number of cars shown was 104, comprising 51 makes. Of the total number 79 were gasolene, 22 electric and 3 steam cars. The passenger seating capacity of the cars shown was 394, while the total horsepower was 2,382, almost enough to pull Pike's Peak from its solid foundation if it could be applied in just the right way. The ground floor space amounted to 17,000 square feet, and there were 3,000 of this kind of feet in the gallery. On the opening night 3,501 persons saw the show. The decorations consisted of white pillars, dogwood blossoms and snowballs. Having detailed all these facts there remains only the list of exhibitors showing cars to append, which is as follows:

Charles Bilz, Franklin; George Hering, Stanley; Havens Auto Co., Lambert, Dorris, Atlas; Mathewson Automobile Co., Thomas-Buffalo, Thomas-Detroit, Oldsmobile and Columbus; Felker Auto Co., Stevens-Duryea and Pope-Waverly; Chicago Auto Co., Locomobile; A. T. Wilson, Kisselkar, Earl and Wayne; Studebaker Automobile Co., Studebaker; Wood & Barnett. Stoddard-Dayton; Tom Botterill, Pierce, Pope-Hartford; E. R. Cumbe, Mitchell and Rambler; Tobin Motor Car Co., Peerless and Fritchie; MacFarland-Powell Auto Co., Packard and Buick; Reo Auto Co., Reo and Premier; George E. Hannan, Jackson; Denver Motor Car Co., Great Smith and Carter; Colorado Auto Co., Cadillac; Newbold & Co., Speedwell; Colburn Auto Co., Colburn. White and Rauch & Lang; Fernald Auto Co., Inc., Maxwell; Donaldson Motor Car Co., Gaeth, Cameron and Regal; Cross & Van Hoogenhuvze, Jewell; H. A. Trinkle, Brush; Wood, Erickson & Trim-

COMING EVENTS

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

April 29, 30 and May 1, Detroit, Mich.—Detroit Automobile Dealers' Association's three days' reliability run to Saginaw, Kalamazoo and return.

May 15, Algonquin, Ill.—Chicago Motor Club's annual hill climbs on Perry and Phillips hills.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 20, Indianapolis, Ind.—Indianapolis Automobile Trade Association's 160 miles sealed bonnet endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's third annual hill climbing contest up Giant's Despair.

May 30, Baltimore, Md.—Motor Car Racing Association's race meet at Pimlico track.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

Chalmers Lets Fall Opinions.

"Heretofore automobiles have been bought; now they must be sold," is the manner in which Hugh Chalmers, president of the E. R. Thomas Detroit Co. summarizes the existing situation.

Mr. Chalmers was for years the selling expert of the National Cash Register Co.. a concern widely known for its wonderfully efficient selling organization, which Mr. Chalmers himself built up. His specialty is selling and it is natural that he should realize most keenly the demands of the automobile business from a selling standpoint.

"The country must be so districted and the selling force so organized that dealers or agents can call upon the prospective buyers quickly and frequently." he says. "These dealers must be taught the superior features of the cars they sell. And their agencies or branches must be organized to give efficient service to users at reasonable prices.

"The automobile business has got to a point where it is going to be a case of the survival of the fittest. And the fittest will be those manufacturers who not only make the best cars but also build up the best selling organization."

NEW JERSEY GOES THE LIMIT

Frelinghuysen's Ideas are Enacted—Increased Fees, No Non-Resident Privileges, and Same Speed Limit.

That more or less distinguished New York Jerseyman, Joseph S. Frelinghuysen, who serves as a Senator for the State of New Jersey, although he actually resides in New York City, has accomplished his "squeeze." When the thumbscrews are applied, it is estimated that about 250,000 fine, large dollars will fall from the pockets of automobilists into New Jersey's treasury, Frelinghuysen's amended bill has been passed by both the Senate and the House and will become operative immediately it is signed by the Governor.

According to several reports, Assemblyman Colgate had succeeded in having the speed limit increased from 20 to 30 miles an hour, but this is not the case; in fact, some legerdemain appears to have been practiced in the final shuffle as the so-called tourists' or non-residents' registration fee—50 cents for a period of six days—was dropped entirely and does not appear among the amendments that were enacted, As a result, residents and non-residents alike must pay the following fees for using what are erroneously termed the public roads:

	Registration.	License.
10 h.p	\$3	\$2
10 h n 40 20 h n		2

The higher rating will govern the fee in each instance,

The blanket registration fee of \$20 for dealers and manufacturers, has been superseded by a fee of \$5 per car.

The fee for motorcycles has been doubled—from \$1 to \$2—and henceforth they must carry a tag.

The commissioner of motor vehicles will hereafter supply the number plates which must be carried front and rear.

All registrations and licenses will expire on December 31st of each year, instead of one year from the date of issue, as at present.

For the benefit of non-resident cab companies, the new law provides that in return for a fee of \$100 they may operate as many as 15 automobiles, if they do not carry passengers for a greater distance than 15 miles into New Jersey.

The Commissioner of Motor Vehicles is authorized to employ not exceeding 10 inspectors and to provide them with motorcycles. They practically will be mounted constables. They will be paid \$3 per day. In addition, the commissioner may designate twenty citizens as "special inspectors." They will serve without pay.

The new measure will prohibit any one under 16 years of age from driving an au-

tomobile. Drivers' licenses will be of two classes. The first class certificate—fee \$2—will permit the men to operate only cars of less than 30 horsepower; the second class;—fee \$4—will permit the operation of cars of any power.

All other requirements of the existing law are retained.

When the "Human Bridge" Collapsed,

Motor cars appear to possess an irresistable attraction for, the restless souls who invent circus "stunts," and though the result of the performances which they evolve are not always as much in doubt as they appear to the audience, such is not always the case. In the course of a circus performance in Brussels, recently, a heavy touring car was being driven over a "bridge" supported by two athletes who upheld it by lying on their backs with their feet in the air. For two successive evenings the feat was performed successfully, but on the third, the driver of the car felt the bridge begin to give just as the car was well upon it. It being too late to think of backing off, he dropped into high gear and attempted to "rush it" before the crash came. In this, he was successful to the extent of charging into a box office, which happened to be , empty at the time and smashing both it and the front of the car. The "bridge" collapsed, however, before the weight of the machine had left it, and the human abutments were seriously and perhaps fatally damaged.

Two Years for St. Louis Motorists.

Automobiles in St. Louis county, Mo., must carry both the State and the city license and identification tag on their cars, in spite of the effort of Henry S. Turner to free them of this necessity. Turner applied for an injunction to restrain Louis Alt, license commissioner, from compelling him to affix the city tag. His contention was that the State law specifically asserted: "Said owner shall not be required to place any other mark of identification upon his vehicle." Judge Rule denied Turner the injunction sought, declaring that the provision cited referred only to State marks of identity and not to any provisions that city may have made. He ruled that the city council could compel the display of a city tag in spite of the provision of the State law.

Dates Fixed for Detroit's Contest.

The Detroit Automobile Dealers' Association will hold its annual three days' reliability run on April 29, 30 and May 1. The first day's run will be to Saginaw and the second day to Kalamazoo. The last day's journey will be back to Detroit, a total distance of 412 miles. The cars will be placed in one class, the only stipulation being that they must be of standard classification. Penalties will be, imposed for time spent in repairs and for being late at controls.

ALASKAN ROUTE IS ABANDONED

American Entry Finds It Impossible—Returning from Valdez and Will Follow
Others to Siberia.

No race ever developed a more complicated or perplexing situation than now exists in the New York to Paris scramble. Finding the Alaskan trails from 10 to 15 feet deep in soft snow and not even as wide as the car, the Thomas party, the only American members of the expedition, and the leaders up to this point, were obliged to turn back after a stay of a little over one day at Valdez. News of this reached the Italian and French contingents Tuesday of this week, on their arrival at Seattle, and with common consent they turned about and took the first boat leaving for Yokohama. From that point, they will cross Japan to Tsuruga, a distance of 200 miles and more, and ship their cars to Vladivostok.

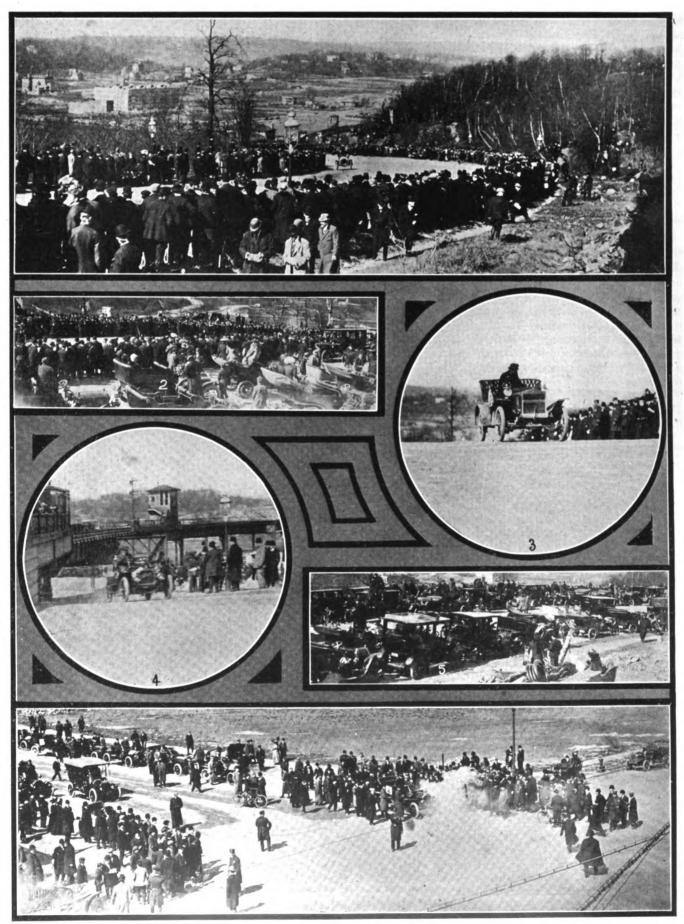

The Thomas car, which is expected to reach Seattle to-morrow, on its return from the north, will be shipped to Vladivostok direct, on Saturday. Allowing for delays in Japan, the two parties probably will reach Vladivostok at about the same time.

Should the Italians reach the starting point ahead of the American party, it is stated they will be ordered to await their arrival according to the terms of an agreement entered into by representatives of the respective companies while the Thomas car will still in San Francisco. Even so, the Thomas car will have lost its two weeks' lead, and will start on foreign soil on even terms with the others. It will thus stand a chance to win the race for the third time as the Thomas people explain. They say:

"It has already defeated the entire field by a sufficient margin to prove finally and conclusively that it is the best car for American road conditions and American road travel. Secondly, it has won the race according to the original rules, by going farther over the original course than any of the other competitors. It now remains for the Thomas, starting on an even footing with the foreigners on foreign soil, to demonstrate its superiority over these cars on their soil as conclusively as it did in its own country."

The oft-repaired German Protos car made another start from the Union Pacific railroad repair shops at Odgen, and headed over the road for Seattle, last week, but broke down after proceeding as far as Pocatello, Idaho, and was shipped to its destination on a flat car. It is announced that it will go to Siberia with the Thomas car, and continue the race as a "non-contestant," but as later reports say that Lieutenant Koeppen, its conductor, has dissipated his entire personal fortune on the venture, who will "pay the freight" appears uncertain,

THE MOTOR WORLD SCENES AT THE FORT GEORGE HILL CLIMBING CONTEST.

1—General View of the Hill and the Crowd. 2—Spectators Massed Beside the Course. 3—Charles Fleming (Maxwell), Winning in His Class. 4—The Narrow Pass Under the Elevated Railway. 5—Automobiles Parked on the Hill. 6—General View at Starting Point.

CARNIVAL SPORT AT FORT GEORGE

Biggest Hill Climb Ever Viewed by Thousands—White Finishes both First and Second in Free-for-All.

The "King" and the "Queen" having had their brief reign, the next brilliant page in the history of New York's automobile carnival last week was turned on Thursday, 9th inst., when the hill climb up the Fort George incline took place. In point of competitors it was the biggest hill climb that has yet been held in America, no less than 71 cars being sent up the 1900-fect, 10 per cent, grade in less than

cylinder cars costing more than \$4,000 in 3844 seconds. Two features of the meet were the even distribution of honors, and the close times in all events. J. W. Swan, Corbin, and William Bourque fought a real battle in two classes, both going to the former by narrow margins. Charles Fleming. Maxwell; Ward Olney, Mitchell; Robert Burman, Jackson, and P. J. Robinson and Guy Vaughn were among the other prize winners, while H. E. Wagner beat Robert Clyde by nearly half a minute in the electric class. Each rode in a Babcock electric and the big crowd cheered when both pulled up the hill in good time. Charles Lane, White, had a walkover in the steam car class.

A more picturesque spot than Fort

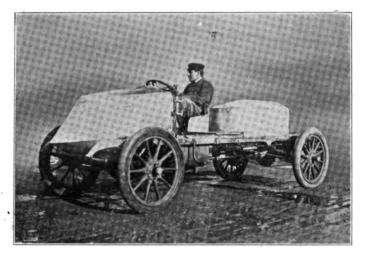

veal a dozen sales. Even the youngster who sweetly called out "sowveneer" hats, and advertised his wares by wearing two—one red, the other green—at diverging angles on his head, was disheartened. One peanut vendor almost had to be restrained from casting himself before the oncoming juggernauts.

"Jees, vat a crowd!" he exclaimed disconsolately, "no vun vants to eat peenits today."

It would not be fair to pass without notice of the cripple who mechanically rolled tumblers back and forth on a board and assured all who stopped to listen that he had the only "real hill climbers," although his tumblers only rolled one way—down hill.

J. W. SWAN (CORBIN), TWO TIME WINNER

WALTER C. WHITE (WHITE), WINNER OF FREE-FOR-ALL

two hours. With a squad of mounted police at the foot of the grade and a score or more of ordinary "cops" lined along both sides of the Belgian block course, the competing drivers had no fear at any time that they might charge into any of the 10,000 or more spectators that witnessed the short flights. The Belgian blocks were somewhat "cobbly" and without intending a pun, it follows that the steering wheels were decidedly "wobbly" as the cars bumped over the rough surface. There was no confusion at any time and the instant one car was reported at the finish line, another was immediately dispatched from the start, the finishing cars returning to the base of the hill by a back route.

The fastest flight of the day was made by Walter C. White, of Cleveland, when in the free-for-all he flew up the slope in his odd looking White steamer in 32½ seconds, an average of 40.2 miles an hour. White has the unusual distinction of paradoxically finishing first and second in the same event. He entered two cars and in the second one White scored the second best time in the same event, the second flight requiring ½ second more than its predecessor. The fastest time in the stock car events was scored by P. J. Robinson, Stevens-Duryea, who won the class for six

George hill for a hill climbing contest cannot be found around New York. The only thing that mars its beauty is the sight of prosaic apartment houses in the distance and the prevalence of theatrical and real estate bill boards on the hill itself. For this reason the peep of the Hudson river through two massive hills off to the north loses its value as a scenic delight. The day was perfect, excepting for the strong breeze that made more than one unfortunate wish he hadn't put his winter overcoat under the protection of moth balls at the sign of triple balls. The only persons who did not seem to mind the wind were several Postal messenger boys who carried on a game of ball in a lot at the bottom of the hill, and the entire Junior class of New York University. The students were enjoying a three days' suspension for having ducked a fellow student in the college fountain, and the hill climb occurred at the right time for them. The only absent one was the student who had been hazed.

It was unmistakably demonstrated that a New York gathering is not a souvenir crowd. Anticipating a thriving business, all the button men had laid in a big supply of dinky little "carnival buttons" and flags. A hasty survey of the crowd failed to re-

It was a bad day for business of this sort. The crowd was not buying. It was a free show, so what was the use of spending one's money recklessly? Seeing that the crowd didn't "bite," the fakirs, like Arabs, silently stole away before the last two events, with determination on their faces to make up the financial loss at the next Richmond county fair.

All the nurse girls from the Inwood and Spuyten Duyvil districts, not forgetting one white-aproned servant who came all the way from the "Bron-nix," were there. The last named caused some excitement when Walter White made his spectacular flight. The nurse girl was so eager to get a view of the racer that she quite forgot her charge, and perambulator and Napoleon Newlywed started to emulate White by racing down the hill, it being easier going than would have been the opposite direction, and besides it was pointed that way. A convenient rock stopped the perambulator fifty feet from where it had started and besides a frightened cry, that was a cross between a wail and a whoop, Napoleon was unhurt. The maid was more frightened than anyone else.

This was the only near-casualty of the afternoon, which is remarkable. Fort George hill itself is wide enough to pre-

clude any possibility of accident on its wide curves, but to get upon the hill proper the cars had to pass through a needle's eye at the bottom where the overhead subway entrance makes the road at that particular point just about wide enough for a car to squeeze through and nothing to spare. The fact that all the events were from a standing start reduced the danger at this point to the lowest possible minimum, and it is to the credit of the drivers' trained eyes that not one miscalculated the width of the "squeeze."

The hill presented an animated appearance. All the competing cars were parked in the streets at its base, together with several hundred pleasure vehicles, while that many more afforded grandstands at the summit. The hill on both sides of

spicuous in every event of importance for the last three years. White has other clothes but this is the outfit he always dons when he has a victory in mind. Thus far they have proved a pretty good mascot.

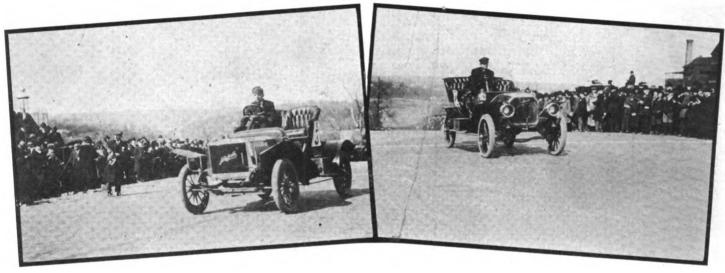

The meet got its start when two Maxwells, driven respectively by Charles Fleming and J. Ross, competed in the class for gasolene cars costing \$850 and under. Fleming beat his stable mate by some seconds in 1:193%. Ward Oldney, Mitchell, had his innings in the next round for cars costing between \$851 and \$1,250. The electrical timing apparatus which, by the way did not once go out of commission, gave him 1:071%. R. L. Lockwood, Reo, and Thomas Forbes, Overland, tied for second place in 1:141%. This was the first time the Overland has competed in the

took four-fifths of a second longer to finish. Leonard Zengle, Pennsylvania, and J. P. Grady, in another Pope-Hartford, ran a dead heat for fifth place, each being timed in 49 seconds.

Swan and Bourque had another battle royal in the open class at the same price limitations, the former winning by 23/5 seconds in 42/5. Barbour, Corbin, was third, and F. Cimiotti, Pullman, fourth.

The class for four cylinder cars costing more than \$4,000 looked like a family party, as nine of the competing cars wore the same name plate. Guy Vaughn won in 421/4.

The free-for-all brought out the "big ones" and as the cars in this event did not have to conform to catalogue specifications, and could strip if their drivers desired, it

WARD OLNEY (MITCHELL) AND ROBERT BURMAN (JACKSON). COMING TRIUMPHANT OVER THE BROW OF THE HILL

the street was lined with spectators three or four deep, while all the high rocks overtopping the east side of the street, above which the Fort George pleasure grounds rise "moneymakingly," held living lichens. Near the top of the hill, in sight of the finish line, was a natural amphitheatre which held several thousand people, and which resembled the bleachers at a league ball game in mid-summer.

About 200 White rooters stormed the highest and biggest rock half way up, and from their lofty citadel kept the crowd informed that the White was going to shove Father Time into the Atlantic ocean, Hoboken or some other place. The White company had distributed several thousand aluminum "noisy snapper jacks" and the crowd worked over time to get a putty-put-put-puty-put-put sound from them. When the several thousand went off at once, the battle of Port Arthur must have been a Quaker first day meeting in comparison.

There was no need to consult programs when White finally did shoot up the hill in a cloud of steam. His half-smile is almost historic, and besides he wore the same Norfolk jacket, corduroy "knickers" and leather cap that have made him con-

cast. Robert Burman, Jackson, who finished last in that class, made the best time in the event for cars between \$1,251 and \$2,000. The apparatus gave him 523/5 seconds, and Harry B. Tucker, Corbin, gave him a close "rub" by reaching the top in 554/5. Chris White, Aerocar, was third.

P. J. Robinson took the next two events—for gasolene cars between \$3,001 and \$4,000, and for six cylinder cars costing more than \$4,000. In the former event he was timed in 45 seconds flat, with Frank McCaffrey, Cleveland, the runner-up, in 553/5, and in the sixes' picnic he drove a 50 horsepower car in the fast time of 384/5. Guy Vaughn was second.

The biggest event of the meet, which brought out 15 starters, was the class for gasolene cars costing between \$2,001 and \$3,000. It produced the finest competition, so far as hill climbing sport goes, as all the cars, with one exception, scored under a minute. It went to J. W. Swan, Corbin, who made a clever ascent in 43½ seconds, with William Bourque, Knox, a close second in 46½. J. P. Grady, a veteran hill climber, was timed at 47 seconds flat in his Pope-Hartford, while the next best was Charles Miller, Stoddard-Dayton, who

was natural that fast times should result. Walter White drove the same car that made the fastest times at the Wilkes-Barre and the Cleveland climbs last year. Later he steered another stripped White in the same event, and came within one-fifth of a second of the record of 32½ seconds, which he made with his racy looking car. Emanual Cedrino, with a 60 Fiat Cyclone racer, was third in 37, and P. J. Robinson was fourth. Edgar Apperson, Apperson, was timed in 38 seconds, and John B. Ryall, in his big Matheson finished sixth. The summaries:

Another Climb up Giant's Despair.

The differences between the Wilkes-Barre Automobile Club and Walter White and D. Walter Harper, over the hill climb last year, having been satisfactorily settled, the energetic Diamond City club has announced that it will again hold a hill climbing contest up the now famous Giant's Despair mountain, just outside that city, on Decoration Day, May 30th. The club refused to allow steam cars to compete in the free-for-all event last year and Harper and White both protested to the American Automobile Association and were sustained. The Wilkes-Barre Club has since made a satisfactory settlement and the climb will be repeated this year.

As they did not wish to have the date of their hill climbing contest conflict with similar events in other cities, the promoters of the Cleveland hill climb have postponed their contest from Memorial Day to June IV. The annual meeting of the Ohio State Automobile Association has been set for the same bay as the hill climbing contest.

GARY HEADS MR. SHATTUCK'S CLUB

Other Regular Nominees Elected Without Opposition—Retiring President Showers Boquets on the Organization.

With Judge E. H. Gary as president, the regular ticket submitted to the members of the Automobile Club of America, at their annual meeting on Tuesday last, 14th inst., went through like a dose of oil. Judge Gary's colleague's are: Vice-president, Henry Sanderson; 2nd vice-president, William G. McAdoo; 3d vice-president, Robert Lee Morrell; treasurer, Edgar L. Marston; one governor for one year. Horace Porter: three governors for three years, Waldron Williams, Frederick D. Underwood, William Pierson Hamilton; governors for four years, Cornelius Vanderbilt, Schuyler Skaats Wheeler, Colgate Hoyt. Members of the board of governors who hold, over are John Jacob Astor and George F. Chamberlin, of the Class of 1909, and Dave Hennen Morris, Albert R. Shattuck and Winthrop E. Scarritt, of the Class of 1910.

From the outside standpoint the report of Colgate Hoyt, the retiring president, was of more than usual interest because it not only recommended withdrawal from participation in show promotion but also because it touched on the cause of the withdrawal of the club from the American Automobile Association. Throughout the entire report there is a clearly defined disposition to make the club appear as a national organization, which, of course, it is not. In dealing with the subject Mr. Hoyt says:

"Our club is the only automobile club in America recognized in automobile circles in any foreign country, and it is everywhere regarded as the national club in this country and has binding treaties with every foreign national club of importance."

Althought he club withdrew from the A. A. A. because Mr. Shattuck thought automobilists should pay a registration fee of about \$40 per year and he and Lawyer Niles and a few others believed that a man's right to use the public roads should be made revokable, President Hoyt, or whoever compiled his report, has the sublime and unsalted courage to try to claim some credit for the new bill now pending in the New York legislature. The elimination of the "miles per hour clause" gives him great pleasure.

Among recommendations contained in the report is one for an "international touring car trial, somewhat on the lines of the trial to be held by the Royal Automobile Club of Great Britain." Also that the club should organize a congress of automobile clubs and road commissioners from different states to promote a national automobile law, uniform state legislation, continuous inter-state highways and to conduct

experiments "to determine the best preservatives for road surfaces and the abatement of the dust nuisance."

The report recommends that the club should annually donate a medal, to be awarded to the police officer of New York City "who, in attempting to protect the public's safety, exhibits the greatest bravery and risk to himself."

With a gentle hand, Mr. Hoyt administers a slap to the A. A. A. and an approving pat on the back to the A. C. A. in the paragraph which treats of the Federal bill which "our club" did not endorse as it was "in the opinion of eminent counsel, unconstitutional in its provisions. The subsequent rejection of the bill by the House Committee on the Judiciary on the ground of its unconstitutionality justifies the wisdom of your law committee"—which is largely Niles.

Among the "numerous activities" of the club were the labors of the committee on public safety which distributed to automobilists and to the press more than 200,000 copies of a report urging strict observance of traffic regulations and referring to the use of the horn, acetylene lights, smoky exhausts and speed limits.

The club now has 1,540 members, a net gain of 229 during the past year.

New York Buying New Cars.

Two new automobiles have been added to the equipment of the New York police department. One of these was purchased after bids had been submitted on specifications drawn up by the city's engineering department, the successful car being a Stevens-Duryea. Although the catalog specifications of this make of car are not in accord with the specifications issued by the police department, the manufacturers made the necessary changes which principally were in the composition of the metals used in the axles and crank shaft.

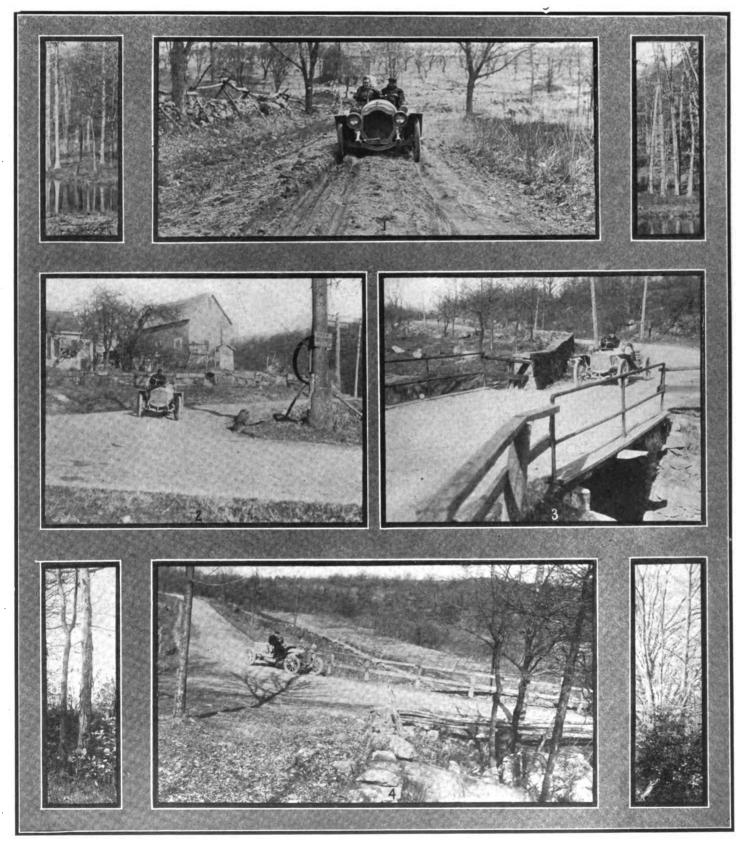

After the Board of Aldermen had refused permission to Commissioner Bingham to purchase two cars in the open market. without advertising for bids, they partly reversed their own decision by again taking up the subject and granting permission for one car to be bought in this way. As the car was for the use of the first deputy commissioner, the selection was left to him and he chose a Berliet.

It is reported that the Department of Docks and Ferries shortly will advertise for a car. The specifications will be the same as those used by the police department.

Two Hills for Chicago's Club.

May 15th will be the date of the Chicago Motor Club's annual hill climb up the Perry and Phillips mounds at Algonquin, Ill. Twelve events in all have been provided, separated into four divisions, including two amateur events and a team competition, in which latter event the three cars making the best average by club for mula will be declared the winner.

SOME OF THE DANGER SPOTS ON THE BRIARCLIFF COURSE.

1-Muddy Road Near Pines Ridge. 2-One of the "Hairpin" Turns. 3--Sharp Turn on to a Country Bridge.
4-Winding Road Down Hill to a Right Angled Turn.

STARTING ORDER AT BRIARCLIFF

Twenty-two Entrants Draw Positions The Men Who Will Flirt with Death on the Corkscrew Course.

Unless God is unusually good to the Automobile Manufacturers' Committee and to the contestants themselves, the story of the race for the Briarcliff trophy, which occurs on Friday of next week, 24th inst., will be one of the saddest stories of the sport ever penned. As the Motor World has stated on previous occasions, the course in Westchester county, New York, which has been selected for the contest, is

10 Murphy, 30 Maja. 11 Poole, 50 Isotta-Fraschini. 12 Roberts, 60 Thomas. 13 Oldfield, 30 Stearns. 14 Bernin, 50 Renault. 15 Robertson, 50 Panhard. 16 Hilliard, 30 Hol-Tan.

17 Campbell, 30 Allen-Kingston. 18 Bloch, 50 Renault.

19 Harding, 50 Isotta-Fraschini. 20 Bergdoll, 50 Benz. 21 Seymour, 50 Simplex. 22 Watson, 50 Simplex.

It has not yet been announced at what interval the cars will start on the morning of the race. In fact, some of the details

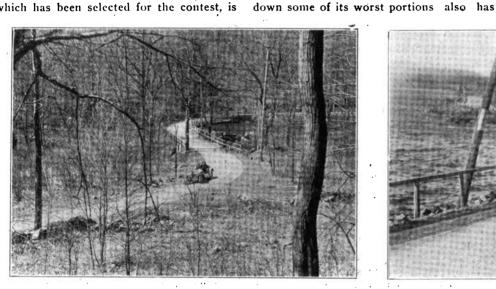

seem to be somewhat clouded. Work on

the grandstand was started only this week

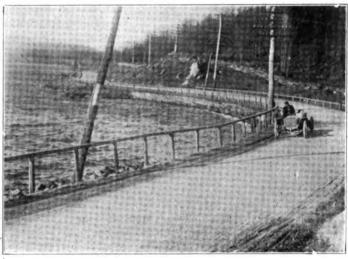

and the task of oiling the course and toning

Although all the drivers entered for the race have not yet "felt" the course in their racing stock cars, preferring to wait until the roads are made at least semi-safe, a number of them have taken chances by daily early morning spins around the corkscrew circuit. The ditching of cars has been almost a daily occurrence. Montague Roberts, Thomas, was one of

the first to damage his car. The accident to Roberts's car occurred on Friday morning last, and fortunately for him and his mechanic neither was injured, but since that time Roberts has been using another car in his practice runs. Roberts attempted to take the sharp curve just below the site of the grandstant at Briarcliff Manor too fast after passing another car, and a skid into

ONE OF THE MANY CORKSCREW TURNS

SERPENTINE ROAD ALONG KENSICO LAKE

as full of tragic invitations as a porcupine's back is full of quills. Indeed, "prepare to meet thy God!" is the warning painted by some religious crank on a boulder, that marks one of the many sharp, right-angled turns which stud the course that is just a little straighter than a corkscrew; and it is a warning wholly appropriate to the forthcoming occasion.

If the plans, so far as they are known at present, are carried out, twenty-two drivers in that many cars will start, beginning at 4:45 a. m. on the 24th inst., for a ten laps' race around the dangerous course. As it measures 30 miles the full distance of the race will be 300 miles.

Positions for the start were drawn by representatives of the contestants on Tuesday of this week and Prossen, who is to drive a Bianchi, secured the right to start first by drawing "No. 1." Cedrino will start second in the Fiat. The official order of start is as follows:

- 1 Prossen, 50 Bianchi.
- 2 Cedrino, 60 Fiat.
 3 Lytle, 50 Apperson.
 4 Strang, 50 Isotta-Fraschini.
 5 Leland, 30 Stearns.
 6 Parker, 60 Fiat.
- 7 Michener, 45 Lozier. 8 Vaughn, 30 Stearns. 9 Mulford, 45 Lozier.

only begun. No announcement has been

made as to how the promoters intend to

police the course, although a rumor is

afloat that several regiments have been "in-

OF BRIARCLIFF COURSE

vited" to keep in order the throng of spectators that probably will flock to Westchester county to witness the contest.

an embankment was the result. Monday, the 13th, proved an unlucky day for Joseph Seymour, who is to drive one of the Simplex cars. Seymour left the narrow road in the Mount Kisco section and crashed into a stone wall. The car was damaged somewhat, but the driver and passengers escaped injury. Daniel Murphy came to grief near the Kensico reservoir Tuesday morning. He also attempted to rush a turn in his Maja car and it turned turtle. Murphy received a bad gash in his leg, but will be able to walk in a day or so. Accidents to touring cars are of such common occurrence as to excite no comment. There is scarcely a mile of absolute straightaway in the entire thirty miles, so it is plain to see that the possibilities for undesirable sensations are immense.

Not any portion of the course can be described as safe, but some of the turns are positively dangerous. There is a bad turn just below the grandstand at Briarcliff and another where the course zigzags around Hawthorn. A few hills are encountered before Valhalla. Probably the best portion of the course is from Valhalla to Armunk, until Mount Kisco is reached. From Mount Kisco to Pines Ridge it is described as "fierce," while the stretch

UNEVEN ENFORCEMENT OF LAW

from Eastview to Valhalla is just as bad. On both these legs the road has been so badly cut up, and abounds in so many ruts, that it will be a gigantic task to make the road half-way safe before the day of the race.

If all the cars that have been nominated start, the race cannot but develop into the longest one of its kind ever held. The fastest time recorded in the trial spins has been 45 minutes for one lap, thirty miles, and the majority of the cars that have been timed have done not much under one hour. In view of this it would seem that the race will run for at least eight or nine hours. As the road is so narrow in places that it is practically impossible to pass another car while going at full speed, the cars that get an early start doubtless will have the best of the odds.

Eleven American and the same number of foreign cars will be represented. The Bianchi, Fiat and Isotta-Fraschini are of Italian origin; the Benz, of German, and the Maja is of Austrian manufacture. The Renault and Panhard are French cars. The American makes represented are the Lozier, Stearns, Thomas, Hol-Tan, Simplex, Apperson and Allen-Kingston. As a contest between fate and skill the Briarcliff trophy race should prove an exciting example. The most skilled drivers in America will flirt with death, such well known cracks as Lytle, Leland, Strang, Oldfield, Michener, Vaughn, Poole, Roberts, Bernin, Robertson, Hilliard, Campbell, Bergdoll and Harding being included in the list. Some of them have families.

Colgate Hoyt has been named as referee and A. R. Pardington associate referee.

Turkey's Aversion Begins to Weaken.

It would appear that Turkey's constitutional aversion to the motor vehicle is in a fair way to be overcome. According to a report from Consul William C. Magelssen, of Bagdad, a commission from Constantinople, headed by Nazim Pasha, which has been investigating economic conditions in Mesopotamia, has recommended the establishment of three automobile routes leading from that city. These will open regular communication with Damascus, Aleppo and Mosul, respectively. The recommendation is now receiving attention, he continues, and it is believed that the plans will be carried out. He states that it is likely that heavy vehicles seating at least six passengers will be required.

Motor Bus Service for City of Mexico.

One, of the first installment of five motor omnibuses, is about to be put into service in the City of Mexico by a local company which has been organized for the purpose. The remainder of the lot will follow in a short time. The machines have been ordered from an English firm which is building the equipment of one of the London companies, and are of the single deck type, seating 24 passengers.

Why the Chauffeur has a Grouch—Compelled to Obey Road Rules that Horse
Drivers Persistently Ignore.

"I don't want to be known as a man with a perpetual grouch," said a professional chauffeur, whose driving mainly is done through the streets of New York City, and its suburbs, "but I've had a grievance for so long that I am beginning to think it may become permanent, unless something is done to remove the cause of it.

"We've all heard so much about 'unjust discrimination' against automobiles and automobile owners that the phrase has become tiresome, but usually the 'discrimination' that is talked about, is in reference to laws and legislation, license fees, speed rules, etc. Yet there is another feature, or may be the same one in slightly different guise that roils me, and that is the one about road rules, or, as we say here, street traffic regulations.

"Consider first the automobilist: If he drives a little faster than the law allows, he gets pinched; if he goes downtown on the uptown side of the street, he is pinched again; if, through accident or design he neglects to obey a policeman's signal, he has either to back up, turn around or get pinched; in other words, he has to be mighty good all the time and obey all the rules, or he is in constant trouble with the authorities. Understand, I am making no complaint about these things; I am entirely willing to obey all the laws made to govern traffic, but I think that the traffic laws should be impartially enforced, and that horse drawn vehicles should be compelled to obey as well as automobiles.

"While horse drawn vehicles are compelled to live up to the regulations that I have quoted, they are permitted absolutely to ignore one rule that, in itself, does not affect the automobilist very much, though the fact that others are permitted to ignore it frequently places the automobilist in a serious predicament; that is the rule which seeks to compel slow moving vehicles to keep to the right.

"Any driver of a motor car can recall numerous occasions when collisions have been narrowly avoided, or perhaps actually did occur, because his only way to pass a load of hay, a moving van or some other heavily loaded, slow moving vehicle, traveling in the same direction, lay in going to the right of it instead of passing it on the left as the regulations provide. There is no earthly reason why these vehicles should not be driven on the right side of the street, and there is absolutely no reason why the police should not compel them to do so, but the cops do not compel it; and that constitutes the discrimination that is causing my grouch.

"Fourth avenue in Brooklyn, is a good illustration of the point I make. Although this street is boulevarded and has a roadway about 25 feet wide on either side of a 10-foot neutral ground, it is not popular with automobilists. The street is asphalted and leads to the macadam roads which go to the Crescent Club's country house, and the U.S. military reservation at Fort Hamilton. Fourth avenue is also the direct road to one of the most beautiful driveways in the world. The 'Shore Road,' and yet the avenue is used very little in the day time by automobilists simply because the police, who are detailed for the purpose, fail to enforce the traffic regulations, with the result that when a motor car does use the streets its course resembles that of a ship without a rudder. No other good roads are near at hand, and the motorist must go a mile or more out of his way to reach the same points, but invariably he prefers to take the longer course, rather than to try to navigate through a street which should be and could easily be made a safe and delightful thoroughfare.

"Some time ago I learned that officers of the Long Island Automobile Club had taken up the matter and tried to have the rules of the road enforced. I spoke to one of the bicycle policemen who are stationed on the avenue, asking him why he didn't arrest the drivers who wouldn't obey the law.

"'Arrest them,' he said, 'We did arrest them—took in 18 in one day and the magistrate discharged every one of them and then called us down for interfering with poor working men, as they expressed it, and letting rich automobilists do as they please; so what's the use of taking them in if the judges will not support us?"

"There's the unjust discrimination. Because a man is a working man, he's poor, and must be let alone; if he rides in an automobile, he's rich, lock him up. And yet this is a country where all men are supposed to be equal!"

Cabbies Make War on Automobiles.

With the influx of Easter visitors to Atlantic City the annual war between cabbies at the railroad stations has begun. Charged with malicious mischief, Herbert Kiger. driver of an uptown hotel automobile, was held last week under \$500 bonds for court. upon complaint of Earl Farr, another hotel automobile driver. According to the stories told Magistrate De Hart the men have been having some argument about their respective places in the line of waiting vehicles on the arrival of a train. Kiger is alleged to have told Farr that he would get even with him. The trouble came to a focus when Farr is said to have deliberately charged into Farr's car with the machine he was driving, resulting in the demolishment of the former's machine. Two women who were in the car were nearly frightened to death. Then followed the arrest of Kiger.

NEW IDEA IN STANDARDIZATION

Special Feature in Mechanism of the P. & S.

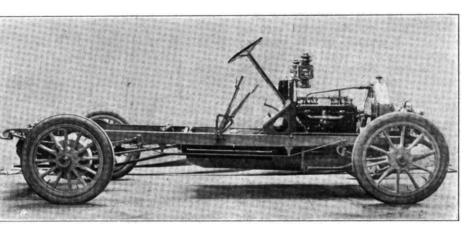

Product—Details of Design and

Construction.

Considerable meaning may be conveyed by no more than two letters on occasion, though ordinarily a good many more are required to convey a definite idea. A case in point is the cryptic "P & S" which is the appellation given to New York City's latest motor car product, marketed by Palmer & Singer. In this instance the significance attached to the letters is that of a sturdy and thoroughly practical machine in which are embodied a sufficient number of original features to give it ample distinction

quarters without lowering the chassis unnecessarily.

The chassis of the Four-Forty model. which for the first time was put on exhibition at the warerooms of the company last week, reveals these characteristics: Motor, vertical, with cylinders cast in pairs and measuring 5 by 5 inches bore and stroke; with valves mounted in pockets on the right side, thus grouping all auxiliaries and possible adjustments, except the magneto, on the drivers' side and necessitating the lifting of only one side of the bonnet when making inspection and light repairs; double ignition, with two sets of plugs and Bosch magneto; engine control by levers on steering column and accellerator pedal. Transmmission is effected by means of a four-speed, selective gearset affording direct connection on the

CHASSIS OF P. & S. "FOUR-FORTY"

above other products measuring up to it either in power or price.

The P & S line is composed of five distinct vehicles, mounted on four different chassis, making a line complete in itself. Though widely varying in purpose and size, an ingenious application of the designer's art has made the mechanism practically interchangeable back of the dash boards, so that transmission and running ge: r parts for the whole line may be stocked without complication, and replacements made with a minimum of inconvenience, both to owner and repairman.

The models are known respectively as the "Four-Forty," "Town and Country car," "Six-Sixty Touring Runabout," "Six-Fifty Runabout," and "Skimabout." Except for the engines, and other items relating to wheel base, location of power plant, and arrangement in other respects, the cars are much alike, as already indicated, so that a study of one involves in a general way a study of the others. One point of difference, however, applying both to the Town and Country model and to the Skimabout, is in the radiator and bonnet construction which in these two instances follows the C. G. V. pattern. The Town and Country car, which is a neat and comely landaulet, also is marked by a double-drop frame, which provides easy access to the passenger third speed, and double-jointed shaft to the live rear axle. The master clutch is enclosed in the gear case and is of the popular multiple disc pattern, employing 49 members and affording an unusually large amount of working area. The wheel base is 126 inches, the tires 36 by 4 by 4½ inches.

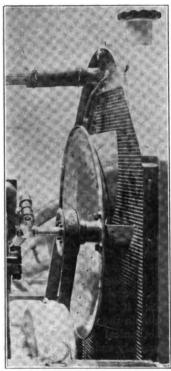

Of the features which are worthy of special attention may be mentioned among others the springs, which are all of semi-elliptical pattern, of 34 and 52 inches length, front and rear, respectively, and having 13 and 14 leaves respectively. All but the upper leaf in each case are provided with "kitten ears," to prevent disalignment, the upper leaves being of short length and destined to absorb only the rebound. The rear shackles of the front springs are also provided with non-reversing clips which prevent them from turning under in an embarrassing fashion peculiar to some designs.

The steering connections attract attention since the usual ball and socket joints are replaced with clevises and through-pins, the universal motion of the drag link being secured by means of a Hooks joint. The gear itself is of the worm and segment type and with the liberal rake of the steering column comes well in front of the dash.

The brakes are of the double-expanding type balanced as to application of the pull

and mounted in mud-proof drums on the rear wheels. In addition to the brakes, a hill-pawl attachment is mounted on the driving shaft just back of the gear box.

The power plant is carried on a subframe running up to the radiator but not including the usual cradle for supporting that member. Instead, the radiator is carried by an original form of ball and socket trunion mounting providing for universal movement due to the weaving of the frame without in the least straining the casing. An important and no less striking feature of the cooling system is the fan which is belted from the auxilliary two-to-one shaft

CHN RIFUGAL FAN ON P & S. PADIATOR

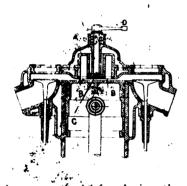

on the left side of the motor, and which, instead of being of the usual direct suction type. is centrifugal in pattern. Its framework is a solid alluminum disc of convex form upon the face of which the blades are mounted. The effect is to drive the dust and dirt which are inducted through the radiator to the outside of the bonnet instead of impinging the gritty particles against the motor itself. A second fan mounted in the fly wheel takes care of the discharge from the rear end of the bonnet.

Though of heavy construction and arched at the back to give ample clearance—over the rear axle, the frame is trussed through the waist to give added stiffness. The rear axle, which is of cast steel, except for the aluminum housing, is stayed in position by means of the usual torque rod and two radius rods which are joined to the frame on the same transverse axis as the forward universal joint of the drive shaft. The front axle is of I-beam section, of well thought out design and of very evident strength and stability—a quality which is manifest in all the details of the mechanism.

CONVERTIBLE GAS AND AIR MOTOR

Its Feature of Variable Compression to
Aid in Starting and Braking—
Simplicity of the System.

Considerable attention is being devoted to the use of compressed air for starting purposes on motors of medium and large size, at the present time, and not a few ingenious arrangements are coming to light accordingly. Typical of these, is a recent foreign device for improving the action of the motor when working on compressed air, which is worthy of especial notice as appearing under the well known name of Berliet. In a word, it is nothing more nor

less than a method of reducing the clearance volume of the cylinder for the time being thus raising the compression, when the motor is being used as a brake, and reducing the volume of air which must be admitted when it is working as a motor, in order to obtain the desired impulse.

The mechanical construction employed is comparatively simple. It is shown in the accompanying illustration, which is the outline of a T-head cylinder of the ordinary type except for the special arrangement in question. This comprises the use of the compression chamber, A, which consists of a separate casting, set into the cylinder head and carrying at its base the seating of the rotating valve, C, which has a series of ports, B-B, which may be made to register with corresponding ports in the lower side of the port, A, or to close the openings, according to the adjustment of the lever, D, above, through which the system is actuated. The valve is held against its seat and rendered air tight by means of a spring which is suitably housed in the upper part of the jacket casting, the latter also furnishing a guide for the valve stem.

When the valve is disposed as shown in the illustration, the ports leading into the compression chamber are open, so that the cylinder affords the usual amount of compression space for the gas, when the engine is run under its own power in the usual way. When the valve in question is closed, however, there remains in the center of the cylinder, only sufficient clearance to allow for the stopping of the piston without its knocking the lower face of the valve, while even with the volume over the valves and in their pockets, required to give proper space to open them, the actual clearance volume is comparatively slight.

In this way, when the motor is being used as a brake, a very high compression pressure may be secured by delaying the opening of the inlet valves until the piston has ended its stroke, while the degree of retardation obtained in this way may be regulated to the required degree, by altering the timing of the valves in any appropriate fashion. The advantage gained in a similar way when the motor is to be run on the simple expansion of compressed air, is of relatively less importance, since that use is limited and of less significance than that involved in retarding the movement of the machine as a whole.

Results of Benzol-Gasolene Tests.

Benzol, as a possible substitute for gasolene as a motor fuel has never been exploited in this country, though numerous tests have been made with it in England. A series of experiments which are now being conducted by Joseph Tracy, the New York engineer, so far as they have been carried out, however, tend to bear out the results of the foreign investigation. These indicate briefly, that if available in sufficient quantities, it would appear to be an efficient and economical source of energy for the motorist's use.

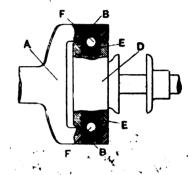

During the past week a series of comparative horsepower tests have been made on the dynamometer at the garage of the Automobile Club of America, gasolene and benzol being used alternately. These have shown a decided gain in favor of the newer fuel. The tests in which the only difference was in the fuel employed, revealed a slight gain in draw bar pull and so in horsepower, in favor of the benzol. By making special adjustments of the carburetter, however, the gain was materially increased. The superlative test-that indicated by the gradometer readings, which take into account the weight of the car as well as the drawbar pull, showed that with gasolene, the car-a Simplex runabout-was capable of climbing an 11.9 per cent. grade. With benzol the indicated grade was 12.1 With the carburetter adjusted especially for the benzol, the maximum theoretical gradient was increased to 12.2 per cent. The draw bar pull in the latter instance was 398 pounds, as against 383 pounds with gasolene.

In addition to an exhaustive series of laboratory trials which have been carried out in England, numerous road trials have been employed to good advantage in demonstrating the economy of the substitute. The most remarkable of these was a 300-mile run which was made by a touring car carrying 4 passengers. The averages at the end of the test, showed a consumption of 7½ gallons per day of 150 miles running, which works out at 20 miles per gallon.

STEERING KNUCKLE SIMPLIFIED

New Principle Applied in a Recent Foreign
Design—Adapted to the Lighter
Types of Vehicle.

It would be supposed that the design of steering knuckles had been reduced to practically its lowest terms, so long have the two principal types of Elliott and Lemoine knuckle been in use without material alteration. A modification of the former type has recently made its appearance in France, however, which plainly discountenances any such idea. It should be noted, however, that the modification in question appears to be applicable only to the very lightest types of

cars, and for work which is not subject to unusually heavy road stresses.

The design, which has been applied to the Gregoire cars—which are tunabouts of the type at present so popular on the Continent—is shown in the accompanying illustration. The principle is merely that of replacing the ordinary through pivot pin by a couple of large balls, set half and half in suitable bearings in the yoke and knuckle, above and below.

The method of construction is plainly apparent from the illustration. The yoke and knuckle ends, are drilled out to take the bearing sockets, B E, which, in turn, are shaped to form the cup retainers for the large diameter balls, F F. The cups, B B, are screwed into place, and after being adjusted to give the proper tension in the bearing, are securely locked in place. The balls perform the double function of bearings and pivots, and it would appear that the relative resistance of the assembly should be comparatively low.

As compared with the more common method of securing the assemblage by means of a pivot pin together with ball bearings of the full type, the system in question possesses the indubitable advantages of simplicity, low cost of manufacture, and natural interchangability. At the same time, the very evident peril resulting from a possible springing of the yoke sufficient to release the balls, and the danger which would arise from the fracture of one of the balls, are points against it, which only a considerable trial in actual service can convincingly overcome.

WHAT THE CLUBS ARE DOING

Old Ones Electing Officers and New Ones
Organizing—Baltimore Develops
Novel Interclub Idea.

So efficient were their services last year that the old officers were unanimously reelected at the annual meeting of the Automobile Club of Hartford, Conn. The president's report showed that during the year the club had increased from 50 to more than 200 members. The officers reelected were: President, W. F. Fuller; vice-president, C. H. Gillette; secretary, G. K. Dustin; treasurer, C. DeL. Alton, Jr. Chairmen of the various committees were appointed as follows: Membership, C. E. Whiting; contests, Hiram Percy Maxim; rights and privileges, Colonel George Pope; good roads, C. H. Veeder, and sign posts, C. D. Rice.

At its annual meeting last week, held in Lancaster, the Pennsylvania Motor Federation admitted the newly formed clubs of Norristown and Williamsport, making a total of 20 clubs and a total membership of 2,050. Officers were elected as follows: President, Robert P. Hooper, Philadelphia; vice-president, Dr. S. P. Davis, Lancaster; second vice-president, Peter A. Meixel, Wilkes-Barre; secretary-treasurer, Paul C: Wilff, Pittsburg.

Owners in Fall River, Mass, have formed the Fall River Automobile Club. The following officers were elected at the organization meeting: President, Dr. George L. Richards; vice-president, Earl P. Charlton; secretary, Arthur S. Phillips; treasurer, Albert A. Harrison; directors, the officers, H. C. Talbot, George D. Flynn, John R. Hilton, Edmond Cote, Edward B. Remington, Edward J. Jennings, and Robert Marshall.

So many members of the Automobile Club of Maryland enjoy a quiet game of whist when they are not at the steering wheel that the Baltimore Whist Club and the automobile organization have effected an arrangement whereby the members of each organization become members of the other. Each club retains its identity, the arrangement being one merely for mutual social enjoyment.

Watsonville, Cal., now has an automobile club, the Pajaro Valley Automobile Club having been formed last week with these officers: President, Dr. P. K. Watters; vice-president, James Sheehy; treasurer, W. D. Gulick; secretary, W. S. Foltz; directors, R. J. Cox, Carl Christenson, W. J. Russell, C. H. Baker, and P. W. Morse.

The Virginia State Automobile Association was organized last week with the Tidewater Automobile Club of Norfolk and the Automobile Association of Richmond as members. Officers chosen were: President, Joseph E. Willard; vice-president, Abbott

Morris; secretary-treasurer, O. M. Alfriend.

The Fairbault Automobile Club has been formed in the Minnesota city of that name with these officers: President, A. Blodgett, Jr.; vice-president, K. D. Chase; secretary-treasurer, W. M. Nutting; governors. Willard McM. Reid, John E. Dobbin, Walter Scott and Dr. C. W. Wilkowske.

The following officers were elected at the annual meeting of the St. Paul (Minn.) Automobile Club: President, Reuben Warner; vice-president, R. M. Neeley; secretary, H. S. Johnson; treasurer, A. Washburn; directors, Oliver Crosby and W. Hurd.

The Arkansas Valley Automobile Club, Pueblo, Col., has elected the following officers for the ensuing club year: President, Lee Graham; secretary-treasurer, Homer

CETTING COUNTRY HOUSE IN ORDER

Long Island Automobile Club's Summer Rendezvous "Swept by Ocean Breezes"

—Its Location and Attractions.

Preparations for opening the country house of the Long Island Automobile Club are advancing rapidly, and there is reported a large volume of correspondence promising an increase in membership. The house, which is to be held under lease, is on the T. B. Ackerson company's property, known as "Brightwaters," in Bay Shore, Long Island, 39 miles from the present city club house of the L. I. A. C. The house

COUNTRY HOUSE OF LONG ISLAND AUTOMOBILE CLUB

E. Brayton; directors, George E. King, Homer E. Brayton, Lee Graham, L. C. Walker and Dr. Crum Epler.

The Roanoke Automobile Club has been formed at Roanoke, Va. It will become a member of the State automobile association which has just been formed. Officers will be elected by the directors, who are as follows: J. H. Marstellar, W. E. Michael, C. M. Armes, J. C. Cassell, Dr. J. D. Kirk, E. M. Funkhouser, Dr. Norris, Judge Waller R. Staples and A. B. Hammond.

With its jurisdiction extending over Wexford, Osceola and Missaukee counties in Michigan the Cadillac Automobile Club has been formed with these officers: President, George Westover; vice-president, Charles E. Haynes; treasurer, Wynter Massey; secretary, Fred A. Anderson.

The New Albany (Ky.) Automobile Club has organized with the following officers: President, John S. McDonald; vice-president, Dr. Charles P. Cook; secretary, Dr. R. S. Rutherford.

The Kenton Automobile Club has been organized at Kenton, Ohio, with twenty charter members. It will become a member of the State association.

sets back about 300 feet from the Merrick or South Country road. It is 3,900 feet from Great South Bay, where an excellent beach suited for bathing is located. The grounds are large and laid out with shrubbery, shade trees, etc. The house has four large rooms and a spacious hall on the ground floor, besides pantry, kitchen, etc. On the second floor are five large rooms and bath. On the third floor are six rooms with bath and shower. There are spacious piazzas on three sides of the structure.

The house is to be conducted as a pleasant rendezvous for members and their families. A competent manager will be in charge; the table will be of the best and a limited number of sleeping rooms will be available for members.

About twenty-five automobile owners of Willimantic, Conn., met in the Board of Trade Rooms on the 8th inst., and organized the Willimantic Automobile Club. The officers elected are: President, Dr. John Weldon; vice-president, J. B. Fullerton; secretary, L. B. Lincoln; treasurer, E. F. Writmore. The board of governors consists of these officers, with D. W. C. Hill, E. P. Chesbro and T. F. Howie.

G & J TIRE LOSES ON APPEAL.

(Continued from Page 70)

Claim 3 shows that Golding used a sheath and an inner inflatable tube.

This patent was purchased by the appellant soon after it was issued, and owned by it down to the time it expired.

The first Jeffery patent in suit, No. 454,115, is for an improvement in wheel tires, and "is designed to provide improved means for protecting a rubber wheel tire, and is particularly designed and adopted for an inflation tire—that is to say, a tire having a core composed of an elastically expansible tube. which is inflated by air or gas and distended thereby to some extent, the air or gas being under such tension that but for a restraining or enclosing sheath such core would be liable to burst."

The inflated core or elasticany expansible tube, encased in a restraining sheath of the Dunlop patent is the same in the Jeffery patent. The improvement of the latter, among other things, over the Dunlop extends to the device for attaching the tire to the rim of the wheel. This, in the description, we find is a "rim" provided with hooked edges. "The hooks may be turned either inward or outward. The tire sheath is provided with corespondingly hooked edges. corespondingly hooked edges. . . . Ordinarily the entire sheath will be made of canvas or similar woven fabric comparatively inelastic, and in that event the hooked edges will be stiffened with caoutchouc or India rubber, or they may be vulcanized if the sheath is made of suitable substance to endure the temperature. On some accounts the hooks on the rim are preferably turned outward, chiefly because the center of the body or inflatable core is thereby rendered free from the irregularity which the hooks form when they are turned inward. On the other hand, the liability of the sheath hooks to be pulled out from the rim hooks hy the expansive tendency of the core when inflated is somewhat less when the hooks are turned inward; but practically the two methods are about equally desirable." In either case, it should be observed that the hook is open toward the axis, and it is preferably approximately in the direction of a tangent to the inflatable core, so that the expansive tendency of the core will tend to draw the hooks into close engagement.

This improvement in the attachable device, which the patentee has designated "hooked edges," both on the rim and on the tire, is variously stated in claims 1, 2, 3, 4, 5 and 6, which claims the defendant is charged with infringing. They are as follows:

ant is charged with intringing. They are as follows:

1. "In combination with the rim having recesses open toward the axis of the wheel, the tire-sheath having its edges reversed and engaged in such recesses, and the elastic exnansible core between the rim and sheath, substantially as set forth.

2. In combination with the rim having hooked lateral edges, the tire-sheath transversely flexible and having hooked edges which detachably engage the hooked edges of the rim, substantially as set forth.

3. In combination with the flexible tire-sheath having rigid hooked edges, the rim having hooked edges to engage those of the sheath, substantially as set forth.

4. In combination with an inflatable core, the rim in which such core is seated, having its edges

edges to engage those of the sheath, substantially as set forth.

4. In combination with an inflatable core, the rim in which such core is seated, having its edges reversed to form hooked flanges approximately tangential to the core, and the flexible sheath for such core, having its edges encaged in such hooked flanges substantially as set forth.

5. In combination with the rim having hooked lateral edges, the flexible sheath and rigid strins about which the lateral edges of the sheath are wrapped inserted with the enwrapping-sheath edges within the hooks at the edges of the rim, substantially as set forth.

6. In combination with the rim having hooked lateral edges, the flexible sheath and rigid strins about which the lateral edges of the sheath are wrapped, such strips being folded with the enwrapping sheath to form rigid hooks at the edges of such sheath, such hooks being engaged with the hooks at the edges of the rim, substantially as set forth."

It will be seen that the attachable device in this

·It will be seen that the attachable device in this patent is the "hooked connection" of the sheath and tire edges. The patentee says: "the rim is provided with hooked edges," and, as said by the court below, these hooks on the rim are "doubled back U shaped, so as to form recesses and permit engagement in such recesses of corresponding hook points on the hooks of the sheath." This hook is open toward the axis and is "preferably approximately in the direction of a tangent to the inflatable core

so that the expansible tendency of the core will tend to draw the hooks into close engagement.'

The complainant never manufactured tires with the attachable device described in its patent No. 454,115. It was found to be, to say the least, an objectionable means of attachment, and no tires were manufactured as therein described, but the com-plainant modified its form of attachment by changing the device from a hook, with its opening toward the axis, to a projection of the rim more nearly parallel to the flat surface of the rim, and changed the angle of the hook on the tire more nearly to that of a flange to correspond with the tire. is the form of the appellee's device, and if the hook shaped attachment described and claimed in appellant's patent No. 454,115 includes the form appellant has used down to the present time, then the appellee has infringed, because the latter is using the same kind of attachable device used by appellant, but the appellee claims both are using the device described in the Golding patent, which has expired and was public property before appellee began to use it.

When Jeffery patented his hooked device set forth in No. 454,115, the field had been well covered, and if he had made his claim sufficiently broad to include "an extension of a rim partly or nearly parallel with the flat portion of the wheel with the flange on the tire to correspond, such as both parties here are using, he would have invaded the domain pre-empted by the Golding patent, of which the "edges of the rim are bent round and brought a short distance toward each other and nearly parallel to the flat surface of the rim, thus forming an inner recess . for holding the project-The tire is made to fit the rim rather tight . . . and the flanges spring into the recesses." So that the Jefmade to fit the rim rather tight and the fery patent can only be sustained by a construction restricting it within the narrow limits of the hooked device which "opens toward the axis," and cannot be extended to a flange "nearly parallel to the flat surface of the rim," and so construed, it is not infringed. It will, therefore, be unnecessary to consider the question of the patentability of Jeffery's improvement.

The conclusion of the court below that the second patent, No. 558,956, was not infringed, we also think is correct, and we cannot do better than to quote the language there used.

think is correct, and we cannot do better than to quote the language there used.

"The second patent is No. 558,956, issued April 29, 1896, for a wheel tire, claims five and ten of which are alleged to be infringed. Respondent defends on the ground of non-intringement. We are of the opinion the defense is sustained. The subject matter of this patent, its late date in the art, and the close differentiations required to obtain the narrowly limited claims in question indicate the patent was restricted to a comparatively narrow field of improvement. The specification states: This invention relates to tires having inflatable cores; and it consists in the character and construction of the inclosing sheath and the mode of securing the same to the rim. The character and construction of the proposed sheath are specifically shown. No novelty was suggested in the rim. Its construction for the broader type of the device is: The rim is a hollow rim made in familiar manner from tubing having the outer side transversely concave to form a seat for the tire. A special form is suggested: For the purpose of adapting it to receive my improved tire the rim is preferably formed with the peripheral channels A-1 A-1 in the outer or concave wall: but these are not essential to my invention considered in its broadest phase. Their use, when present, will appear from the further description. The lateral portions of the sheath the outente made of folded canvas or other web, ioined at the folded edges to thread or rubber of sufficient thickness to stand wear and 'sufficient elastic flexibility to adapt it to vield with the core, and having also tensile elasticity. So that the sheath which comprised it as the middle section is transversely extensible to a slight degree. The purpose of this extensibility was to adapt the sheath for use with either an inflatable or non-extensible core. At the outer end of the folded canvas, hooks or buttons were placed and in the rim at corresponding distances were put engaging eyelet holes or buttons were pla

edge, and as compares with familiar advantage that the fastening need not even be relaxed or slackened anywhere except at a point where it is desired to completely detach in order to get assette to the core.'

' make the fastening still more secure the patentee suggested an additional element, which it will be noted forms an element in the claims here in controversy. It is thus described: 'It is not a necessity that the lateral pieces C,—that is, the canvas of web sides—terminate at their lines of reinforcement or attachment to the rim, and, on the contrary, one or both of them might be extended farther under the inflatable core, so as to rest between said core and the rim and form a lining for the seat of the core in the rim; and such extension adapts the sheath to be held more firmly in its place by the inflation of the core, and such inflation, holding the inwardly extended edge of the sheath firmly seated between the core and the rim, keeps the beads formed by the core c'—an alternative construction of strengthening cord placed in the folded edges of the web—'in the grooves or channels A-1 of the rim and makes them assist materially in holding the sheath from spreading when the core is inflated.'

The limited side type is described in claim two, which reads as follows: 'The rim and an inflatable core combined with an envelope or sheath for the core parted under the core and fastened to the rim at two peripheral lines, one on each side of the place of parting, and detachable from the rim at one of the said lines of fastening; said sheath having its lateral portions flexible, but not laterally extensible, and its middle portion, including the thread, elastically extensible; substantially as set forth. And the extended side in claim five, which is for: 'The rim and an inflatable core combined with an envelope comprising a thread of cushioning substance and lateral portions composed of textile fabric which are joined to the rim at two peripheral lines, and extending inward operates on said inwardly-extending fa

In the respondent's device, however, the sheath ends with its two peripheral side connections with the rim. No theory or ingenious contention can change that fact, and fact, not theory, is the test of infringement. Accordingly we hold respondent does not infringe."

The decree is affirmed with costs. Filed, April 1, 1908.

Lubricating After the Winter's Lay-up.

When putting an automobile in service after the winter's "lay up," care must be taken to thoroughly drain the crank case of all the old lubricant. It is well to supplement the draining by the introduction of a liberal amount of kerosene; then run the engine for a minute or two so that the scouring propensities of the kerosene may have the opportunity of acting on all the recesses in the crank case, after which it should be withdrawn and fresh lubricating oil supplied.

The front and rear wheel hubs and axles should be carefully cleaned and repacked with new grease and the steering mechanism treated in the same way. All grease cups should be taken off and cleaned, the verdigris that will be found in these should be cleaned out and new grease substituted for that which has been left in over winter. Gasolene which has remained in the tank where air could reach it should be drained out as it will have deteriorated: it can be used for washing, but will not give good service as a fuel even if mixed with a fresh supply. Finally, the mechanical oiler should be dissected and thoroughly cleaned before using.

LIGHT ON THE AUTOMOBILE BILL

Terry Answers Some "Whys" Concerning Pending New York Legislation—His Opinion of Proposed New Law.

It was not in exchange for practically unlimited speed that the New York State Automobile Association agreed to the clausein the new automobile bill which provides that the name of convicted offenders should be "posted" in every county of the State. When Charles Thaddeus Terry, the counsel of the association was asked why this clause was inserted he replied:

"It was a necessary concession to some of the legislators who demanded that the bill should provide for imprisonment for the first offense. While this contention was manifestly unfair and would act as an injustice to a man who ordinarily obeyed the speed rules, these legislators maintained that a magistrate had no way of knowing whether the prisoner was a 'first offender' or a twenty-first. When it was shown to them that it was practical and possible for the magistrates throughout the State to have absolute knowledge of all offenders who were brought before them, they readily agreed to waive the imprisonment clause if the provision was inserted for furnishing the police records of all drivers. In my opinion the concession on both sides was for the best interests of the automobilists."

Mr. Terry was then asked what was meant by "reckless driving," for which a penalty is provided, though the bill contains no speed limitations.

"Reckless driving means reckless driving," he responded. "The idea is to do away with the absurdity of the existing law which permits of the same rate of speed in a congested business street that may be maintained on a suburban highway. There are places where, under certain conditions, it would be reckless to exceed a speed of five or six miles an hour, and again one could travel at the rate of 30 miles with perfect safety."

"Is it constitutional to require a man to take out a license to earn his living by manual labor?" asked the interviewer, who remarked the increased registration fee for chauffeurs.

"That involves a point which only the courts can decide," was the reply. "There is a question as to whether the chauffeur is licensed or whether he received a franchise to operate a vehicle on the public highways."

"But in what respect does a chauffeur differ from a coachman?" persisted the interviewer.

"Not in any way; and that question brings up the point that I always have made—that automobile bills constitute class legislation and discrimination that is unjust and illegal. But people are a good deal like horses in regard to automobiles. They must be educated to their use. The automobile bill still is a new thing, and as such it is a subject for general discussion and for legislation. This is not as true of the cities as it is of the country districts, but the rural residents demand certain things of their legislative representatives and these demands must be complied with. I think that the present bill is distinctly more favorable to the automobile interests than is the existing law. When another bill is drawn up it will be more favorable than its predecessor and so it will go until the automobile will become a vehicle in common use and then no legislation discriminating against it will be demanded and it will enjoy the same rights and privileges as are now accorded to horse drawn vehicles."

"Supposing a chauffeur's organization decided to test the constitutionality of the act requiring them to pay for a license or for registration, what do you think would result?"

"I believe it would be a most unwise step. The present amount of the registration fee is nominal and works no hardship on anyone. The question is not now one that is attracting much attention, but a little agitation of it would make it a live issue, with the very probable result that some examination or test would have to be undergone before a certificate would be granted. It is far better not to take up that subject. It will work out satisfactorily in the end.

"There are some features of the bill," said Mr. Terry, in conclusion, "which could be improved, but it is unwise to attempt that at this time. If you begin to alter the bill the legislators simply will throw up their hands in disgust or else will take an active part in the reconstruction; for that reason it is best to let it go as it is, and next year. If occasion demands it, certain alterations can be made in the subdivisions, but, I repeat, the bill as a whole is a decided in provement on the existing law."

Mexico's Annual Cup Race Postponed.

Mexico's annual Jalisco cup race will not take place on April 20th as was planned. At the present time the roads around Guadalajara are not in good condition for racing and the entries came in slower than was expected. Accordingly the race has been postponed until November 5th, when it is planned to considerably increase the scope of the meet.

Plans Decoration Day Hill Climb.

As the hill climbing contest last year was such a success the Cleveland Automobile Club has decided to hold the climb again on May 30th next. The plan followed last year of classifying the cars according to piston displacement will again be used, and there also will be a special final event.

RUNNING ON BLIND SCHEDULE

Quaker City "Roadibility Run" a "Guessability Game"—Johnson the Best Guesser Among 31 Contestants.

Calculating his speed within one-third of a second of the time in his sealed orders, F. M. Johnson, driving a Winton car, was declared the winner of the first annual "roadibility run" of the Quaker City Motor Club from Philadelphia to Cape May, on Saturday last, 11th inst. The distance was 92 miles.

Although it was styled a roadibility run the contest was more of a "guessability" game, as none of the thirty-one contestants knew what they were to do when they started. The game was to see which driver was the best guesser. When the cars left the Walton, in Philadelphia, the drivers were handed sealed envelopes containing the required time in cipher. When all the cars arrived in Cape May the envelopes were opened and the driver who had made the run in the period of time nearest corresponding to that predetermined and kept secret by the contest committee, was awarded the trophy. All the that no sealed times called for a rate greater than the legal limit of twenty miles an hour.

When the envelopes were opened at Cape May, Johnson was found to have guessed nearest to the time marked in his envelope. He covered the distance in 5 hours 54 minutes 1834 seconds. The time given his car in which to make the run was 5:54:18. Second prize was given Dr. E. M. Lengle, Matheson, who finished 25 seconds ahead of his sealed schedule time. A. E. Maltby, Winton, was a close third, 26 seconds too soon. These figures all are so well within the speed limit that the performance, which would have been a remarkable one-in the line of guessing-had only one competitor made such an excellent hit, borders somewhat on the wonderful.

The route was from Philadelphia to Camden, Egg Harbor, May's Landing, Esterville, Tuckahoe, Seaville, Cape May Court House and Cape May. The drivers who played the game were:

L. E. French, Pullman; Max La Roche, Pullman; E. C. Benson, Apperson; Charles J. Swain, Apperson; A. M. Benson, Apperson; P. D. Folwell, Packard; J. A. Hudson, Marmon; E. M. Lengle, Matheson; B. F. Pierce, Ford; F.M Johnson, Winton; J. Shelton, National; R. W. Steele, Apperson; W. M. Swain, Apperson; A. E. Maltby, Winton; H. N. Wilkins, Thomas; R. E. Ross, Elmore; O. W. Hoffman, Stearns; T. W. Berger, Oldsmobile; Joe Kier, Thomas; M. B. Reeves, Apperson; F. Geiger, Maxwell; L. C. Simpson, White; J. H. Schenck, Winton; J. N. Wilkins, Ford, and Frank Yerger, Studebaker.

BAY STATE "SQUFEZER" STRANGLED

Adverse Committee Report on Proposed
Additional Taxation of Automobiles—
Important Features in New Bills.

Something has happened in the Commonwealth of Massachusetts, since the last issue of the Motor World, that has switched off the track the "squeezer" bill that was to carry out Governor Guild's proposal to get more money from the automobilists. Indications of a week ago pointed to the strong probability of a measure being reported under which new taxation would be imposed on automobiles, with a graduation in the size of the fees to be exacted for registration. The Committee on Roads and Bridges, however, has given more mature consideration to the question with the result that it reported "no legislation necesary" on that portion of the Governor's inaugural address wherein the suggestion for increased taxation was made.

On the other hand the committee has vielded to the demand of the anti-automobile element on the island of Nantucket and has reported a bill that is designed to give to the selectmen of the town of Nantucket the power to exclude automobiles from the island between June 15 and September 15 of each year. In order to get an idea of the actual situation there the members of the committee visited the island early during the current month. The trip of 30 miles across the turbulent waters of Nantucket Sound was too much for the stomachs of the solons, and it is possible that one result of their seasickness was that they couldn't see why automobilists should want to go to Nantucket anyway.

The most important bill reported by the committee is one incorporating many of the suggestions of the Highway Commission and the Safe Roads Automobile Association. In this bill there appears a new section designed to bring non-resident automobilists more closely under the Massachusetts laws. The present law permits non-residents, whose cars are properly registered in their home States, to use them in Massachusetts for a period of seven days without a Massachusetts registration. As a matter of fact, it is said that many nonresidents have used their cars there all summer, going out of the State at intervals so as seemingly to comply with the law. If the drivers or owners of these cars happen to be convicted of an offense against the automobile laws of Massachusetts they are brought into court and fined. That is as far as the law can go, for having no Masaschusetts registration they cannot be penalized by the Highway Commission.

The new bill as reported adds to the section of the law which permits non-residents to use their cars in the State for seven days the following sentence: "But if any such non-

resident be convicted of violating any provision of the laws of this Commonwealth relating to automobiles and motorcycles and to the operators thereof, by any court or trial justice, whether or not he appeals, he shall thereafter be subject to and required to comply with all the provisions of this act relating to registration of motor vehicles and the licensing of operators thereof." In other words, if a driver of a non-resident automobile is convicted in a police or district court of overspeeding he must forthwith take out a Massachusetts license and registration.

Under advice from the Attorney General's office the committee changed the provision of the bill relating to running away after an accident. In the original draft this clause read: "or goes away without stopping and making himself known after causing any accident to any person, or any serious accident to any property, unless he can prove a justifiable excuse." The clause now reads: "or who without a reasonable excuse therefor goes away without stopping and making himself known after causing injury to any person or property." The change is obviously to the advantage of the automobilist, for he can prove a "reasonable" excuse, perhaps easier than he can a "justifiable" excuse. The penalty for running away is fine or imprisonment and the loss of license.

A new section of the bill provides that the Highway Commission may issue certificates and licenses without charge to members of the foreign diplomatic corps; may charge an additional fee of two dollars for examination of an applicant for a license, and may charge fifty cents each for duplicates of certificates or licenses. The bill also appropriates \$3,000 to help defray the expenses of the inspectors who are to be appointed by the Commission to investigate accidents.

Testing Chicago's Wheel Tax Ordinance.

Chicago's wheel tax ordinance, which was passed by the city council February 3, is now ready to be put to the test of constitutionality in the Supreme Court. Judge Carpenter of the Circuit Court, handed down a decision on Friday of last week, holding that automobiles and vehicles used for recreation and purposes of pleasure may not be taxed under the ordinance. The finding was on a bill filed by Charles C. Harder and his son Charles C. Harder, Jr., asking an injunction to prevent the collection of the tax on pleasure vehicles belonging to them. Several weeks ago the Harder Fire Proof Warehouse Van Co. filed an injunction petition to prevent the collection of the tax on vehicles used for mercantile purposes. To this the city filed a demurrer which was sustained, the complainant taking an appeal on the ground of the alleged unconstitutionality of the statute and ordinance providing for the tax. The more recent action was intended to broaden the scope of the original motion.

FEES DETERMINED BY HORSEPOWER

Rhode Island's New Automobile Bill Provides for Graded Taxation—Also Limits Speed to Twenty Miles.

As the result of a number of meetings of the judiciary committee of the Rhode Island Assembly, a new automobile bill has been framed for submission to the House. In a general way it conforms more closely to the measure introduced by Representative Phillips of Coventry than to the bill drawn in the interest of the Rhode Island Automobile Club, or the one introduced by Representative Olney Arnold, of Providence. The Phillips bill provided for placing the control of automobiles in the hands of the board of public roads instead of the Secretary of State, as at present. This provision was opposed by Col. Frank W. Tillinghast, of the Automobile club's special legal committee, at a hearing given in February and reported in the Motor World at that time. It appears, however, in the new bill, which also follows the Phillips measure in dividing motor vehicles into three classes for licensing purposes. The division is made according to rated horsepower and fixes the amount of license fees as follows: For vehicles of 10 horsepower and under, \$5; for vehicles between 10 and 35 horsepower, \$10, and for vehicles of 25 horsepower and over, \$25.

The bill limits the speed of automobiles to 20 miles an hour, providing that in no event shall a person operate or cause to be operated a motor vehicle at a greater rate of speed. In a public highway where the territory is closely built up, the speed shall not be greater than one mile in six minutes. Elsewhere in a city or village the speed may not be greater than a mile in four minutes, or elsewhere outside of a city or village a mile in three minutes.

The bill forbids the operation of a motor vehicle on the public highway when the driver is intoxicated, or is engaging in a race, or running his machine as the result of a wager.

New Bill Ignores Police Lieutenants.

Under the proposed automobile law now pending in the New York State legislature, lieutenants of police will not have authority to accept bail from persons arrested for violating the law. In the section relating to bail, etc., it is provided that any captain. sergeant of police or acting captain or sergeant of police may accept bail. While undoubtedly it is intended that the power of those officers of the police force of New York City, who formerly were ranked as sergeants, is to continue, yet the wording of the law now gives this authority to what were formerly roundsmen, as they are now distinguished as sergeants, and their superiors as lieutenants.

REMEDY FOR NOISE IN CHAIN DRIVE

Good Results to be Secured by Thorough
Cleaning and Lubrication—Effective
Methods for the Process.

To give proper care to driving chains usually entails the dirtiest kind of dirty work. One reason that is often advanced to account for a preference for shaft driven cars, over those where the power is transmitted by chains, is that the former are more quiet. But this explanation is not founded on fact. While it is true that the shaft driven car usually is the more quiet of the two, yet invariably the noise that is made by the chains can be eliminated if proper care is given to them; but because this care means that one must get right into oil, grease, and dirt, it is seldom that the man who looks after the car will do it unless he absolutely is required to do so.

When a chain rattles or squeaks it is the outward sign that it needs oil, and generally the oil is applied to the outside of the links where, though temporary relief from the squeaking is obtained, it serves mainly to collect dirt, and shortly the condition of the chain becomes worse than it was before the application.

If a chain needs oil it should be given oil where it requires it and that is on the inside of the rollers. To accomplish this thoroughly, yet in the simplest way, necessitates the installation of a simple apparatus and then a few minutes of intelligent work. There should be a stove, or heat of some sort over which is placed a pot of very heavy oil, or mutton tallow, or a thick grease that will become fluent when heated. Directly above this in the ceiling, should be a pulley through which a rope with a hook in the end of it should be passed.

The chains should be removed from the car and thoroughly cleaned in gasolene, kerosene, or in a solution of bi-carbonate of soda, after which they should be soaked for several hours in the hot oil or grease that is over the fire. The immersion in this lubricant should be sufficiently long to permit of every part of the chain becoming thoroughly coated. When this has been accomplished, the chains should be drawn out of the oil by means of hook and rope and should be suspended above the pot of oil and allowed to drip into it. When the chains have become cold it will be found that a film of the lubricant has coated the inside of links and rollers; the oil remaining on the outside should be thoroughly removed.

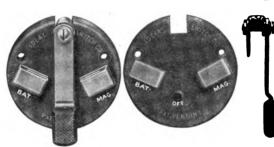

In replacing the chains on the machine, if a proper adjustment is made, they will run without noise and the satisfaction to be gained from a quiet running car well repays for the trouble of giving the chains a proper treatment. A chain cannot be thoroughly lubricated by the introduction of

oil from the outside; it is the inside of the links that must be reached and this can only be done by soaking in a lubricant that is hot. Melted tallow is the best thing, heavy grease that will run freely when hot is the next best, and if neither of these can be obtained, a heavy oil will furnish good results under this method of cleaning and lubricating.

Battery Switch with Novel Features.

One of the new accessories which is likely to find favor with automobilists is the Ideal automobile switch made by the Ideal Switch Co., Inc., of Plainville, Conn.

In addition to furnishing a large contact surface between the blade and the terminals when the circuit is closed, the switch contains other features which are more or less

novel. When the circuit is open the blade readily may be removed. When removed, it practically is impossible to obtain a contact through the switch, as the circuit terminals are on the back of the switch and so arranged that they cannot be brought in contact save through the medium of the blade, which is of an unusual and irregular shape.

When the circuit is closed there is no possibility of the blade being removed from the switch, as the peculiar form of the contact terminals cause them to serve as a locking device which hold the blade in position. Another feature of the switch is that the neutral point, a copper stud which is shown in one portion of the illustration and is marked "off" may be used as a contact point when connected with the ground wire of a high tension magneto.

The switch is strongly made. The body or base is of hard rubber, the contacts are of heavy copper, plain or nickeled, as one may prefer.

Prolonging the life of Horn Bulbs.

Horn bulbs which develop a tendency to crack and break just inside the raised ring which is invariably placed at the "business" end, may be repaired in a serviceable though unhandsome manner, by paring down the ridge carefully with a sharp knife and then cementing on a circular patch of thin rubber, such as may be obtained from an old inner tube. Properly done, such a repair will prolong the life of the bulb to a surprising extent without in the least impairing its usefulness, though its beauty may be sadly marred.

CLEAN STORAGE FOR LUBRICANTS

Its Necessity Illustrated by a Costly Experience—New Car Crippled by Trash

Dropped into the Oil.

Cans containing oil or grease always should be kept covered. An uncovered can of heavy transmission oil recently was the means of putting the owner of an automobile to several hundred dollars' expense, which easily could have been avoided if the receptacle containing the oil had been properly protected against the introduction of a foreign substance.

The car was a new one and having been used for a month or two the chauffeur de-

cided to replenish the lubricant in the transmission case. To accomplish this a plate was removed from the top of the case and heavy oil was poured in. A day or two later at a time when the car was being driven rapidly through the street there was a sudden crash somewhere in the car's interior mechanism, followed by an even more sudden stoppage of the automobile. Without attempt-

ing to proceed further under his own power the chauffeur sent for horses and was towed to the garage. It quickly was found that the trouble was in the transmission case and an inspection of this part disclosed a serious state of destruction; two of the gears were entirely destroyed and the cause of the mishap was found to be a steel washer which was so different from anything that was used in the construction of the car as to identify it as being something that must have gotten into the transmission case when the lubricant was poured in. The can containing the oil was then examined and in the bottom of it were found two more scraps of iron which, through carelessness, accident, or design, had found their way there.

While it is not always practical to strain the lubricant while introducing it into the working parts of a motor car, it is possible to use sufficient precaution to prevent foreign substances as large as a washer or nut from being carried in with it, and owners should insist on precautions, the neglect of which may involve large outlay.

Replacing Union on Gravity Tank.

When it is necessary to replace the union connecting the outlet of a gravity fuel tank with the stop cock, it is best to remove the tank from the car and invert it. Where this is not convenient, however, it is possible to accomplish the desired result without even going to the trouble of emptying the tank, by merely stopping up the air vent in the filling plug. This will check the flow very materially, and by working quickly it is possible to effect the connection without much loss either of time or gasolene.

The Week's Patents.

883,255. Power Lever. William W. Sutherland, Griswold, Iowa. Filed Aug. 26, 1907. Serial No. 390,215.

1. The combination with a frame, of a driving shaft provided with a crank arm, a pedal shaft having a similar crank arm, a pitman connecting the crank arms, levers pivotally connected with the pitman on opposite sides of one of the crank arms, and links pivotally connecting the levers with the frame.

878,564. Wheel for Vehicles. Thomas W. Rieder, Pittsburg, Pa. Filed Feb. 28, 1907. Serial No. 359,841.

1. A vehicle wheel consisting of a hub, radially disposed spokes carried thereby, an inner rim carried by said spokes, a felly surrounding said rim, spring fastening plates connecting with said felly and said rim, pins loosely mounted in said plates, coiled springs interposed between said plates, and having their two end convolutions bent to form eyelets to engage the ends of said pins upon each side of said wheel.

878.706. Carburetter. Lars Anderson, New York, N. Y., assignor to Triplex Gas Engine Company, New York, N. Y., a Corporation of New Jersey. Filed Nov. 22, 1906. Serial No. 344,536.

1. In a device of the character described, a chamber in the form of a hollow sphere or globe, and having an unobstructed interior, a pipe for delivery thereinto of the mixture of oil and air, a delivery pipe communicating radially with said chamber, a spherical or globular inclosing casing for said chamber forming a jacket therefor, an exhaust pipe connection delivering from the engine to said jacket, and an exhaust connection to the outer air delivering from said jacket.

878,708. Heated Steering Wheel. Charles Berg, New York, N. Y. Filed March 25, 1907. Serial No. 364,338.

1. A steering wheel provided with a hollow rim, an insulating core therein, a heating coil on said core, another heating coil enveloping the first named coil, insulations for keeping the coils from contact with each other and with the wheel rim, and means whereby current may be suppjied to both coils or one of said coils.

878,713. Vehicle Wheel. Nathaniel Dryden, Los Angeles, Cal. Filed Nov. 19, 1906. Serial No. 344,050.

1. An interacting vehicle wheel, comprising a hub member having a resiliently supported felly and annular guide plates secured thereto, and an outer member comprising two annular rigid members connected together by spokes, and having a plurality of plates secured thereto so as to form annular grooves, said grooves adapted to engage the guide plates of the hub member, whereby the two members are held in engagement.

878,714. Spring Wheel. Harris T. Dunbar, Buffalo, N. Y. Filed Feb. 11, 1907. Serial No. 356,724.

1. A spring wheel comprising a hub, a rim, yielding means operating to hold the rim concentric to said hub, and a frictional connection between said hub and rim, independent of said yielding means, substantially as set forth.

878,747. Starting Device for Explosion Engines with four Cylinders. Hippilyt Saurer, Arbon, Switzerland. Filed October 6, 1906. Serial No. 337,707.

1. In a four-stroke cycle explosion en-

gine with four cylinders, the combination with four spring-pressed inlet valves in the four cylinders, of a connection on the four cylinders above said four spring pressed inlet valves and comprising a cylindrical bore in its middle with four openings to the spring pressed inlet valves, and a roto turn in the cylindrical bore of said connection and provided with two apertures and so driven as to make one revolution on every two revolutions of the crank shaft, its two apertures being so disposed as to severally and each supply compressed air or gas through the respective channel to either of two cylinders during that stroke of its piston, during which in the normal work of the engine the expansion of the exploded gases would take place.

878,954. Driving Mechanism for Automobiles, etc. Henry K. Holsman, Chicago, Ill. Filed April 20, 1907. Serial No. 369,198.

1. In a device of the class described, the combination with the driving shaft and the pair of discs with their driving surfaces facing each other secured thereto of the driven shaft and the driven disc carried thereby located between the driving discs, and means for translating said driving shaft to engage one or the other of the driving discs with the driven disc.

878,948. Carriage Hood. Traugott Golde, Gera-Reuss, Germany. Filed Feb. 11, 1907. Serial No. 356,909.

1. A folding top comprising main hoops and auxiliary hoops pivoted thereto, and outrigger hoops one of which is pivoted at its ends to the forward main hoop and has break joints in its side arms. supporting arms pivoted to said forward main hoop, and at their outer ends having the other of said outrigger hoops pivoted thereto, and being pivotally conected between their ends to the first mentioned outrigger hoop.

878,953. Motive Power. Henry K. Hess, Philadelphia, Pa. Filed March 23, 1903. Serial No. 149,118.

1. A steam engine and a boiler connected thereto in combination with a gas engine, means to conduct the exhaust from the gas engine to the boiler to generate steam therein, a normally closed valve in the connection between the boiler and steam engine, and means actuated by the steam pressure for opening said valve.

878,955. Driving Mechanism for Automobiles. Henry K. Holsman, Chicago, Ill. Filed April 20, 1907. Serial No. 369,199.

1. In a device of the class described, the combination with a traction wheel having a tread surface and carrying a tire rim, of a driving disc having a deep groove whose sides set at an acute angle to each other are adapted to engage the outer edges of the rim, which edges have a corresponding angle, and means for rotating the disc.

879,027. Automobile. Louis M. G. Delaunay-Belleville, Paris, France, assignor to Société Anonyme des Automobiles Delaunay-Belleville, St. Denis, Seine, France, a Corporation of France. Filed Sept. 30, 1907. Serial No. 395,206.

A device of the class described comprising a tube forming a forward extension of the differential box and surrounding the cardan shaft, but not touching it, the front part of this tube ending in a socket and being supported in a bearing arranged at the extremity of a single connecting rod, the other extremity of which is able to rock around a ball fixed rigidly to the chassis.

879,045. Fluid Clutch. William W. Henderson, Washington, D. C., assignor of one-

half to Hugh A. Thrift and William Hinds, Washington, D. C. Filed June 11, 1907. Serial No. 378,415.

1. In a fluid clutch, the combination of a driving member, a driven member, a casing upon one of said members, having therein a fluid chamber and a passage in the casing connecting opposite ends of said chamber, a rolling piston carried upon the other member, and adapted to travel in said chamber and force fluid through said passage when it is open, and a valve in said passage.

879,086. Variable Speed Gearing. Bassett M. Coffee, Richmond, Va., assignor of one-fourth to William J. Whitehurst, Richmond, Va. Filed March 7, 1905. Serial No. 248,860.

1. In a variable speed gear, a driving shaft; a driving pinion fast thereon, a pair of pinions loosely mounted on the shaft for independent movement, a brake drum having an internal rack, a brake shoe for the drum, independent sets of planetary gears that connect the brake drum with both of the loosely mounted pinions and means for locking either of the said loose pinions from revolving, and other planetary gears connecting the first mentioned sets of planetary gears with the driving pinion.

879,100. Friction Clutch. Charles R. Greuter, Holyoke, Mass., assignor to Matheson Motor Car Company, Wilkes-Barre, Pa., a Corporation. Filed Feb. 7, 1906. Serial No. 299,970.

1. In a clutch, the combination with the wheel member, of a fixed clutch shoe consisting of a ring bolted to the wheel member and seated against its rim portion, a spring released movable clutch shoe loosely supported at one side of the fixed shoe, a rotatable hub arranged at one side of the wheel member and carrying a friction disc located between the two shoes, and a plurality of suitably actuated rocker cams supported at one side of the movable shoe and operating against the same.

879,160. Mounting of Road Wheels for Vehicles. Charles W. Fulton, Paisley, Scotland. Filed May 15, 1905. Serial No. 360,572.

1. In a mounting or suspension for vehicle wheels the combination with a short axle for the wheel and a brocket in which the wheel axle can move vertically, of a cross axle carrying the brackets and non-synchronous springs located between the wheel axle and the bracket and between the bracket and its supporting cross axle to which latter one of the springs is connected and means permitting the wheel axle to move laterally relatively to the vehicle.

879,186. Cushion Tire Wheel. Charles A. Marien, St. Louis, Mo. Filed Feb. 21, 1907. Serial No. 368,535.

1. In avehicle wheel, the combination with a rim, of a tire of resilient material seated thereon, crossbars passing through said tire, retaining members of rigid material engaging the ends of said rods but allowing inward radial movement thereof when the tire is compressed, and retaining plates engaging the outer edges of said members whereby the outward radial movement of said rods is limited.

879,195. Wind Shield or Weather Screen for Motor and Similar Vehicles. Henri S. Samuel. Perth, Scotland. Filed Dec. 21, 1905. Serial No. 292,781.

1. A wind guard for vehicles consisting

of a lower rigid flat portion permanently secured to the vehicle and extending trans-versely thereof and inclined rearwardly in proximity to the steering wheel or handle and an upper portion extending upwardly from the lower portion in front of the driver's face.

879,199. Pneumatic Tire. Baldwin F. Schirmer, Indianapolis, Ind. Filed April 15, 1907. Serial No. 368,221.

1. The combination, with a rim and tire casing, of a ring upon said rim, a series of cylinders set therein at frequent intervals, a common chamber inclosed in said ring for all said cylinders and communicating with the inner ends of said cylinders, a piston in each cylinder, a stem and broadened shoe therefor, a casing against which said shoes are adapted to exert pressure, an ananular chember in said ring, communicat-ing with the outer ends of said cylinders, and having an inlet valve, passages leading from the outer ends of said cylinders to the said aforesaid common chambers and valves in said passages.

879,205. Metal Vehicle Body. Hinsdale Smith and Arthur P. Smith, Springfield, Mass. Filed May 8, 1907. Serial No. 372,-

In an improvement of the class described in combination with the side plates of a vehicle body and the doorsill, a sill facing plate extending from the forward seat to the forward upper edge of the rear

879,312. Elastic Vehicle Tire. Edward L. Perry, Paterson, N. J. Filed June 15, 1907. Serial No. 379,241.

1. An elastic vehicle tire having a plurality of transverse perforations or openings therethrough, and plugs having air vents and adapted to engage said perforations or openings, substantially and for the purpose set forth.

879,349. Strain Distributing Device for Vehicles. James Worthington, Manitowoc, Wis. Filed April 24, 1907. Serial No. 369,-924.

In a vehicle, the combination of the axle bars and a spring supported platform, of a set of intermeshing gear wheels connected with the central portion of the plat-form, and strut rods each pivotally con-nected with one of the gears at a point vertically offset from the axis of gear rotation, said gears being arranged to distribute strains from any one of the strut rods to each of the others, some of said strut rods being connected with the platform.

879,367. Friction Transmission Mechanism for Power Driven Vehicles. James H. Cook, Homer, Mich. Filed April 4, 1907. Serial No. 366,450.

1. Friction transmission mechanism comprising a friction disc constructed in two sections, each of said sections being mov-able independently of the other at right angles to its plane of rotation.

879,380. Multiple Carburetter. Charles R. Greuter, Wilkes-Barre, Pa. Filed Feb. 25, 1907. Sérial No. 359,279.

1. A carburetter comprising a plurality of vaporizers, a single throttle common to the several vaporizers, and separate cut-offs for the oil feed for certain of the va-porizers, said cut-offs being operated by the throttle.

879,414. Steering Gear for Vehicles. David E. Ross, Brookston, Ind., assignor to The Ross Gear and Tool Company, La

Fayette, Ind., a Corporation of Indiana. Filed May 10, 1907. Serial No. 372,854.

1. In a vehicle, ground wheels, a rack, pinion meshing with said rack for moving the same longitudinally, means for turning said rack as it is thus moved, and connections between said rack and said ground wheels whereby the turning movement im-parted to the rack turns the wheels for steering the vehicle.

879,428. Cooling Device for Engines. George Wolke, Jacksonville, Ill., assignor of one-fourth to E. P. Kirby, and onefourth to William K. McLaughlin, Jacksonville, Ill. Filed Aug. 9, 1906. Serial No. 329 919

1. An internal combustion motor com-prising a cylinder, a crank chamber com-municating therewith, a piston arranged in the cylinder, a crank shaft housed in the chamber and connected for operation by the piston, a fluid receiving chamber communicating with the crank chamber, means for controlling the admission of fluid from the crank chamber to the fluid receiving chamber, jet tubes opening into and pro-jecting from the latter, and perforated fluid distributing tubes sustained around the cylinder and open ends to receive the respective jet tubes, the open ends of the distributing tubes being of greater internal diameter than the external diameter of the jet tubes.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

FRANKLIN Type G

A touring-car for the family; a service and pleasure car for contractors, doctors and business men.

A good business man will buy his automobile just as he buys a horse—to fit the service required. You don't buy a draught-horse for family use.

The Franklin Type G Touring Car at \$1,850, and the G runabout at \$1,750 are better suited to family and business use than any large, heavy automobile, besides being far more economical.

Type G is as high grade as the Franklin six-cylinder automobiles that sell for \$4,000. Type G has the same materials and workmanship; only it is smaller. It is the proper size for family and business use; it is large enough for touring; but it costs less to buy and to run.

Type G is a standard automobile in all respects. Over 1,900 are in use. Its light-weight (1,600 pounds), and small engine (16 horsepower) make the up-keep and running expense very low.

We know of a business man who has run a 1907 G touring car for over seven months at a total cost of \$8.53 per month. This cost includes \$3 a month for barn rent, all repair expense, oil, gasoline, washing, etc. Large heavy automobiles cost a good deal more than that for gasoline alone.

Many users of large automobiles would get more mileage and more comfort with this Type G. Almost invariably a man who owns a big machine and a small one, uses the small one the most.

Type G is far cheaper to own than a horse. Its service is unlimited.

Like all the Franklin automobiles, Type G has four full-elliptic springs and a laminated wood frame. This construction and light-weight gives freedom from jolting, and perfect riding qualities, so that Type G can be driven easily, safely and fast over all roads. It will go farther in a day over average American roads than a high-power, hard-riding heavy machine. You can test this for yourself.

Another thing: Type G doesn't wear itself out. Depreciation is slight.

There is no other automobile on the market like the Franklin G. Some may be cheaper to buy, but they are heavier, which makes the owning cost more than offset the price.

There is more satisfactory service—more life and miles in type G than in any automobile ever built for the money.

Investigate this G. See it weighed. Put it to the test.

Write for the catalogue describing Franklin models.

Three Thousand Miles on High Speed

through heavy snow, slush and mud; drifts in Michigan that blocked railroads and at Cincinnati up the famous Indian Hill of 24 per cent. grade with absolutely no slow speed, intermediate speed or reverse, is the record of the Thomas-Detroit Forty "Snow Bird" which is equipped with

TIMKEN Roller Bearing Front and Rear Axles and Transmission Bearings

The E. R. Thomas Detroit Co. write:

"This performance is really marvelous, and the first time that any car has ever attempted a feat of this type. Previously, short runs have been made by various cars with the high speed lever locked in, but the idea of driving a car with nothing but high speed gear, across country in the winter time, has been deemed impossible and never attempted before by any manufacturer. It certainly shows abnormal power in the car and very little loss in the transmission of power from the motor to the wheels. It is a compliment to the TIMKEN COMPANY as well as ourselves."

TIMKEN ROLLER BEARINGS

represent the highest point of perfection as yet attained in the finished steel maker's art in addition to a special knowledge of loads and tractive requirements and how to provide for them.

This tells why the makers of over **60 per cent.** of all high grade American Automobiles and **95 per cent.** of the Trucks made in this country recognize

The Timken Principle Correct and The Timken Quality Supreme

We have important data on loads and haulage of vital interest to everyone who builds or owns a motor car. Sent gladly on request.

The Timken Roller Bearing Axle Company, Canton, Ohio BRANCHES: 10 E. 31st Street, NEW YORK 429 Wabash Avenue, CHICAGO

MOTOR MAKERS

that's what we are. We have made the motors in some of the most successful cars, for Quality before price, and BOTH right.

The "Rutenber" Carburetor

which as motor experts we picked as the best in the world, we are now making and selling.

LET US GIVE YOU INFORMATION.

THE WESTERN MOTOR CO., Logansport, Ind. Manufacturers of "Rutenber" Motors, "Rutenber" Carburetors, and Supplies. Light Soft Gray Iron, Brass and Aluminum Castings.

TRIUMPH GREASE

THE LATEST AND BEST ON THE MARKET

WHAT IS IT LIKE?-It is the only "Spongy" Grease in the world. Its velvety consistency is just heavy enough not to run out and leak. Saves labor in cleaning machine. Will not stick or gum. Not effected by heat or cold. WHY NOT TRY IT?

You will never know its merits until vou do. Why be bothered with a smeared machine, when you can procure a lubricant that will NOT leak out, and lasts LONGER than any other? Those who are on the alert for the BEST, usually get it!

Put up in 5, 10, 25 and 50 lb. cans.

Manufactured only by the

Perfection Grease Company,

South Bend, Ind.

EMPIRE AUTOMOBILE TIRE COMPANY,

TRENTON, N. J.

New York, 148 Chambers St., and Broadway and 73d St.; Boston, 292 Devoushine St.: Buffalo, 724 Main St.; Fobes Auto Supply Co., Portland, Orc.; Fobes Auto Supply Co., Seattle, Wash.; Waite Auto Supply Co., Providence, R. I.; Chicago, 20 La Salle St.; Atlanta, Ga, Dunham Rubber Co.; Denver Auto Goods Co., Denver, Colo.; Penn Auto Supply Co., Philadelphia, Pa.; Savell Rubber Co., Jacksonville, Fla.

MORGAN & WRIGHT TIRES

than for other kinds,

there might be a reason why some motorists (particularly those who are buying their first car) would accept other kinds in order to save <u>first cost</u>; but it is an entirely different proposition when a motorist can get the kind of service Morgan & Wright tires are known to give at the price of other brands.

John H. Gibson, Assistant Manager Gibson Coal Mining Co., Des Moines, has "gone thru the mill" in tire experience, but has discovered (as a good many motorists are discovering) that tires are not all alike. He says, under date of February 7:—

"It is not very often that the owner of an automobile has anything complimentary to say about tires. I have one of your tires on my Thomas Flyer which has given 7,400 miles of service, with no repairs whatever, certainly an unexpected and very flattering result. I think, in justice to the makers of such a tire, that congratulations are due you."

You can have the same kind of service by using the same kind of tires, and without extra cost.

Wico Plugs Exclusive Features of Solar Lamps

(1) The Internal Method of Screw Assembling

All Solar Headlights when assembled are riveted by internal screws. This exclusive feature produces a perfectly smooth exterior surface, permitting ease of cleaning. This is a very important feature for the owner to consider when purchasing a motor lamp.

This important detail and all others explained fully in our new 1908 catalog. Write for copy.

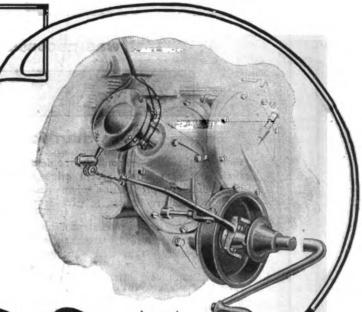

BADGER BRASS MANUFACTURING CO.

Two Factories
KENOSHA, WIS.
436 Eleventh Ave., NEW YORK

The Matter of Safety

is often overlooked by automobile designers and results are often serious, sometimes disastrous. In the

Sprak Retarde MMI

this is considered an important detail and safety of operator and car is given equal consideration.

A leading feature is the automatic spark retarder, by means of which engaging the starting crank positively retards the spark, thus removing all danger from premature ignition.

As to safety of the car, there is no greater source of trouble than loosened bolts or nuts.

In the Rambler this is prevented by the use of Rambler lock nuts that positively cannot come loose, or by castellated nuts locked in place by cotter pins.

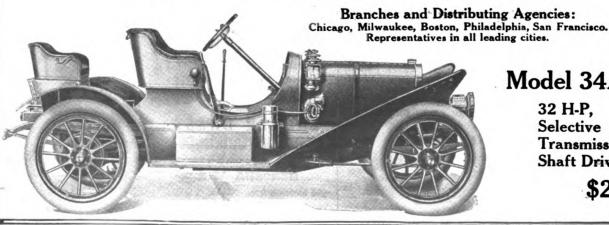

These are in themselves but small things, but it is such attention to little things that makes the Rambler

The Car of Steady Service

Our catalog tells the story. Write for it today or see our nearest representative.

ADVISES MAKERS TO CO-OPERATE

American Consular Representative Says It's

Best Way to Open South America—

Brazil as an Example.

"Special representatives sent here by the more progressive and aggressive manufacturers to study the field find that there is nowhere in Brazil a distinctively American house handling American manufactured products." savs Vice-Consul General Slechta in a report to the Department of Commerce and Labor. "There are two or three dealers in agricultural machinery in Rio de Janeiro who give preference to certain lines of American goods. Almost all others are concerns with German, British, or French connections, which give decided preference to goods originating in their respective countries. It is easy to see just what this means. In the matter of automobiles, for example, there are in Rio de Janeiro four well-equipped garages with repair facilities, but in not one of them can an American machine receive the same attention as a French, German, or English car. This is due, in a great measure, to unfamiliarity with American automobiles.

"During the past year not less than eight large motor car manufacturers in the United States have had special agents in Brazil, but as yet not one of them has been successful in establishing an agency that does any business for the manufacturer. None of the concerns which have taken agencies of American automobiles are in a position to establish a repair shop and garage facilities, because such a course involves an outlay that the present demand for any particular make of American car does not warrant. As long as these conditions continue Brazilians will buy other than American machines. It is not reasonable to expect individual manufacturers to establish branch houses in Rio de Janeiro, but certainly there are enough American cars of various makes to warrant the establishment of a repair shop and garage especially for American cars.

"This, it would seem, might be made a 'legitimate function of the Association of Licensed Automobile Manufacturers. Perhaps for the first six months such an establishment would not pay expenses, but it ought to be the means of securing a foothold for American built motor cars in a market which is certain to demand an increasing share of attention on the part of the foreign departments of American automobile factories. The association should establish a permanent exposition of American cars and, in connection therewith, make it their object to work with each member of the organization to the end of securing proper local agents in other Brazilian

Pope Receivers Make a Full Report.

Albert I. Pope and George A. Yule, receivers of the Pope Mfg. Co., have filed in the Superior Court at Hartford, Conn., a statement of the business transacted by them as receivers from August 14, 1907, to and including March 31, of this year. It shows that they received \$880,496.04 and disbursed \$822,952.34, leaving a balance of \$77,791.25. In addition to the financial statement the receivers make a general report of the condition at the factory.

Brock Returns to the Autocar.

Marcus I. Brock is back at his old post, that of sales manager of the Autocar Co., Ardmore, Pa. He filled that office previous to his engagement as assistant general manager of the Association of Licensed Automobile Manufacturers.

Bartlett Joins the Long Arm System.

E. J. Bartlett has been appointed chief engineer of the Long Arm System Co., Cleveland, Ohio. Previously he was attached to the engineering staff of the Electric Vehicle Co.

V. E. Minnich, director of the selling division of the H. H. Franklin Mfg. Co., has resigned that office.

A. M. C. M. A. ASSUME WHOLE SHOW

Acts Promptly After Withdrawal of Automobile Club—January Dates Probable
—Road Show "Postponed."

The Automobile Club of America having more or less gracefully bowed itself out of the show business, its former not wholly silent partner, the American Motor Car Manufacturers' Association, lost no time in very cheerfully assuming the whole burden. This was done at a meeting of the association's show committee in New York on Tuesday last, when it was announced that Grand Central Palace, New York, already had been leased and again will be the scene of the "independent," or open show, as the promoters prefer that it be styled.

The dates for the show have not been definitely settled, but it is practically assured that January dates will be selected. The Association had its fill of so-called "early shows." There is not a voice in favor of another event in October.

The show committee of the Motor and Accessory Manufacturers, Inc., was in conference with the A. M. C. M. A. body and will be apportioned a block of space, as heretofore. The show will be, however, an open one in every sense, and despite the glowing reports of the exclusive importers' "frost" in Madison Square Garden in January last, it is probable that all of the importers who are not allied with the Association of Licensed Automobile Manufacturers will be found in the Palace show.

In the diplomatic language of one of the officials, the traveling trans-continental which the A. M. C. M. A. contemplated, has been "postponed, but not abandoned." but the expense and obstacles were found to be so great that probably the last has been heard of it. It was found that the cost would exceed \$110,000; no reduction of fares being obtainable. The association itself also would be required to conduct the dining car service.

IN THE RETAIL WORLD.

Lombard & Wood, a new firm, has located on Columbus avenue, Boston, to deal in second hand cars. They have taken the office formerly occupied by E. S. Breed.

The Twenty-first street Garage Co. has been incorporated in Toledo, Ohio. George L. Craig, formerly of the Craig-Toledo Automobile Co., is the chief stockholder.

C. S. Henshaw has opened headquarters at 288 Columbus avenue, Boston, as New England representative for the Haynes. He occupied the same premises several years ago.

Priest & Dinneen, Cheyenne, Wyo., resently opened a new garage in that city, where they sell and let cars. The firm operates under the name of the Cheyenne Rubber Tire Co.

George K. and Harry E. Rapp are to open D. S. Spencer's shop at Oyster River, Saybrook, Conn.. as a repair shop. They will equip it fully for the work of repairing automobiles, boats and engines.

Percy H. Johnson has leased the City Hall garage at 9 and 11 Hill street, Newark, N. J., and will make a specialty of storing automobiles. He will operate it in connection with his place at 265 Halsey street.

The Livingston-Ramsdell Motor Car Co. has leased part of the De Camp building at 234 Halsey street, Newark, N. J., and will conduct the agency for the Palmer & Singer cars. Arthur Newton will be sales manager.

The Pelen Automobile Co. has been formed at Logansport, Ind., and has located a garage in South Champion street. William Pelen and Anson Thornton compose the company which will handle the Jackson cars.

Charles F. Cleveland has opened a garage at 225 West Broadway, Princeton, Ind., where he carries a stock of accessories and supplies. He deals in automobiles and bicycles, and makes repairs on both classes of vehicles.

Janesville Wis., is to have a garage on West Washington street. Frank Millman and E. J. Manning are fitting up a livery barn building for the purpose. They will conduct a repair business in connection with the garage.

Prophetstown, Ill., is to have a first class automobile establishment, comprising a salesroom, garage and repair shop. P. C. Kempster has begun the erection of a brick building, about 50x36 feet, which will be pushed to early completion.

James Crotty and John P. Viola, of Great Barrington, Mass, constituting the firm of Crotty & Viola, have purchased the automobile business conducted by Charles S. Taylor in a building which they own on Railroad street. The business is to be managed by Ellis Holbrook.

The first garage at Superior, Wis., is to be established by the Russell-Rhodes Co., who will handle the Franklin cars. It will

be located at 912 Ogden avenue. The members of the company are A. M. Russell, H. C. Russell and A. L. Rhodes, all of whom are familiar with automobile work. They contemplate establishing later a garage in Duluth, Wis.

Bar Harbor, Me., is to have a larger garage this summer than the one conducted last season by F. P. Pray & Son. The same firm will provide it. The location is outside the limit within which motor cars are prohibited. Mr. Pray has made arrangements to meet cars at Hull's Cove, taking the owners across by carriage or launch after the cars have been housed.

Robert Gugin, the Franklin dealer at Vancouver, B. C., has formed a co-partnership with H. S. Rolston. Rolston is secretary, treasurer and manager of the Walworth-Rolston Co., dealers in vehicles and farm implements. The new co-partnership will operate under the name of the Franklin Automobile Agency and will handle Franklins exclusively. A new show room will be opened in the building of the Walworth-Rolston Co.

E. O. Hall & Son, Honolulu, H. I., have purchased the garage of the Associated Garage Co., Ltd. The building is located on the corner of two main streets and is 60x 200 feet; it is of brick and concrete and modern in every respect. The Associated Garage Co. was organized originally by a number of enthusiastic automobilists of Honolulu, but the Garage organization as a mutual benefit society did not prove a financial success and the owners were glad to sell out.

J. W. Mason, Newark agent for the Maxwell and the Stoddard-Dayton cars, has opened new salesrooms at 350 and 352 Halsey street. The garage, considered one of the most complete in New Jersey, was formally opened on Saturday afternoon, 18th inst., with a brass band and refreshments for the entertainment of the many invited guests. The new building has a frontage of 45 feet and a depth of 100.

Important Decision Affecting Garagemen.

Even when a car is accepted as "dead" storage, the garageman is responsible not merely for its safe keeping, but for a deterioration due to neglect, is the substance of a decision handed down this week by Justice Weil, in the municipal court for the Fifth District, New York. It grew out of the suit of Miss Gertrude G. Rothschild against the Empire State Garage to recover damages for loss of parts of a battery and deterioration to tires of her electric victoria. In her complaint she asserted that she left her car at the garage on dead storage in December, 1906, and that when she sent for it the next summer she found the tires in bad condition from not having been "jacked up" and because the machine had not been kept in a dry, light place; in addition, certain fittings had disappeared. She recovered judgment for \$113 and costs.

THE WEEK'S INCORPORATIONS.

Wilmington, Del.—Maxwell Taxameter Co., of Wilmington, under Delaware laws, with \$500,000 capital.

Cleveland, Ill.—Cleveland Motor Car Co.. under Illinois laws, with \$300,000 capital. Corporator—R. Bacon, Jr.. Chicago, Ill.

Denver, Col.—Pavelka-Winter Auto Co.. The, under Colorado laws, with \$2,500 capital. Corporators—W. C. Faucett, E. A. Pavelka, and Karl Winter.

Denver, Col.—Donaldson Motor Car Co. The, under Colorado laws, with \$10,000 capital. Corporators—Arthur S. Donaldson. Elmer T. Soden, and Samuel R. Steinmetz.

Lockport, N. Y.—Lockport Rubber Works, under New York laws, with \$300,000 capital. Corporators—J. E. Davis and Harry M. Wood, Erie, Pa.; M. Steele, Lockport, N. Y.

Boston, Mass.—Blair-Forth Mfg. Co., under Massachusetts laws, with \$100,000 capital; automobiles. Corporators—C. Forth. president, Winthrop, Mass.; W. Blair, treasurer, Newton, Mass.

Detroit, Mich.—John H. Brady Auto Co.. The, under Michigan laws, with \$10,000 capital; to buy sell, repair, and store automobiles. Corporators—John H. Brady, Albert L. Stephens, Martin Borgman.

Jackson, Tenn.—Southern Motor Works. The, under Tennessee laws, with \$50,000 capital. Corporators—Atwell Thompson, W. H. Collier, Exile Burkitt, L. L. Curtiss. and W. E. McClamrock.

Brooklyn, N. Y.—Electric Welding Co., under New York laws, with \$24,000 capital. Corporators—Ove Lange, 260 Eighty-third street; Christian Nielsen, 209 Ninth street; Herman O. Amundsen, 269 Eighty-third street, Brooklyn, N. Y.

New York City, N. Y.—St. Louis Car Automobile Co., under New York laws. with \$20,000 capital. Corporators—John F. Valieant, 5 Nassau street; Louis A. Hopkins, 1706 Broadway, New York City, N. Y.; Warner S. McCall, St. Louis, Mo.

New York City, N. Y.—Uptodate Mfg. Co., under New York laws, with \$25,000 capital; manufacturing automobiles, motors. etc. Corporators—C. S. Goodfellow, Rockaway Beach, N. Y.; J. R. Conkey. New York City, N. Y.; J. Van Vliet, Baltimore. Md.

New York City, N. Y.—Hexter Taxameter Cab Co., under New York laws, with \$100,000 capital. Corporators—Ralph Hexter, 207 West 120th street; Thomas F. McDermott, 121 West Eighty-ninth street, New York City, N. Y.; George F. R. Snowden, 363-A Fourteenth street, Brooklyn, N. Y.

New York City, N. Y.—Terry, Tench & Proctor Tunneling Machine Co., The, under New York laws, with \$1,500.000 capital; to manufacture tunneling machinery, engines, motors, cars, trucks, etc. Corporators—J. J. Banks, Denver, Col.; A. S. Luria, E. E. Morris, New York City, N. Y.

TO RESTRICT RIGHTS IN PATENTS

Congressional Bill to Amend Laws and Prohibit Sale or Lease to Combinations

—Cancellation the Penalty.

Representative Campbell has introduced a bill into Congress to suspend the patent and copyright laws of the United States when a patent or copyright or any article or product protected by patent or copyright is owned, leased, or used by any trust or monopoly in violation of any law in restraint of trade by providing that whenever any letters patent issued by the United States, or any article, commodity, compound, device, mechanical appliance, or machine protected by patent; or any article protected by copyright issued by the United States is owned, leased, used, or controlled by any individual, firm, association, syndicate, corporation, or combination which is engaged in any vocation, business, or enterprise in violation of any law of Congress or of any State, prohibiting, restricting, or regulating trusts, monopolies, or combinations which operate in restraint of trade, the right to any protection under the patent or copyright laws of the United States shall cease and terminate.

It would be the duty of the Attorney-General or any district attorney to institute suits in law or equity when the facts should warrant such suit or suits in any U. S. circuit court where the patent or copyright is owned, leased, used, or controlled, or the articles or products referred to are manufactured, used, produced, or sold in violation of the Act.

It would further provide that the final judgment or finding of the U. S. Circuit Court that any letters patent or copyright of any article, compound, commodity. device, mechanical appliance, machine, or any other work protected by letters patent or by copyright is owned, leased, used or controlled by any individual, firm, association, syndicate, corporation, or combination engaged in any vocation, business, or enterprise, in violation of any law of Congress, or of the State prohibiting, restraining, or controlling trusts, monopolies, or combinations which operate in restraint of trade shall operate as a forfeiture or cancellation of such letters patent or copyright. The leasing of patents is common and the effect of the law would be far reaching.

Weidner Succeeds as Amateur Sleuth.

George Weidner, who represents the Warner Instrument Co. in Detroit, Mich., has developed the "detective instinct." About three weeks ago the Warner branch in Detroit, at 239 Jefferson avenue, was broken into and over \$1,200 worth of Auto-Meters and connections were stolen. Weidner suspected Walter Morris, a negro. of having committed the theft, but he couldn't

see how the colored fellow was going to get rid of the property, but when Morris made a trip to Cleveland, Ohio, he was trailed and arrested there and brought back to Detroit. In the sweat box he confessed that he had stolen the instruments and sold them to one Robert Wachman, of the Wachman Motor Mfg. Co., but when Wachman was brought to police headquarters he denied all knowledge of the matter. Finally he became anxious and sent for his attorneys. They came and advised Wachman to "fess up" upon being granted immunity from arrest. This he did and the speed indicators were found where he had buried them securely wrapped in hay in the rear of another store. Wachman bought the entire lot of stolen goods at a less than "bargain price." He paid the negro thief but

Mercedes Liabilities and Assets.

Schedules in bankruptcy of the Mercedes Import Co., New York, which was backed by "Ice King" Charles W. Morse, but which failed several weeks since, show liabilities of \$228,755, and nominal assets of \$261,514, consisting of cash on hand, \$2,395; cash on deposit, \$134,777, of which \$132,995 is with C. L. Charley of Paris, and the balance in banks here; notes, \$16,715; accounts, \$43,-195; stock of automobiles, parts, etc., \$32,-517; machinery, \$1,102, and office furniture and fixtures \$813. Among the creditors are the National Bank of North America, \$81,979, of which \$4,500 is secured. The bank and Henri Lehman both claim to be owners of a note of \$25,000 of the company to C. L. Charley for money loaned; First National Bank of Bath, Me., \$18,500 on a note of the company to C. L. Charley for money loaned, and the bank and Henri Lehman both claim to be owners of the note; Garfield National Bank and C. W. Morse, \$25,000 on a note of the company to Mr. Morse for money loaned and by him discounted at the bank; A. Brann, \$12,500 on a note of the company for money loaned and pledged to the National Bank of North America as collateral; Mr. Brann and John S. Primrose each own half of the note; R. E. Fulton, \$6.300, money loaned; Smith & Mabley, \$31,754. The following Paris creditors are on contingent liabilities: C. L. Charley, \$12,233, for commissions; Rothschild & Son, \$10,480; Kellner & Son, \$5,-242, and Grummer, \$10,493, for automobiles ordered but not taken.

Yule Goes from Lamps to Golf Balls.

W. H. Yule, son of George A. Yule, one of the receivers of the Pope Mfg. Co., and who has been active in the affairs of the Badger Brass Mfg. Co., of which he is a director, has tendered his resignation to accept the management of the golf ball department of F. F. Goodrich Co. Yule long has been prominent in golf affairs, having won among other things, the Wisconsin State championship, and the call of the greens proved too strong to be resisted.

MORE "SUBSTITUTION EXPOSED"

Splitdorf Gets Complaints About Coils and Unearths the Cause—Inferior Imitations Sold as Genuine.

While almost all automobilists realize the necessity of making replacements with parts made by the manufacturer of the original article, it is found that it always is not the simple matter one would think to obtain the genuine. A case in point is well illustrated by the recent experience of C. F. Splitdorf, whose ignition specialties are so well known as to lead to the conclusion that substitution for them would be almost impossible.

For several weeks Splitdorf had been receiving complaints that his coils were not giving satisfaction. Investigation showed that the complainants, in every instance, had used the coils for a long time, with entire satisfaction for many months, but later with results that were far from satisfactory to the owners. A peculiar feature of the complaints was in the fact that they were made only by persons living in a certain part of the west.

Several coils were sent to the factory where they were carefully examined and it was found that the contact screws and springs were the cause of the trouble. For a long time the experts were puzzled, for though it quickly was learned that the contact points on the screws and springs were made of german silver instead of iridio-platinum, it was not understood at the factory how this could be as no german silver had ever been used there for this purpose. Finally it was found that the entire screw and spring had been made by some irresponsible manufacturer who so closely imitated the genuine articles that even the Splitdorf people were fooled.

Following out this clue, the maker of the counterfit parts was soon discovered and notified that unless he stopped the manufacture of the imitations he would be proceeded against in the courts. As an additional precaution the originals now are all stamped with the Splitdorf name.

German silver is almost totally useless as a contact point, as the heat from the sparks quickly destroy it and when destroyed the results to be obtained from the coil are very poor.

Duryea Brings Forth the "Buggyaut."

Charles E. Duryea will style his new motor buggy the "Duryea Buggyaut." It will be built in the old Duryea Power Co.'s factory at Reading, Pa. The motor is of the two cycle type air cooled and of 10-12 horse-power. Duryea's invention, described in his own words, consists of "grooved friction driving rollers, a few necessary fittings, a common buggy and a motor." It will sell for \$750.

It's a Heap of Satisfaction

-Maxwell owners say—to drive a car you're not ashamed of in any company—one that, like a wellbred woman, however meagre her purse, is yet at home in the best society.

Now there be cars which, tho sold for only a little less than Maxwells, yet have such a shoddy appearance—such a "dinky" aspect—such a "cheap" look—the owners always feel like apologizing for driving them—tho a slim purse is surely no disgrace.

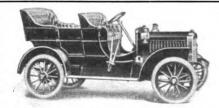

What is it gives to such cars the cheap look? It's difficult to define. Yet it's there—you can't escape it any more than you can fail to notice illbreeding, however rich the garb with which it is clothed.

Next time you go to the Country Club, the golf links, anywhere that Wealth and Culture meet, note how many Maxwell cars and how few other lowpriced ones are parked among the Foreign Nobility and the High Caste American machines.

And the Maxwells will look as if they belonged there; the others like a country bumpkin in a drawing-room—well meaning but out of place.

It's this indefinable something—this outward appearance that somehow tells of quality inherentbred-in-the-bone construction—has given Maxwells the title "The Aristocrats of Moderate Priced Cars."

Maxwell cars are made in six models; ranging in price from \$825 to \$3000 Perhaps the most popular model this year is the four-cylinder, 24-28 horse-power family touring car at \$1750—same chassis equipped with "roadster" type body, seating two in rearsame price.

Model "D"-\$1750

The catalog tells all about all of them—and it's free.

INCOMPARABLE

THE SERVICE

WHITE WINS FORT GEORGE HILL-CLIMB

A 30 horse-power White Steamer scored the fastest tim in the great hill-climb in New York on April 9th, making the ascent of Fort George Hill from a standing start in 321/2 seconds, as compared with 36 seconds, scored by the fastest of the gasoline cars. All makes, domestic and foreign, claiming special hillclimbing ability, were represented in this contest.

The White has won so many important hillclimbs that its superiority in this style of competition is no longer questioned. The reasons for this superiority may be stated as follows:

- 1. The White engine, when called upon to do so, can probably develop more power than any other type.
- 2. It is certain that a larger percentage of the power of the engine is delivered at the rear wheels in the White than in any other machine. This was proven with mathematical exactness in the great English contest at South Harting, held for the purpose of determining this point.
- 3. The question of proper gearing for different gradients is not a vital one in the case of the White, as the car adapts itself perfectly to varying conditions. In other words, the unique flexibility of the White is of considerable advantage in hill-climbing contests, just as it is in touring or in city use.

Clearing of the Dashboard.

One token which shows that the every day owner has come to regard his motor car as a utility rather than as a play toy is evidenced by the tendency to get away from the use of gimcracks adorning the dashboard and other conspicuous parts of the machine. Formerly it was the rule rather than the exception for the automobilist to fit out his car with every imaginable sort of a contrivance running from an electric cigar lighter to a barometer. But this disposition to equip with every conceivable novelty or accessory that may be devised by the imaginative brain for the purpose of enticing the dollars from the pockets of the unwary, has given way to the sensible idea of utilizing only those things which may be of real service. In arriving at this determination, the private owner has undoubtedly been influenced by the action of many of the more prominent

manufacturers who have ceased to so furnish the dashboards of their cars that they created the impression of an accessory exhibit at an automobile show.

Instead of coil, oiler, clock, switch, etc., the dashboard of a modern car contains only a sight feed glass and a switch; even the coil has been placed out of sight on many cars and where formerly brass trimmings abounded they have now been largely done away with or have been exchanged for oxydized embellishments which look as well and require less attention. While there still is and always will be a demand for those accessories which add to the comfort or convenience of the occupants, the day has passed when a host of useless ornaments will be thought necessary as adjuncts of a properly equipped car. Signaling devices for limousines, and speed indicators for all cars have proven their value and become necessities rather than luxuries, but the days of thermometers and barometers, grade meters and various other gimcracks as fittings for the dashboard has passed, and with the passing comes the evidence of a sane conclusion that the automobile is a vehicle of utility rather than a means for ostentatious display.

The Used Car Situation.

With the rapid increase in the number of cars in use, or at least extant, the problem of dealing with the used, otherwise second-hand car, is daily becoming more complicated. It is an unquestionable fact that the number of purchases of new cars involving the exchange of used cars, either directly or incidentally, is on the increase. Evolution of marketing conditions has bred a most perplexing situation for the agent and dealer out of this natural state of affairs and one which is likely to become even more vexing as competition grows keener.

Many agents make it a rule to take no cars in trade, except those of the lines they themselves handle regularly; others make no trades at all; still others, fearful of losing business by such a policy, give way to various exceptions and take on cars which appear to be readily saleable; again, others are glad to trade on any basis so long as there is a look-in for speculative profit. The problem in this connection is to determine rightly how to dispose of these exchanges which, strictly speaking, are nothing more nor less than collateral covering the price of the sale. Obviously, the sooner the second-hand machine is

cleared from the floor the sooner the full benefit of the sale is realized. This is an important point, especially to the agent dealing on small capital. But how to accomplish this, and how to reduce to its lowest terms the "risk" which is involved in any second-hand proposition, is entirely another matter.

Broadly speaking, but two courses are open to the agent who finds himself in this dilemma. Either he may hold the machine and attempt to accomplish its sale himself, or he may turn it over straightway to a second-hand dealer accepting in return that individual's cautious appraisement of its value in return. In the first instance, the costs of repairs and overhauling, storage, selling, and the incidental charges, not to mention the delay in closing the account of the original sale, must fall on his own head. In the second alternative, he must suffer a loss which is supposed to compensate for these factors, but which in addition robs him of the possible profit of a "lucky" sale as well as that which goes to the pocket of the second-hand man. Furthermore, in the latter instance, he places himself in the unpleasant position of catering directly to a class of dealers who are openly regarded as a thorn in the flesh and a disturbing as well as demoralizing factor in the trade.

The second-hand dealer is a specialist in his own line; he has nothing at stake in the way of reputation, as a rule; he recognizes no conflict of scruples in recommending one car or another to the possible customer; and generally speaking he is able to command a better price than the "legitimate" dealer, who is compelled to subordinate all other business to the main chance of selling for the maker or makers he represents. In this way the second-hand dealer furnishes a natural and happy outlet for cars taken in trade, and in most cases, the exchange of a new for an old car is accomplished with better all-around economy when the regular agent acts as a clearing house for the trade than when the original owner sells direct to the secondhand dealer and subsequently buys outright of the agent.

Were it possible to bridle the dealer in used machines to confine him to that line exclusively and prevent him from acquiring bankrupt stocks to sell at cut prices, and otherwise practicing the tactics of the shyster, his recognition would be more cordial and his support more genuine and legiti-

mate. As it is he is a poser and his influence makes the second-hand problem a knotty puzzle.

Possibilities of Producer Gas.

Producer gas, though employed to a considerable extent in large industrial plants where it is essential to reduce the cost of power as far as possible, has not generally come to be considered as a possibility in connection with the propulsion of motor vehicles. The description of certain tests with a form of producer especially designed for automobile use, as recorded in another column, is, therefore, of no little interest, because producer gas is essentially an economical product.

The producer is a refined form of gas generator to which is added a scrubber of some sort, capable of removing only the coarser impurities from the gas, and so delivering it to the engine-made to order, as it were. It is practically a carburetter for solid fuels. By its use, the combustion of solid fuel is divided. The earlier stages are devoted to the heating of the fuel to a point where it gives off the combustible vapors which under ordinary circumstances would yield to combustion. The process stops short of that point, however, because of the lack of a sufficient supply of oxygen to carry it on. The second stage involves the combustion and expansion of those gases together with a much greater volume of air in the cylinder of the ordinary internal combustion motor. From the economic standpoint a greater proportion of energy can be obtained from a given amount of fuel by the use of a producer and gas engine than by transforming the same basic supply into the latent energy of steam and using it expansively in an engine. Compared with the power obtainable from liquid fuel by the simple process of vaporization and aeration, it is still cheaper when measured in terms of net cost.

Because of the necessary weight and size of the apparatus, the use of producer gas for automobile purposes will probably be limited to the purposes of the commercial vehicle. That it is possible to construct small plants on a fairly economical scale has been proved by the success of the Capitaine system, as applied to motor boats abroad, as well as by the case more in point in this connection. As a problem, the use of this system involves the design of a compact and efficient form of generator, which

THE MOTOR WORLD

considering the fact that the suction producer, the type suited to this class of work was only introduced on a commercial scale in 1895, is by no means a sinecure.

In order to work out a suitable design, the builder must begin at the beginning and proceed along lines which are largely emempirical and based on personal experience, to a great extent. Therefore progress cannot be rapid. At the same time, the possibilities attendant upon the direct use of coke or anthracite without the complication of the steam boiler and its auxiliaries. is too attractive to be ignored. With the probable future use of heavy road trains employing multiple-unit power plants and working in competition with all other modes of freight transportation, the question of fuel cost will be regarded in a very different light from that of the present time. In such a case, the fact that the cost of traction per horsepower may be more than cut in half-which is a conservative estimatemakes the inducement to attack the matter of producer design for this particular purpose a most alluring one.

Contributing Cause of Accidents.

While neither excuse nor palliation can be offered for the automobile driver who is a party to or the cause of an accident that occurs while his car is traveling at a high rate of speed, there are conditions under which an accident may occur when the driver is far less culpable than appearances seem to indicate. It long has been recognized that there is a clearly defined limit to the sustained nervous energy of which mankind is capable.

Legislatures have found it necessary, for the protection of public safety, to make laws governing the number of hours of duty which may be demanded of railroad employes, and others, whose labor had to do with the preservation of the lives of travelers. And these laws have been passed and have been enforced to the end that no man, whose mental and physical activity has been diminished by the abnormal strain of long, continued application to labor that saps his nervous energy, should be in charge of anything-locomotive, trolley car or switch, where the safety of mankind would be jeopardized by his inability to handle emergencies that in a normal mental and physical condition would not present serious problems.

Unfortunately the owner of a motor car too seldom realizes that there is a limita-

COMING EVENTS

April 24, Westchester county, N. Y.—Stock chassis race for Briarcliff trophy.

April 28, Norristown, Pa.—Norristown Automobile Club's endurance run to Lancaster, Reading and return.

April 29, 30 and May 1, Detroit, Mich.—Detroit Automobile Dealers' Association's three days' reliability run to Saginaw, Kalamazoo and return.

May 15, Algonquin, Ill.—Chicago Motor Club's annual hill climbs on Perry and Phillips hills.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 20, Indianapolis, Ind.—Indianapolis Automobile Trade Association's 160 miles sealed bonnet endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's third annual hill climbing contest up Giant's Despair.

May 30, Baltimore, Md.—Motor Car Racing Association's race meet at Pimlico track.

May 30, Cleveland, Ohio—Cleveland Automobile Club's second annual hill climbing contest.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

July 9, Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

tion of the powers of his chauffeur. The latter often finds that the duties devolving upon him are in part to make the early morning trip to the owner's office, then to return to take madame on a shopping tour, followed by a ride through parks and drives in the afternoon, the theatre at night and then a ball or dinner, which keeps him from his bed until the early morning hours, a brief time for sleep and then to repeat with slight variation the same thing.

Obviously human nature can stand this strain only for a very short time. Then when mentally unstrung and physically tired, an emergency arises, the chauffeur is not capable of the clear, quick thought and action necessary to avoid the accident, and he is blamed for carelessness when in truth the condemnation should be visited upon the head of the employer who, considering only his own desires, demands of another that which no man is capable of giving. It is a contributing cause of accident too often unsuspected and rarely, if ever, remarked.

TROUBLES BESET BRIARCLIFF RACE

Threatened Hold-up Causes Promoters to Scurry for Cash—More Preliminary Accidents on the Course.

Despite its near approach, the race for the Briarcliff trophy, which is due to take place over 32 miles of crooked roads in Westchester county, New York to-morrow (Friday) morning, is still somewhat "up in the air. In fact, there were inside whispers yesterday afternoon that the race might be postponed.

State Engineer Frederick Skene has got his dander up and has sprung an eleventh hour holdup of the promoters by threatening to stop the race unless sufficient cash is deposited with him at once to cover the cost of damage that the race will do to the roads.

There is a statute which provides that before a contest is run over the State highways a sum of \$200 for every mile used first must be deposited with the State engineer to be used to repair any damage caused by the race.

It appears that in making preparations for the race some one carried on negotiations with a subordinate in Skene's office, instead of with the State engineer himself, and the latter got mad. He determined to show the Briarcliff promoters "who's who," and he is doing it in a manner not calculated to smooth the tempers of Chiefs Moore and Morrell.

When the ultimatum came from Skene that unless the money was deposited in his office he would order the sheriff to stop the race, Moore and Morrell began to "throw fits." They scurried about and secured a bond for \$4,500 from a bonding company, but Skene said only cash would be acceptable. After considerable persuation, the promoters induced Skene to come to New York Tuesday night, and talk it over. A long session resulted, but Skene remained obdurate and as the promoters have need for all the cash available, they are much distressed. At present the deadlock is still on, but expected to be broken at any moment. So far as can be learned, the Automobile Manufacturers' Committee. which is the style employed by Messrs. Morrell and Moore, has not been incorporated, nor has any bond been executed indemnifying the promoters and participants from accident, so that apparently each individual will be responsible for any accident or damage that may result.

If present arrangements are carried out the 22 cars will start from in front of the grandstand at Briarcliff Manor, at one minute intervals, beginning at 4:45 a. m., in the following order:

Piston
No. Driver. Car. Displacement.
1 Paul Sartori, 40 Bianchi...... 82.52

2 Emanual Cedrino, 60 Fiat	95.0336
3 Herbert Lytle, 50 Apperson	103.86
4 Louis Strang, 50 Isotta	102.38
5 F. W. Leland, 30 Stearns	90.72
6 E. H. Parker, 60 Fiat	05.00
7 Harry Michener, Lozier	86.59
8 Guy W. Vaughn, 30 Stearns	90.728
9 Ralph Mulford, Lozier	86.59
10 Dan Murphy, 35 Maja	58.92
11 Al Poole, 50 Isotta	102.38
12 Montague Roberts, 60 Thomas.	95.0334
13 Barney Oldfield, 30 Stearns	90.7 2 8
14 Maurice Bernin, 35-45 Renault	86.59
15 Geo. Robertson, 50 Panhard	103.864
16 Wm. H. Hilliard, 40 Hol-Tan	72.3 8
17 A. L. Campbell, 40-45 Allen-King	78.54
18 Julien Block, 35-45 Renault	86.59
19 Hugh N. Harding, 50 Isotta	102.38
20 Louis Bergdoll, 60 Benz	103.00
21 J. Seymour, 50 Simplex	103.83
22 Wm. Watson, 50 Simplex	103.83
This week has produced a hull m	arket in

This week has produced a bull market in Westchester county. Eggs and milk have risen in value, proportionate to the increase in rates for window seats in farm houses fronting the course, and it is said on good authority that Walter W. Law, who is giving the trophy that is to be raced for, has sent all his cows up into the back country and has staked his erstwhile pasture lots into pleasing sites for bungalows and country estates. He confidently expects the race will prove a profitable real estate booster and will draw bigger crowds than all the free Sunday excursions he could run in a year.

The task of oiling the course was completed early this week but that treatment has not rendered it less dangerous. Despite two or three minor messages here and there with a steam road roller there yet remains many bumps.

The course was officially measured this week and was found to be 32.6 miles in length instead of 30 miles, so that ten laps of the race will make 326 miles, instead of 300 miles. There has been some talk of reducing the distance to eight laps, but no official announcement to that effect has been made. As the Motor World has stated many times, it is doubtful if a more dangerous course could have been picked out than the Briarcliff course. It is somewhat straighter than a corkscrew, but not much. There is a variance as to the number of turns on its sinuous 30 miles. Louis Bergdoll (Benz) says he has counted 117 turns, while Frank Leland (Stearns) places the

The question naturally arises, will human endurance withstand such a strain as that necessary to cover ten laps of this dangerfraught course? Eliminating all chances of nerves becoming frazzled-and be it understood that every driver that goes into the race to-morrow morning will have plenty of need of all the nerve he can musterwill the drivers be able to withstand the physical strain? In practice not one of the 22 entrants has covered more than three laps at a time, and this has been agente enough to add to their weariness. It is conceded that there are at least 70 turns where gears will have to be shifted, and as each change requires two operations of the

6 arm, making at least 1,500 in all, it is a safe bet that the winner will not feel much like shaking hands after the finish.

In view of the dangerous nature of the course efforts are being made to insure a thorough ambulance service during the progress of the race. The course has been dotted with telephones not more than a mile apart, and a hospital corps of eight surgeons in that many automobiles equipped especially for the purpose, besides eight nurses, will be stationed at the most dangerous points on the course.

Just what point of the course offers the most chance for possibilities is difficult to determine. There is not one single stretch in the 30 miles circuit that can be described as a straight mile run, and the curves at certain points are more dangerous than the worst on any circuit over which an automobile race has ever been run, not even excepting the Ardennes circuit. One of the points where the drivers will be forced to slow down unless they care to risk their lives and all chances of winning the race is at the southern part of the oval near Valhalla. The turn here is more than a curve-it is a right angle, and one of the places the drivers refer to as "sporty." Another bad place is at Armonk, where there is a bend in the road in the form of a V and less than 30 yards in the entire length. The northern end of the circuit from Pine Bridge to Mount Kisco abounds possibly in unpleasant eventualities. The road is continuously serpentine, with rocks abutting dangerously near the track, with trees, telegraph poles, stone walls, and parapets threatening at every corner. At Mount Kisco there will be a control, the only one on the course, and drivers will have to take ten minutes to pass over about a half mile of road. Catds will be stamped upon entering and leaving, and these dropped in a locked box on the dashboard.

Three bad accidents already have occurred this week. On Tuesday morning J. B. Ryall, who was "feeling" the course in a runabout, in which were three persons, ran off the Saw Mill bridge near Eastview and plunged into the creek. Ryall sustained a compound fracture of the ankle of his already damaged left leg, and the passengers escaped with slight injuries. The following morning A. C. Campbell, driving the Allen-Kingston, ran off the bridge at Armonk. His jaw was broken and it is not thought he will be able to start. George Robertson (Panhard) ditched his car at Wampus Lake, but escaped with bruises.

How the promoters intend to keep the expected crowds from encroaching on the already too narrow course was made known this week. There will be about 1,000 notional guardsmen, "volunteered" from two New York regiments. It is stated that the "volunteers" will not carry State guns, but what they will carry, or with what real authority they will be vested is not made clear. It is stated also that these "volunteers" will cost the race promoters \$7,000.

OFF THE MAIN LINE

NEW YORK-PARIS "RACERS" AT SEA

Automobiles Race Across the Pacific on Steamships—Godard Gives up and Sells the Motobloc Car.

Three steamers—the Aki Maru, the Glen Logan and the Shawmut—are now engaged in the great trans-Pacific ocean race, the second stage of the New York-Paris automobile "race." The Aki Maru is due at Yokahama, Japan, on April 29, and the Shawmut on May 10. The Glen Logan, which goes directly to Vladivostok, is due at that port on May 9th. The Aki Maru left Seattle on April 14th, the Glen Logan on April 20th, and the Shawmut on April 21st, which is sufficient foreword to lead up to how the steamships get into an automobile "race" around the world.

When the Thomas car discovered that the Alaskan trails were impassible because of the melting snows, after having journeyed to Valdez, St. Chaffray, in charge of the De Dion car, then at Seattle, decided to take advantage of the information goty by the crew of the American car, so he hade all arrangements to embark forthwith on the Aki Maru for Yokahama. With him went the Zust car and a part of its crew. The latiturere not in favor of taking advantage of the American entrant in this manner, but as St. Chaffray was determined, there was nothing for the Italians to do but to keep the French car in sight, so they embarked also on the Aki Maru.

Schuester, with the Thomas car, expected to sail from Seattle on the Glen Logan, direct for Vladivostok, but on account of difficulty in having his Russian passports vised by a Russian consul, as there was none in Seattle, the nearest being at San Francisco, he had to wait over a day and take the Shawmut to Yokahama. The passports will be vised there. Lieutenant Koeppen, of the German Protos, which intends to continue as a non-contestant, was geing to accompany the Thomas, but on account of the delay to the latter, the German decided to take the first boat to Vladivostok and there await the American car.

Lieutenant Koeppen's decision was brought about by his own difficulty. At Chicago he had engaged R. C. Schneider to drive the car, but at Seattle Schneider decided to go back to the Windy City, leaving Koeppen alone. The lieutenant wired to Berlin for two mechanics and they will be shipped across the Siberian railroad to join the car at Vladivostok.

It is the intention of the French De Dion, Italian Zust and American Thomas cars to proceed across Japan from Yokahama to Tsuruga by road, and there ship to Vladivostok. The French and Italian cars will have a lead of about eleven days after arriving in Siberia, but it is understood that the Italian crew has been ordered to await

the American car and proceed with it across the Siberian frontier. This report is strengthened by the fact that Sirtori, driver of the Italian car, did not go with it on the Aki Maru, but remained in Seattle to arrange for the shipment of some parts. He sailed for Vladivostok on the Glen Logan, which is due to arrive there on May 9.

Charles Godard, who started from New York with the French Motobloc car in the great New York-Paris scramble, gave up the contest and shipped his car by rail to San Francisco, is in additional trouble. After Godard left New York word was received here that he was wanted by the Paris police on a charge of having obtained money under false pretenses during the Pekin-Paris "race" last year. When Godard reached San Francisco he sold the car and its outfit to a Nevada mining man for \$1,650, it is stated. According to advices from San Francisco Godard was about to depart for dear Paris, when he was arrested by customs officials. They wanted the Frenchman to explain why he sold the car without the formality of having taken it out of bond, as it had been accorded free entry to this country, upon the condition that it simply was going through. What the customs officials intend to do with Godard is not stated.

Motorist with a 100,000 Miles Record.

It is believed that the first full authenticated instance of a man piling up a record of 100,000 miles has been found in E. C. Andrews, of the Liberty Mills Co., Nashville, Tenn. This record was not made with one car, but a peculiar feature of the matter is that the registering of the mileage was done on one Warner Auto-Meter, which was changed from car to car as the seasons advanced. Another case, not so well authenticated, is a record of 75,000 miles made by a Chicago man, who, however, does not care to have his name mentioned as he is not positive whether or not he missed one repetition of his odometer. A Warner Auto-Meter is on his car also.

Omaha Dreams of an Automobile Track

At the suggestion of U. S. Renne, of Smithland, Iowa, whoever he may be, a majority of Omaha's dealers have signified their intention of contributing funds for the purpose of repairing the old mile track at the fairgrounds with the newly organized National Automobile Racing Association, about which little is known except that it has its offices in Cleveland. The "Nara" expects to create a circuit of tracks for automobile racing, and Omaha is on the list.

First Entry for Hower's "Blind Run."

J. W. Maguire, of Boston, has made the first entry for Chairman F. B. Hower's "blind run" for the Glidden trophy, which starts from Buffalo on July 9. Maguire entered a Pierce-Arrow, naming C. R. Teaboldt as the driver.

BY "WIRELESS" FROM WERNER

Lone New York-Paris "Racer," Long Lost,
Turns up in a Dream—Grapevine
News in French Paper.

How fast the little germ of news may propagate when left to itself in its travels over the world is difficult to realize until the return mail brings in the "revised version" of some story, long grown stale. This is particularly true where patriotic journalism and trade interests combine to stimulate the creation of a piece of intelligence as startling as, for instance, that the longforgotten Werner, which a New York newspaper despatched to Paris from Printinghouse square a day ahead of the "regular" New York-Paris "racers," and which crossed a good part of the continent on a railroad train, had now assumed the leading position and is at present braving the northern terrors of the Klondike on the course oroginally laid down for the main expedition.

For this statement the Parisian "l'Auto" is responsible. In its issue of April 2, an item appeared which was substantially as follows:

"The New York-Paris race has entered upon a thrilling phase to which the veritably epic progress of the French Werner has contributed no small amount of honor. The American journals, notably the World, state that Drieghe and Hohman, who are conducting it, have aroused for themselves and their car the admiration of the New York masses.

"This is easy to comprehend, for the formidable duel which this car has forced upon the American Thomas car has resulted to its advantage. The Thomas, as a matter of fact has already embarked from San Francisco to rejoin them at Seattle, while our compatriots have stuck to the course with a courage worthy of the knights of old. They maintain that the cars are made to run on land, and not to achieve their progress on the deck of a ship. Furthermore, you should see the enthusiasm which awaits them. Not simply have they reached Seattle-where a prize of 25,000 francs was offered-before the Thomas, but within the hour they have cabled that with the difficult passage of Alaska before it, the car of "John" (Thomas) renounced the over-passage of the Klondike and embarked directly for Vladivostok. The Werner did not hesitate to brave the course and remains alone at the head, more courageous and valiant than ever.

"This tickles our self-esteem all the more agreeably because the Americans are particularly interested in the Werner. Another advice states further that everywhere catalogs are in demand, and that their car is the object of examination which is not that of curiosity only, but of admiration."

PARK BOARD CLINGS TO POWER?

New York Commissioners Vote to Fight Against Enactment of the Automobile Bill Pending at Albany.

The New York State Automobile Association's bill introduced by Assemblyman Merritt, relating to highway control, now pending in the legislature at Albany, is to be opposed by the park commissioners of New York City. Commissioners Smith of Manhattan, Berry of the Bronx, and Kennedy of Brooklyn, held a conference on Friday, 17th inst., and adopted a resolution stating that the Park Board is opposed to the measure, which, if made a law, the commissioners say, will deprive them of the control of park highways, thereby permitting practically unlimited speed, the entrance to the parks of businness motor vehicles and the use of tire chains, which, they declare, tear up the macadam roads.

The commissioners say that since the enactment of a Park ordinance December 5, 1907, which prevented the further use of tire chains or other non-skidding devices in the parks and highways under their supervision, the automobilists have been awaiting a chance to get a bill through the Legislature which would take away the control the commissioners now have over the park highways. The corporation counsel will be requested to fight the bill.

The measure had been discussed in the Assembly at Albany on the previous Monday night and New York members joined with rural members in opposing it. The section of the bill which prohibits local authorities from enacting ordinances regulating the speed of automobiles was obnoxious to the New Yorkers, who made a plea for "home rule." Assemblyman Wagner said that it was a dangerous piece of legislation, and would give automobilists the right to run their machines at almost any rate of speed that seemed reasonable and proper. As a result of rural protests the bill was amended in committee on the 15th inst., so as to give rural communities the right to fix rates of speed in their respective precincts.

To further complicate the situation and despite the fact that the legislature is to adjourn next week, another automobile bill has been introduced in the lower house by Assemblyman Voss. This measure seeks to provide for the appointment by the Governor, of a commission of three persons to serve for five years with no compensation other than "their necessary traveling and other expenses." The commission may appoint a counsel at \$4,000 a year and a secretary at \$3,000. The bill further provides for registration certificates of vehicles on payment of \$3; the fee required in case of previous registration is to be \$2. Speed of 30 miles per hour may be maintained upon any public highway, but when approaching any bridge, dam, curve or descent it will be unlawful to exceed a rate of speed faster than 10 miles per hour. The bill includes provisions for warning of approach and for stopping on signal by a person in charge of a restive or frightened animal as long as shall be reasonably necessary to prevent accident and insure the safety of others.

When Charles Thaddeus Terry, counsel of the American Automobile Association, was questioned by a representative of the Motor World as to the possible result of the park board's opposition, he replied:

"The stand taken by the park board is too absurd to merit serious consideration. It is the stand they have taken before and been defeated in. All fair minded people, whether automobilists or not, realize how absolutely untenable the board's attitude is. If each little local organization throughout the State is to have the power to make laws and ordinances governing the traffic of their respective balliwicks, no man could drive fifty miles without violating a law, some law that he never heard of and couldn't easily find out about."

There was a tone of disgust in Mr. Terry's voice as he continued: "Two or three years ago, it will be remembered, the park board adopted a rule forbidding automobiles to use the parks at all. The public clamor that immediately arose compelled them to rescind their action. The legislature is familiar with the methods and ideas of the park board and I greatly doubt if their opposition in this matter will accomplish anything."

When his attention was called to the Voss bill Mr. Terry said that it was a negligible quantity, it had been introduced too late to be passed, and was fathered by some one or some organization at present undiscovered.

Whistles to Halt Motorists in Newark.

A new regulation concerning mounted policemen and automobilists has been put into effect by the Newark (N. J.) Police Board. It is worth memorizing, for a knowledge of it may save fines, and unnecessary police annoyance. Hereafter, instead of shouting at automobilists who they consider are going faster than the prescribed limits, the mounted policeman will use whistles. Automobilists are expected to stop or slow down their cars whenever they hear the signal.

Buffalo Adopts Drip Pan Ordinance.

The city of Buffalo has passed an ordinance requiring automobile owners to put drip pans on their automobiles. Owners whose automobiles drip oil on the streets are liable to a fine of \$50.

Minneapolis has a new automobile ordinance which includes a provision that automobiles shall not be kept standing on the business streets for a longer time that 20 minutes.

GOOD ROADS GOSPEL FOR GRANCERS

Automobile Club Offers Helpful Suggestions in a Booklet—The Damage that is Done by Water.

There are several ways of viewing the cause of good roads and several ways of treating the country-dwellers who chiefly are responsible for the well or ill conditioned state of the highways. To return hostility for their hostile or non-cimmital attitude is natural enough, but the friendly policy is better, especially where is is accompanied by direct tender of good advice and aid on the part of the motorists who always appreciate good roads, and who sometimes are held responsible to a certain extent for their destruction. This plan has been adopted by the Lima (Ohio) Automobile Club and a few helpful suggestions given to the farmers in a little brochure on road etiquette which is has issued.

"The most deadly enemy to good roads is water," is one of the points brought out. "Try and keep in mind this one fundamental thought, that water does more damage to roads than all other agencies put together. If it were not for water a road once good would always be good. Think about this every time you drive over a road. Speak about it to everybody you meet. Keep insisting that more attention be given to the subject of keeping water from standing in puddles along the road. It stands in pools only when there are holes for it to go into. No holes no water. No water. no mud. One shovelful of gravel will fill a small hole, and if all the small holes are kept filled, there will never be any large holes.

"You can fill a thousand small holes for what it will cost to fill ten large ones. In one case you will have a perfect road all the time. In the other case you never have a good one. It is either holes or fresh stone the year round. But after a road has been properly built it is an easy matter to keep it so by watching for the small depressions which always apppear in a new road, where little pools of water will accumulate after a rain. They look so very innocent and harmless at first; but the enemy-wateris there and at work. It softens the ground and along comes a loaded team and forces out the water and some dirt with it-just a little-but the depression is made a little deeper and will hold a little more water than before; and the big wagon comes along and again 'swishes' out more dirt with the water than it did the first time.

"Wherever a drain-tile has been laid across a road you will always find a raise or a hole, even though it has been in for two or three years. Everybody sees it and takes the 'jolt,' but nobody fixes it, although it might be done in ten minutes, simply because it is nobody's business."

GASOLENE VS. ALCOHOL AS FUEL

Experiments at Franklin Factory Result in Verdict for the Former—Relative Economy a Decisive Factor.

As the result of extensive experiments that have been carried on with the alcohol motor in the laboratories at the Franklin factory in Syracuse, N. Y., the Franklin people conclude that the results do not warrant the belief that there will be an immediate demand for the alcohol motor. They say their experiments show that even if alcohol and gasolene could be purchased at the same price per gallon, the gasolene motor would be the more economical. In other words, with the two fuels at the same price, it would be cheaper to use gasolene. This is because there is a great deal more energy in a given amount of gasolene than there is in a given amount of alcohol, and up to date there is no way known by which the handicap of an alcohol motor can be overcome.

There is another very serious drawback to the use of alcohol as against the use of gasolene, they say. The motor can use practically any amount and not suffer. In the gasolene motor the "mixture" must be right or the motor does not work well. If the gasolene is used too freely and the "mixture" becomes too rich the operator knows it at once by the loss of power, etc. This is not true with alcohol. For example: If the alcohol motor was running at the rate of three miles to one gallon of alcohol and some little change in the adjustment or conditions caused the alcohol to be fed faster, the motor might consume a gallon to a mile and the operator would not know it. Therefore, under all conditions known to-day the Franklin people conclude that there is no immediate future for the alcohol motor, but they do believe that it is of sufficient importance to merit further experimenting with the possibility that the problem of providing an available substitute for gasolene as fuel for the internal combustion motor can finally be solved.

Necessity for Ample Room for Testing.

When first testing the results of adjustments which have been made on the clutch or transmission it is advisable to have plenty of room for operation before connecting the transmission to the power plant. An incident recently occurred which emphasizes the importance of this precaution and which narrowly escaped a sensational climax.

A car equipped with a planetary transmission was given a thorough overhauling. The last thing to be adjusted was the transmission, and when this was done the engine was started and the mechanic, who had seated himself in the car, threw in the clutch. It held all right, but instead of

taking hold gradually and permitting the car to slowly overcome its inertia, the vehicle bounded forward with startling suddenness, and with disastrous results.

The test was made on the upper floor of the garage which was equipped as a machine shop. The car was standing directly in front of and only about three feet away from a drill press, and as it bounded forward it struck the latter with sufficient force to wreck it, at the same time destroying its own radiator, which received the full force of the impact. The mechanic was fortunate, however, in having the car stopped by the drill press, for that alone was between the car and a large window that extended from the ceiling to the floor. Had the press not been there the car would have gone through the window and dropped 20 feet to the ground. Obviously had this occurred the incident would have had a tragic ending. But the accident would have been avoided if the simple precaution of having plenty of room for testing had been

Selecting the Proper Spark Plug.

While the same principle is found in all spark plugs, it does not follow that all plugs are equally desirable for all motors. The selection of the style of plug which is best suited for a certain cylinder should depend almost entirely on the construction of the cylinder in which it is to be used. The best results will be obtained from a plug the firing points of which are well down in the explosion chamber.

As some motors are constructed with a large amount of metal in the cylinder head or an especially generous water jacket, it is obvious that plugs with short bases will not enter well into the explosion chamber. But as most manufacturers of spark plugs make a variety of designs it usually is possible to obtain the style wanted in whatever make of plug the consumer is best satisfied with.

Commutator Trouble and Its Remedy.

A source of trouble that is difficult to locate is sometimes found in the commutator. When the firing in a cylinder becomes erratic, the cause of it may lie in the condition of the springs behind the commutator brushes. After the brushes have been worn down by long usage it often will be discovered that the springs which are necessary to cause the contact between the brushes and the armature are not long enough to serve this purpose, with the result that a good contact is not made when the armature is revolving rapidly. Yet when a test is made with the engine not in motion the results are entirely satisfactorv.

No definite rule can be laid down that will show when this condition exists, but if all the other parts of the ignition apparatus are in order, time and trouble may be saved by lengthening the springs so that a firm contact is secured.

HARMLESSNESS OF BATTERY FLUID

Startling Ablutions in Presence of Supreme Court Convince Jurors—Verdict for Defendants in Damage Suit.

By plunging their hands in the dilute solution of sulphuric acid which is used in the batteries that drive motor cabs, and by rubbing that fluid upon their faces, William H. Palmer, Jr., secretary of the New York Transportation Co., and Mr. Wing, counsel for the company, disproved in the New York Supreme Court a few days ago, the general impression that battery fluid is strong enough to burn and disfigure the human body.

This somewhat spectacular demonstration was made during the trial of a damage suit brought against the New York Transportation Co. by a boy who had been caught in a collision between a street car and one of the company's electric cabs. The force of the collision had knocked the batteries from the cab and broke them. The boy's lawyer claimed that his client had been knocked down and had rolled in the puddle of electrolyte fluid which had formed after the breaking of the batteries. He claimed, further, that the electrolyte had burned the boy so severely on the head and face that the burns had not healed for six months after the accident occurred.

As soon as this allegation was made, both Mr. Wing and Mr. Palmer jumped to their feet and volunteered to wash their hands in the same kind of acid which the plaintiff's lawyer claimed had burned the boy. They also agreed to have it rubbed on their faces. The boy's lawyer dared them to carry out the proposed demonstration, and with a readiness that probably was wholly unexpected by the challenger they accepted his challenge.

With the consent of the judge, a battery of the same type used on the electric vehicle which had been in the collision was then brought in the court room, and the acid emptied from it into a basin.

Mr. Wing and Mr. Palmer then washed their hands in the electrolyte fluid and rubbed a generous quantity of it on their faces. Mr. Wing, to further prove the harmlessness of the fluid, actually swallowed some of it.

The jury was apparently so well satisfied with this demonstration of the inability of electrolyte to inflict the injuries which the plaintiff's lawyer alleged that it brought in a verdict for the company after being out only fifteen minutes.

It was brought out in court that electrolyte is a dilute solution of sulphuric acid in water, and is perfectly harmless so far as any burning effect upon the human body is concerned, unless copious quantities of it be permitted to remain upon the body for a considerable length of time.

EXPENSES OF COMMERCIAL CARS

Comparative Statistics of Operating Cost in Scheduled Service—Their Bearing on Systems of Propulsion.

In this country the operation of motor vehicles for commercial purposes has been carried on in such a desultory fashion up to this time that but little is known of the proper average working costs as credited to the finer subdivisions of the sum total. In England and on the Continent, on the other hand, three or four years of continuous operation of omnibuses and trucks by companies handling relatively large numbers of these vehicles, has furnished a broad basis of cost accounting and cost comparison, which is of the greatest value to those who have access to them.

According to good authority, the outcome of a prolonged and careful study of such statistics has led to the disheartening conclusion that the systems of propulsion in present use are, for the most part of too expensive a sort to be worked with proper economy. In other words, according to this opinion, "It is necessary that an entirely different type of vehicle to those now most generally used must be introduced," in order to secure the proper ratio of net earning to investment.

This opinion-and in the light of the conclusions offered it cannot be regarded otherwise-formed the gist of a paper on the "development of petrol-electric systems and their application to heavy road vehicles," read before the Society of Road Traction Engineers, recently by P. Frost-Smith and W. A. Stevens. Though bearing directly on the use of the "mixed" system of propulsion, or the electric transmission, as it is more aptly termed, the treatment of the subject has a general bearing on the use of commercial vehicles in scheduled service in England, which is of no little interest from the statistical point of view.

Referring to the results of long-continued observation the authors remark that "the general cost of running is much too high, . . . and this high cost of operation is due to several causes, including abuse of the vehicle by reason of bad driving and carelessness, and the necessity for a very heavy night staff—about 1.5 men per vehicle, excluding washers. The only items in which economy can be effected in motor 'bus operation are: depreciation, running costs, maintenance costs, oil and grease."

The costs per mile quoted are derived from the experience of the company with which the authors are connected, and are claimed to be representative of average London practice. "They relate," it is explained, "to vehicles which have been in apperation for nearly 3 years, and they there-

THE MOTOR WORLD

fore give a fair indication of the maintenance necessary after the first year's working." The figures are given in American equivalents:

Day running	0.54

24.24

"The petrol-electric problem has, for some years past, received much attention and careful consideration," the authors continue, "and many designers' names here deserve mention, viz., Patten, of America, in 1890; the Germain system in Belgium; the Hart direct-current system, in 1903; the Fischer, in America; the Lohner-Porsche, in Austria; the Stevens double-ended motor; the Carolan; the Krieger, Pieper, Farrow, Mercedes-Simplex, Kuttner, Lehwess and Clark, British Thompson-Houston. Greenwood and Batley, and last, but not least, the Hart and Durtnall, all of which types differ considerably in their application and other details, to the system in which we are interested.

"We can only deal generally, and briefly with the foregoing systems, which are broadly divided under three headings, viz., the accumulator system, the direct-current system, and the alternating-current system. The prospects, we think, are of the worst for those interested in the accumulator 'system, by which we mean a motor or motors driven from a storage battery which is carried upon the vehicle. Traction battery sets have never yet met with success, and it is only necessary to look into the records of the Blackpool Tramways Co., the Birmingham Central Tramways Co., the London Motor Cab Co., and early American efforts in this direction, to condemn the system. Accumulators of the Planté type were as efficient 15 years ago as they are to-day, and the only improvements shown are in mechanical details. We are of opinion that for the systems which employ a direct current unit, in conjunction with secondary batteries, the prospects are also bad, chiefly on account of the heavy wear and tear on the battery. As regards the purely petrolelectric combination, we are of opinion that the electric unit applied heretofore, by a double reduction gear, or by single motor on to a live axle, or to replace only the gear box, and used only as a starter, does not warrant its existence. The Mercedes-Simplex system, which is a direct application of electric motors, built into the road wheels, appears to us to be entirely wrong owing to the very low speed, the limited size of the motors, and the necessarily low efficiency. We have mentioned the Mercedes-Simplex system last, as the object they aim at is in our opinion, the correct one, viz., the direct application of the electric motors to the road wheels, but still, this must be done in a manner that shall be mechanical and efficient; this we have endeavored to do, and we hope successfully."

The Hallford system, which is discussed at some length in the text, was described in these columns not long ago. Its most striking feature from the purely mechanical point of view, is the method of mounting the motors, of which there are two, which consists in hanging them upon the outside of the frame at either side of the vehicle, and driving the rear wheels independently through special cardan shaft and bevel gear groups. Speed control of the vehicle is accomplished mainly by altering the excitation of the dynamo, so that variations in traction are secured with a minimum waste of energy.

This system has proved conducive to a number of economies, of which the paper continues:

"An engine such as we have employed may be safely taken to cost no more than 1/4d. (1/2 cent) per mile, on the very low basis of 30,000 miles run per annum; this mileage is more likely to approach 40,000 miles than the figure given, and at the time of writing this paper the engine has cost nothing.

"On the same basis as the above the frame is estimated to cost 1/4d., and the back axle the same sum. This latter unit was stripped after a 6,000 mile run, for examination, and we wish you to accept our assurance that there was no visible signs of wear. Gears, ball bearings, and other wearing parts were perfect, and the only anxiety we have regarding this unit is the possible carelessness, or want of attention, on the part of the management, or other employes. The electrical unit has shown us that with a suitably designed dynamo and motors, the maintenance cost would be extremely low, and certainly not more than 1/4 d. per mile, though we really think that this figure, low as it is, would eventually be considerably reduced."

The saving possible with a vehicle of this description is revealed by the following table, which is quoted in American coin:

Cen	its. Cents.
Depreciation, insurance, etc 4.4	13 3.66

PACKARD IDEAS IN A NEW TRUCK

Approved Features of Touring Car Construction Adapted to Heavy Vehicles
—Simple Details of the Chassis.

Although it is admittedly "bad practice" to utilize parts intended for use in pleasure cars in vehicles answering to purely commercial requirements, there is a world of good sense in applying the ideas which have been worked out successfully in one class of machines, to those of the other sort so long as they are properly adapted. Thus in the new Packard three-ton truck, which is being introduced by the Packard Motor Car

pounds, is geared to run at speeds up to 12 miles an hour. It has 144-inch wheel base; 68-inch tread; wheels, 34 and 36 inches in diameter, front and rear, shod with solid tires, which are single in front, and twin in the rear. Semi-elliptical springs are used—45 and 50 inches long, respectively, and or massive form. The main frame is 39 inches in width and 148 inches long back of the driver's seat. It is built up of channel steel with cold riveted joints.

The motor, which is located under a shapely bonnet in front of the seat, is of the quadruple, vertical pattern, with cylinders cast in pairs and with water jackets integral. Its dimensions are 4½ by 5 inches, bore and stroke. The regular Packard type, automatic carburetter is employed,

PACKARD THREE-TON TRUCK

Co., Detroit, Mich., a form of counter shaft is employed which closely parallels the rear axle "bridge" construction combined with the change gear arrangement, which has for so long been a marked and approved feature of Packard touring car construction. This form is carried out even to the extent of taking up the driving resistances by means of a long torque rod, instead of by the lugs supporting the gear box, as is more commonly done under similar conditions.

The details of the machine have been worked out with great care and show the effect of the long period of incubation which has preluded its introduction. Its general arrangement is characteristically simple and in accordance with current practice, many of the refinements not ordinarily found in commercial vehicles being apparent in its make-up. The loading platform is 6 feet by 12 feet 4 inches, thus giving 74 square feet net of useful space back of the driver's seat. The floor is 411/2 inches above the ground, and in the standard construction is supplied with a regular crib body. Other types of body are equally applicable, however, and are obtainable on special requisition.

The chassis, which weighs about 5.000

and governed automatically. Ignition is by jump spark, furnished by the Eisemann magneto, gear driven, supplemented by storage batteries for reserve and starting purposes.

Transmission is by propeller shaft from the expanding ring clutch to the three speed sliding change gear, and from the counter shaft to the wheels, by side chains. The foot brakes are applied on large drums located on the counter shaft ends, just inside the driving sprockets, while the emergency set acts on the wheels themselves through internal drums. The mechanism of control comprises the usual pedal and lever appliances, and is handily placed on the right side of the vehicle.

Parcels Delivery Experiment in Mexico.

What is considered a significant beginning in the exploitation of the commercial motor vehicle in Mexico was inaugurated the first of this month, when the Mexican Railroad undertook a series of trials to determine the relative costs of parcels delivery by motor and animal traction. The initial equipment consists of a single 22 horsepower British built machine, imported for the purpose.

GAS PRODUCER FOR MOTOR CARS

Practical Experiment in Fuel Production for Heavy Vehicles—Specifications of a Recent Foreign Device.

What used to be regarded as a more or less remote possibility in connection with motor propulsion, has been brought into a state of tangible reality by a Scotch firm which has developed a form of gas producer suitable for use on motor vehicles of the heavier class. While the direct utilization of producer gas in motors of the internal combustion type is known to be more economical than the use of liquid fuels, the stumbling block has always been the cumbersome nature of the producer itself, which in point of bulk and weight tended to parallel the ordinary steam boiler. The special type of producer which has been developed by the firm in question, the Automobile Gas Producer Syndicate, of Glasgow, is surprisingly light and compact, and as applied to a machine of the char-abanc type, equivalent to the American "rubber-neck wagon," has proved even more satisfactory than had been expected at the outset.

According to the Scientific American, in which an account of the trials recently appeared, the vehicle closely resembles the sight seeing and transfer machines which are extensively used in Great Britain at the present time. The motor is of the ordinary gasolene type, and develops 40 horsepower when run on gasolene, and 30 when run on producer gas. It is placed in the usual forward position underneath the bonnet and is unaltered except that the compression is raised to 115 pounds. The normal running speed is 900 revolutions per minute, and transmission to the rear driving wheels is by the ordinary form of change speed gear and double side chains.

"The gas producer is placed immediately behind the engine, between the latter and the dashboard," says the authority mentioned. "It extends the full width of the chassis, and is about 18 inches deep, while it extends from just below the top level of the dashboard to within about 12 inches of the ground. The grate area is about 12 square inches, and the fuel rests on a specially designed grid, upon which the water is sprayed in the center through a four-spray nozzle.

"On a level with the fuel grid is a small air-tight door secured in position by means of a crossbar and clamping screw, by means of which the fire is lighted and the clinker and ash removed. The upper part of the producer, which forms practically an integral part thereof, is occupied by the fuel hopper. This is charged through small openings in the top rendered air tight by means of special cone joints, it only being necessary to open these once a day—in the

morning before starting out-since a single charge is sufficient for a full day's work. The air blast is forced into the bottom of the producer by means of a powerful rotary blower driven by chain from the engine shaft, while it is also fitted with a handoperating device for the purpose of setting the fire going after lighting. In order to control the generation of the gas, as well as to reduce the temperature and dispense with the steam jet that is generally utilized in such plants for this purpose, variation in the quantity of fine pulverized water fed through the nozzle mentioned above is effected by a special pump. This is accomplished by an ingenious arrangement. There is a novel rotary plunger pump fitted and driven from the engine by a lay shaft, by which the water is forced from the tank into the center of the fire. This pump works automatically and has the most delicate adjustment, so that the temperature of the fire and the extent of the gasification is carried out according to the requirements of the engine independently of the driver, the pump practically fulfilling the function of a governor.

"From the producer bottom the gas escapes into a pipe conveying it downward through the hopper to a coke scrubber suspended beneath the frame of the vehicle; thence it passes through a second pipe into the mixing chamber, where it is mixed with thé right proportion of air for combustion, the entry of the air being controlled through adjustable cocks, one of which is carried to the dashboard, so that the driver can supplement or decrease the air supply for this purpose. Thence the mixture passes to the throttle valve, controlled from the steering column, from which it is induced into the combustion heads of the engine cylinders through the inlet valves.'

The vehicle is controlled in the ordinary manner, the generation of gas being carried on automatically except for the injection of water into the producer, which is regulated by a small hand lever mounted on the steering column beside the spark and throttle levers. The hopper has a capacity for 640 pounds of fuel, and the fire is started with about 3 pounds of charcoal. Within 5 minutes of the time of starting the fire, the car is ready to use and thereafter no further attention need be given the producer.

After a year's use, the vehicle was recently subjected to a series of exhaustive tests to determine its economy and study the possibility of improving certain details of construction. In these trials, anthracite "pearls" were substituted for the coke, which had been the fuel originally intended, and with perfectly satisfactory results.

"The distance covered upon the latest of these tests," to continue the quotation, "was 40 miles, at an average speed of from 10 to 11 miles per hour. For the run 145 pounds of fuel were used, the vehicle weighing with its passengers 4.9 tons. This represents a fuel consumption of approximate-

ly 0.74 pound of anthracite per ton mile. The coal cost \$3.54 per ton, so that the fuel running costs represented about 0.12 cents per ton mile, or about 24 cents for the 40-mile journey.

"The same vehicle working under precisely similar conditions with gasolene fuel cost about 1.34 cents per ton mile, the spirit at the time costing 28 cents per gallon. Under these circumstances it will be realized that running expenses with producer gas are considerably lower than with gasolene. in this instance a saving of 1.22 cents per ton-mile being effected. It must be pointed out, moreover, that the working conditions were not the most favorable to economical efficiency, since no modification was made in the movement or diameter of the inlet valves, which were of the type usually adopted in general motor practice. More satisfactory and economical consumption results would be available were the valves mechanically operated, and with about twice the inlet area to the explosion chamber. At the same time the results have been sufficiently conclusive to prove the suitability of the system to all-round automobile work, and various vehicles of this type are now in course of construction."

Gun to Indicate Deflation of Tire.

Of all devices ever invented for the purpose of warning the automobile driver of the presence of a deflated tire, none, perhaps exceeds in point of simple ingenuity the contrivance recently placed on the French market by Loitard Freres, a Parisian firm. Briefly it is nothing more nor less than a tiny alarm gun affixed to the rim of the wheel, and arranged to be fired automatically when the tire pressure falls below a certain predetermined amount.

A tube, not unlike the filling tube, is mounted in the rim, and carries at its outer end a small metallic cartridge held in place by means of a screw cap. A small chamber just back of this contains the firing pin, which is spring actuated, and held in the "cocked" position by an extension in the form of a slotted tube, which engages a groove in the edge of the rim, where it is clamped in place by a small plug mounted on a butterfly flap, similar to those carried by the ordinary security bolts. So soon as the tire pressure falls to the danger point. the force holding the plug in place is relaxed sufficiently to release the firing pin and explode the powder charge contained in the cartridge, thus giving effective warning of the deflation.

Steering Gear at Top of Control Column.

To all intents and purposes there should be no advantage in placing the steering gear at the head of the control column instead of at the foot as is customarily done. The designer of the Critchley Norris steam car—a British product—however, has found several points in favor of the arrangement which has been incorporated on these machines in a particularly novel manner. The gear itself is of the worm and nut type. the slide which is threaded internally to receive the steering post, being mounted in the housing of the column directly beneath the wheel. Attached to it by means of a gudgeon pin is a long connecting link, extending through to the base of the column and there attached to one arm of a bell-crank lever, the other extremity of which is linked to the right hand steering knuckle by means of the usual drag link. The most striking feature of the system is that the entire gear may be dismounted without disturbing the dash or its supports in any way and even without dismounting the column.

Making Putty Hold in Body Finish.

At first thought it would appear quite as easy to putty the surface of a motor car body and make the plastic material stay in place as it is to perform the same service for the ordinary carriage. Such is not the case however, and the problem is a far more difficult one than would appear to be the case.

"Vehicle painters," remarked a practical member of the craft, "have long recognized the difficulty of making putty stay securely in place upon surfaces exposed to severe forms of vibration, and they resort to various expedients to circumvent the dislodeing power of the oscillation and vibration incident to the use of such surfaces. As a rule, the automobile is subjected to a service that tries the surface at all points, and to an extent foreign to the service of horsepropelled vehicles. To make the putty stay in place better upon such surfaces is the painter's burden to-day. Not a few workmen have succeeded in overcoming the difficulty in using a little raw linseed oil, say, a gill to four pounds of putty, in the putty as it is mixed. This serves to impart additional binding power to the putty, and, given a little extra time in which to dry, the pigment is pretty certain to hold."

Suspension with Cushioned Springs.

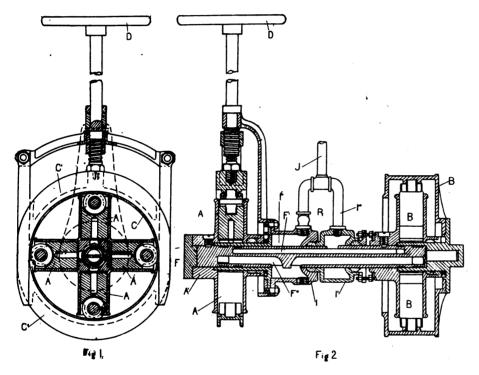

Under the name of the Simplex shock absorber, a British firm has just introduced a system of suspension which follows remarkably close in the footsteps of an Amerilan invention of several years ago, in which the springs were supported on pneumatic cushions fixed to the axle perches. In the Simplex system the springs are seated on a rectangular, gun-metal box which has a loosely fitting bottom or piston. carried by the axle and fixed rigidly in place. Between the piston and the shell of the box is a rubber bag of substantially the same section and contour, which is inflated to a pressure of some 10 to 15 pounds. Unlike the device, referred to, however, this arrangement is not intended to eliminate the use of inflated tires, but merely serves the purpose of relieving the springs themselves of the minor shocks and vibration of the vehicle. In this sense, it acts as a shock absorber, literally, and supplements the action of the tires.

HYDRAULIC CLUTCH DEVELOPMENT

Two Novel Methods of Attack—How the Same Result May be Attained in Various Ways.

Despite a number of very attractive features, the hydraulic clutch still remains largely a matter of prospect. Numerous different patterns have been designed, and from time to time no small amount of attention has been called to the subject, particularly in the columns of the foreign press. Nevertheless, up to this time no type of hydraulic transmission, either clutch pure and simple, or clutch and

The details of construction of the Hele-Shaw clutch are shown in Figs. 1 and 2 accompanying. As is apparent, the small plungers, A', in the cylinders, A, are arranged to travel back and forth along the diameters of the clutch, and are constrained in their motion by the guide ring, C, against the inside of which small rollers mounted on the outer ends of the plungers bear. The guide ring is composed of two semi-circular yokes with tangential extensions, which may be moved together or apart by means of the controller, D. As this is turned, the screw and nut mechanism above the clutch proper causes the voke C' to move up and the yoke C" to move down, or vice versa, the effect being to transform the yoke into an ellipse of varying length, according to

change speed gear, has been developed to a point where the public has had opportunity to test its qualities. At the same time, a great amount of labor is being expended in working out the system, which is too important to be overlooked.

One of the most recent developments of this class is the invention of Professor Hele-Shaw, whose multiple-disc clutch is famous as the prototype of its class. It is built on the plunger principle, that is to say, both driving and driven elements are composed of batteries of four small cylinders, arranged radially about the common axis of the clutch and carrying plungers from one to the other series of which motion is transmitted by the working fluid. Variations in the driving ratio from one to zero up to one to one, are obtained by varying the length of stroke of the plungers in the driving member. Furthermore, as this variation may be made smoothly and through stages of any desired length, it follows that the speed control of the vehicle may be as even and gradual as is desired.

the position of the controller. When the yoke is in the position shown in the illustration, the path of the rollers is perfectly circular, and therefore, if the shaft on which the cylinders, A, are mounted is caused to revolve, the plungers will not move, but will be held stationary. In the other extreme positions of the yokes, the plungers will be given their full travel, and will make four strokes per revolution.

The plungers B', in the driven group, shown in Fig. 2, are similarly arranged, but the rollors mounted on their plungers are constrained to run upon a path in the driven drum, B, which is permanently elliptical. Connecting the first and second groups of cylinders are a series of passages formed in the hollow driving shaft through which the working fluid is passed back and forth. From the plungers A, it is sent through the port F'', direct to the driven cylinders, to which it is admitted through ports in a rotary valve made integral with the part B. It is afterward returned through the low pressure port F' to the driving cylinders

again, thus completing its circuit. Two chambers are provided in the surrounding casings, I, I', the first, leading from the high pressure side of the system through a safety valve, R, to the supply reservoir, J, while the second is in communication with the same source through the pipe, I"'.

In action, with the driving pistons constrained to remain at the heads of their respective cylinders, as shown in Fig. 1, the system will be completely filled with a solid column of liquid, which, being incompressible, constrains the parts comprising the two groups of pistons to rotate together. When power is applied at the point, F, this constitutes a "direct drive" up to the point where the secondary pistons make contact with the track in the drum, B. This path being elliptical, and the driven pistons being immovable, it follows that the drum, B, and so the secondary shaft of the transmission, will also be driven at the same rate of speed as the primary. By varying the position of the yokes, C'-C", the driving pistons are given a greater or less amount of travel, thus permitting the liquid to circulate and give a corresponding motion to the secondary pistons, thus retarding the speed of the driven shaft, up to the point of full stroke in the driving group, when the circulation of liquid is so rapid as to permit the secondary shaft to remain absolutely idle.

Another recent device, which is interesting in this connection as typifying the rotary type of clutch movement as distinguished from the reciprocating, is that shown in Figs. 3 and 4, which illustrate the design of William Watson, another British engineer. In this, the principle employed is that of the vane pump, the driving and drivtn elements again being quite independent of one another, though very compactly arranged.

Referring to Fig. 3, A, is the driving shaft, B, a sleeve surrounding it, and D, three sliding keys which work against as many projections, E. At F are three cam surfaces, which work against the blades, G, which, in turn, slide in channels formed in the driving element, and are held outward normally by springs. Fixed to the sliding keys, is a collar, K, (Fig. 4), which is grooved to receive a piece, M, actuated from the outside by the rod, N, when it is desired to alter the control of the device. Working the rod, moves the collar, K, and, by moving the sliding keys, D, by engaging the projections. E, rotates the sleeve. B, sufficiently to cause the cam fingers, F, to withdraw the blades, G, into the boss of the driving member. This causes the release of the clutch and renders the device idle

The driven element consists of the annular casing, O, which is provided with a couple of grooves carrying the blades, Q, held outwardly by springs. The two pressure ports, S, lead from the annular space, U, between the driving and driven elements, to the space oueside the drum, O, while T,

are the exhaust ports, leading around to the intake side of the driving element through ports in the ends of the casing. The outer casing, containing the last mentioned transfer ports, provides a series of smaller ports, 3, which serve to throttle the flow of liquid, and retard the circulation to any degree necessary.

Within the outer casing are placed three blocks, W, the inner surfaces of which are of the same radius as the driven element, O, and which are moveable radially through the mechanism, X, controlled by the shaft, 10, to vary the area of the annular space between the blocks and the driven element. It will be observed that the inner space, U, is divided into two sections by abutments, and the outer into

In all hydraulic clutches the gradation of speed is accomplished without interrupting the drive and without resorting to determinate "speeds." The control which this furnishes is so ideal in its nature that it is remarkable no more rapid progress is being made in developing the principle.

Block to Aid in Repair of Chains.

It is one of the simplest matters in the world to describe how readily a driving chain may be repaired at the roadside merely by cutting out a faulty link or two and replacing them by new ones which always are ready to hand in the tool kit. But drivers who have tried to follow directions in this respect have learned to their sorrow that owing to the great degree of hardness

kilometres or 1,300 miles in round numbers. with a two-day exhibition at Nice, and a one-day exhibition at Paris in conclusion. The daily schedules averaged from 200 to 326 kilometres per day (124 to 200 miles), and extended over eight days. The entrants were divided into five classifications, rated according to weight and cylinder bore, with a distinction according to the number of cylinders. Each class was further subdivided into two sections in which repairs to wheels or tires might or might not be effected during the trip, according to stipulation made in the entry blanks. A curious reflection on the unstable character of the resilient wheel propaganda appears in the fact that there were just twice as many entrants as starters.

Typical of the care with which the modern steering reaches and connections are worked out, is the method of adjustment found in the new set of connections which has just been brought out by the Long Arm System Co., Cleveland, O. Instead of employing a very fine thread on the plugs which hold the outer sockets in place, a relatively coarse thread is used, which, when tightly fitted, is much less subject to wear than is the case with a finer pitch. To facilitate adjustment, the plug is provided with three intersecting cotter pin slots across the outer end, while the shell of the bearing is drilled with two holes for the pin, placed at right angles to one another. By this means an adjustment of 1-12 turn, or 1-144 inch may be obtained, so that a proper working tension may be maintained at all times without difficulty.

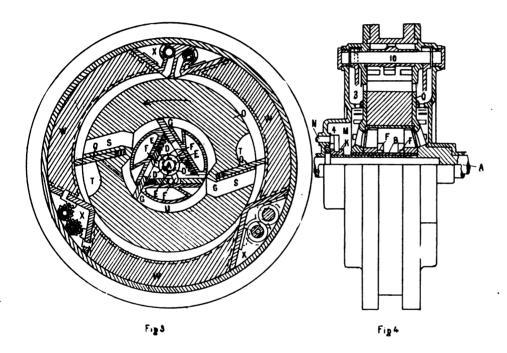

The design also provides for hardened sockets, japanned, and therefore rustless springs, and heavy wrought iron piping for the body of the reach. The parts are supplied in sizes suitable for 1, 11%, and 114 inch balls, and in lengths as required.

Almost everything in the way of an elastic wheel has been proposed before now, but the very latest idea in this line contemplates the perfectly novel use of a wheel made in one entire piece from "rubber, gutta-percha, or other elastic material," which is an innovation to which the Far East has lately given birth. The scheme has been made the subject of patent grants in the State of Perak, of the Federated Malay States, and is the invention of the manager of a local gutta-percha company.

Motor Cars for Factory Employes.

Motor vans for transporting factory hands between their homes and the shops where they are employed, constitute an unwontedly humanitarian innovation which is about to take place in the neighborhood of Moscow. Count Scheremetzew, who owns several sugar factories in that vicinity has just ordered three German motor vehicles which are to be used for this purpose.

three by the guides which locate the position of the sliding blocks, W.

As the driving element is turned in the direction of the arrow, the blades in the driving member force the liquid out through the pressure ports, S, into the outer space, the pressure thus formed reacting against the abutments in the outer casing and serving to drive the blades, Q, in the same direction. The part O, being coupled to the driven shaft of the transmission, the connection is thus established through the system.

In order to increase the speed of the driven member, the blocks W, are brought inward by means of the gearing, so that the area of the outer annular passage is reduced. This, in turn, increases the velocity of flow in the liquid, and so increases the speed of the driven part, O, up to the maximum speed, when the blocks are in contact with the driven member, O, and the outer passage has entirely vanished. At this point, the parts become locked together and the entire mechanism revolves as a single part.

of the parts this simple little task proves to be a most provoking one to undertake. This is particularly true of roller chains.

The introduction of the Diamond Repair Block, which has just been placed on the market by the Diamond Chain & Mfg. Co., Akron, O., however, promises to put an end to all difficulties of the sort. In order to remove a link, it is merely necessary to place the chain in the block, slip on the top piece, give the rivet heads a few light taps with a hammer and lift off the side plate. The repair link may then be inserted and the entire task completed in a wonderfully brief space of time, all things considered. If it is desired to use the old link again, all that is required is to head over the rivets once more.

Annual French Test of Elastic Wheels.

Twenty-one contestants figured in the annual spring and elastic wheel and tire competition, which commenced on Tuesday, 7th inst., in Paris, under the auspices of one of the sporting dailies. The trial consisted of a run to Nice and return, totalling 2,100

ROADSTER FOR THE SUBURBANITE

New Studebaker Model with Compromise

Body of Original Design—Its Neat

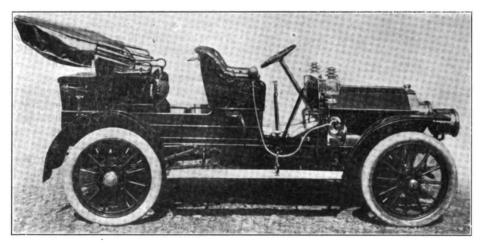

Feature of Adaptability.

As the average automobile owner is gaining in his appreciation of the motor car as a useful accessory to his daily life, the designer is gradually changing his plans with an eye to developing the widest possible utility in the product. This tendency is manifested in numerous instances among the new cars of this season, nowhere, perhaps, to better advantage than in the case of the new Studebaker Suburban Roadster. In common with a large number of ma-

or commercial van, which, though primarily intended only for tradesmen, is frequently required by the private owner for purely temporary uses.

Lubricating Gear Boxes and Axle Cases.

Owners are gradually learning to consult the maker, or agent, when purchasing a new car, in order to learn just how much oil is required in the crank case in order to secure proper lubrication, but they are slower in learning that it is almost, if not quite as important, that the proper quality and the proper amounts of lubricant be used in the gear box and live axle casing. Particularly in the case of the axle, it is important that lubrication should be plentiful and of the right sort, as the action of the differential involves great tendency to heating unless

STUDEBAKER SUBURBAN ROADSTER

chines of the runabout class, this machine has interchangeable rear seats, accommodating either one or two passengers, as the case may be, and readily demountable. Unlike the average, however, the removal of the seats leaves, not a flat or sloping deck, but a box body, suitable for carrying luggage or other light loads, and correspondingly convenient.

The accompanying picture gives a good idea of the appearance of the car, the equipment shown including the two-passenger rear seat, luggage rack behind, and cape top which may be raised to cover the entire vehicle. The body itself, follows the principle of the conventionalized Beverly wagon, which has been so popular among users of horse-drawn vehicles, and which comprises a moderately high box back of the front seat, set off in straight line panels. When the rear seat is removed, the tray or box is left open and perfectly free for haulage purposes.

The chassis is the regular model employed on all Studebaker cars this year, equipped with a 30 horsepower motor and sliding gear, shaft drive, transmission. The body may be used interchangeably with others, if required, and is intended to fill in the gap between the full blown touring car, which is fitted to replace, and the luggage

proper measures are taken to prevent it. When there is any doubt as to the proper quantity of oil to use, it is well to put in sufficient to work out under the brake drums at the end of the axle, afterward drawing it off a little at a time until this indication of a surplus is no longer apparent.

When cleaning out gear boxes and live axle casings, the quickest method of removing the oil and grease is to pour in a liberal quantity of kerosene oil, after draining off all lubricant that will flow, and then to jack up the rear end of the car and run the motor for a few moments, changing gear from time to time, so as to bring all the gears into play. After draining off the thickened solution which is thus formed, replace the drain plugs and pour in more kerosene, when the remnants of hardened grease may be loosened with an old paint brush, with which all the corners should be searched out. After draining a third time, new lubricant may be put in with good assurance that it will not be fouled with old oil or dirt. Such a cleaning requires only a comparatively small amount of time and labor, and should be resorted to at least two or three times a season. The fact that the gears will "run" by no means proves they do not require attention.

VARIED USES OF THE MANOMETER

Not Restricted to Its Ordinary Purpose— Conditions that may be Determined by Its Readings.

Though a considerable number of cars are equipped with manometers, or gauges indicating the pressure in the cooling system, it is safe to assume that only a comparatively limited number of users understand their full purpose, or know they are useful in a number of ways outside the very apparent one of indicating whether the pump is working or not. That their use may be extended considerably by gaining a thorough acquaintance with its working, must be apparent, however, on a moment's thought.

Primarily a pressure gauge, and as such, showing only, how much pressure exists in the piping of the cooling system, it is evident that fluctuations in its reading may be caused by one of four conditions. That is to say, the reading will vary as the engine speed, and so the speed of the pump varies; as the pressure in the system rises in response to stoppage of the flow at some point, the generation of steam in excessive amounts, or the breakage of a connection permitting sudden leakage; or as the speed of the pump falls off in the event of a fault in the driving connection.

Ordinarily, the indication of the needle furnishes an exact record of the speed of the crank shaft, and were the dial so graduated, would serve the purpose of a speed indicator perfectly well. Were the drive always in the same ratio, it would also serve as a speed indicator for the vehicle itself and record equally as well its rate of travel. The use of the change speed gear prevents this, ordinarily, but by the same token, the manometer serves a useful purpose in revealing the need of changing gears when road conditions become altered in any way. Thus, the motor invariably does its most effective work within a rather narrow speed range. If this is known, any dropping below that speed, may be taken as an indication that the motor is overloaded, and that, if suitable manipulation of spark and throttle levers fail to bring up the speed of the crank shaft, a lower gear should be resorted to in order to secure the smoothest possible running. In the same way, any undue "racing" of the engine, may be taken to indicate that a higher gear may be employed to advantage.

The experienced driver commonly relies on the sound of the exhaust or the beat of the valve gear to judge his handling of the motor, but with the silent operation of the modern car, it is not always possible to tell accurately just how easily the motor is pulling its load. Especially when driving through traffic the response of the cir to clutch and motor control levers must be

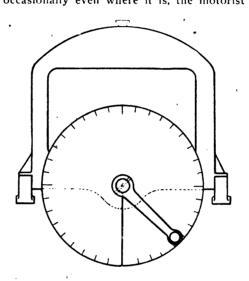

METHOD FOR TIMING THE VALVES

How the Motorist can Make the Necessary

Device—The Way in Which It Can

be Employed.

Valve timing seldom falls to the lot of the everyday motorist. When it does, however, it is apt to prove more than puzzling unless certain systematic methods are followed. Most of the modern and up to date cars are furnished with guide marks on the motor fly wheel which are labelled to indicate the proper opening and closing points of the valves, as well as the proper sparking point for the igniters. Where this convenience is not provided, and, indeed, occasionally even where it is, the motorist

may be considerably aided by the use of a simple device in the shape of a graduated disc, which may be slipped over the starting crank and used for determining the angular position of the crank shaft at any time.

The device in question may be either a sheet of stiff cardboard, cut circular and with a hole in the center and a slit cut radially in it so that it may be put into place without removing the starting crank, or, where greater permanence is desired, it may consist of a sheet of good firm paper, carefully laid out in circumference and degrees. and afterward mounted on a sheet of tin and shellaced or varnished, to preserve it. In either case, it is put in place and held firmly against the radiator with the zero point carefully adjusted so that one edge of the starting crank exactly coincides with the proper line, when the piston of the first cylinder to fire is on its upper dead center.

Once this adjustment has been made, the timing may be adjusted exactly according to the requirements of the motor in degrees—if that happens to be known, or the distribution of the various cylinders may be compared with absolute accuracy. If the setting of the valves is known in terms of piston travel, rather than degrees of crank motion, for example, it is merely

necessary to set the valves on one cylinder in this way. The others may be set to open and close in exactly the same time. by observing the degrees of crank motion. as recorded by the movement of the stars ing crank over the graduated scale, and josting them down for reference, as the first cylinder is timed. Afterward, the same setting may be obtained for the other cylinders by using the scale as a guide, the only special requirement being that of turning the scale about in such a way that the starting crank always crosses the zero line just as the piston reaches the top of its stroke. The same effect may be secured by making proper allowance for the difference in degrees between the various cranks, adding the requisite number of degrees to the setting first employed. as the different cylinders are treated.

Another use of this device, which is emphasized by the Autocar, from which the accompanying illustration is taken, is that of adjusting the clearance of the valve lifters to absolute uniformity. The degree of clearance between the lifter and the end of the valve stem, obviously governs within narrow limits, the timing of the valve itself. That is to say, diminishing the clearance also causes the valve to open a trifle earlier than otherwise would be the case. On this account it is important that the clearance should be uniform for all the cylinders of a multi-cylinder motor. This, it would be, were the valve stems all of the same length, and the cams absolutely uniform. But in the case of old motors, where the cams may be unequally worn, the simple expedient of measuring the clearance by inserting several thicknesses of paper between lifter and stem, will not suffice.

With the arrangement indicated, it is possible to test the clearance with absolute accuracy by inserting a very thin piece of paper between the lifter and stem and turning the crank slowly, observing the points at which the paper is gripped and released again by the two parts. Obviously, the number of degrees during which the paper is held firmly, should be the same for all exhaust valves, and the same for all inlet valves. Variations may be eliminated by adjusting the tappet-screws, where such are provided, or by lengthening or shortening the length of the valve stems.

Demountable Live Axle in Special Form.

To obviate the drawback peculiar to certain forms of live axle whereby it is necessary to dismount the part from the chassis in order to dissect it, a French designer has devised a special form of demountable axle so constructed that the gears may be withdrawn without even removing the wheels. To effect this the differential gear is mounted on a short, removable counter shaft, which drives the axle stubs through spur gearing. The adoption of helicoidal teeth on these gears also permits the axle to be cambred without necessitating the use of universal joints or couplings.

taken almost alone to show whether conditions are as favorable to the production of power as is possible. The manometer shows at once how fast the motor is running at all times, and so long as the driver carries a fairly good idea of what pressure reading should correspond to a given car speed, he can also tell whether the power is as great as it should be.

One Frequent Cause of Short Circuits.

Frequently batteries "run down" in a very short time. As frequently the battery is condemned, because the current was so quickly exhausted, when in fact the battery is not at all at fault, the cause lying in a short circuit somewhere in the wiring.

A common cause of short circuiting which yet is generally unsuspected, will be found in stray strands, of which most wires are built up, coming in contact with metal parts which should not be touched by the wire. Very often when placing the wire under a nut or around a stud, that is insulated from the rest of the metal, one or two of these minute strands will not be secured and shortly will vibrate or be jarred against the machine in such form as to permit of a continuous flow of the current. Obviously this contact will serve as an outlet for the current with the result that the batteries will soon become useless. If care is taken to properly secure the wire this batterycomplaint will be infrequent.

A quick way of testing a short circuit in the primary connections of the ordinary jump spark ignition system, is to apply a coltmeter across the terminals of the entire battery while the commutator is standing at one of its neutral points. After observing the reading of the instrument, throw the cut-out switch back and forth several times. If the circuit is perfectly insulated, there will be no difference in the reading under these circumstances. If there is a short-circuit or a ground, however, the needle will fluctuate, as the open circuit reading is always higher than that when the circuit is closed.

Replacing Core in Spark Plug.

As nearly all manufacturers of porcelain spark plugs furnish extra porcelains for their product, it seldom is necessary to buy a new plug simply because the core of the old one has become useless. There is, however, a right and a wrong way of introducing the new porcelain into the old base.

When removing the bushing that holds the core in place, the simplest method is to hold the base or shell of the plug in a vise, then a wrench should be adjusted to fit perfectly the hexagon sides of the bushing. If this is done no damage will be inflicted on the bushing, but if the wrench does not fit and is permitted to "climb" the bushing, i. e., to hold only at the corners of it, the bushing is apt to be strained to such an extent that it will not fit evenly on the gasket with the consequent results of a compression leak.

IN CLUBS AND ASSOCIATIONS

Big Club House Planned for Kansas City— New Organizations in Troy and Fort Smith—Annual Elections,

It was definitely decided by members of the Automobile Club of Kansas City at its last meeting to purchase a tract of land south of Kansas City and to build a club house. It is planned to have the club house at least 15 miles from the city and to get a plot large enough to include a garage, storage sheds and a field for outdoor sports. While no action was taken pending a decision as to the site, the members expressed themselves willing to expend \$10,-000 or more if necessary. A committee consisting of Dr. E. M. Hetherington, Amos Martin, Henry Fowler, A. J. Davies and Fred Heim was appointed to select a site and arrange building details.

Colonel Frank M. Joyce was unanimously re-elected president of the Minnesota State Automobile Association at its annual meeting held in St. Paul last week. Reuben Warner was made vice-president, and Dr. W. H. Card was again elected secretary and treasurer. The board of directors is made up as follows: Duluth, H. H. Myers; Faribault, W. A. Bill; Mankato, G. A. Lewis; Minneapolis, George H. Daggett, Dr. A. A. Law, Thomas H. Kennedy, Dr. C. H. Kohler, Frank M. Joyce, and Dr. W. H. Card; Owotonna, E. T. Winship; Red Wing, C. E. Bechter; Rochester, Dr. E. O. Judd; St. Cloud, J. C. Cotton; St. Paul, Reuben Warner and F. B. Lynch; Winona, E. W. Will-

Robert Beattie, of Little Falls, was elected president of the North Jersey Automobile Club, which has its headquarters in Paterson, at the annual meeting last week. Other officers were chosen as follows: First vice-president, Dr. J. H. Faulkner; second vice-president, Benjamin Eastwood; secretary-treasurer. James Madden, Jr.; captain, George E. Layton; first lieutenant, W. B. Proude; counsel, Jacob Vanderclock.

At its annual meeting held in Daytonna, the Florida East Coast Automobile Association elected the following officers: President, A. B. Foster; first vice-president; S. H. Gove; second vice-president, J. H. Allen; secretary, T. E. Fitzgerald; treasurer, F. N. Conrad; directors, Edward White, Henry B. Welch, R. M. Bond, E. F. Oates, J. B. Moore, and A. Hilliard.

George II. Wilson having positively resulted to serve a fifth year as president of the Louisville (Ky.) Automobile Club, Pike Campbell was chosen as his successor. The other officers are: First vice-president, John Ross; second vice-president, J. B. Lewman; secretary, Eugene Straus; treasurer, Walter Kohn.

The Troy (N. Y.) Automobile Club has

been organized with the following officers: President, F. B. Twining; vice-president, E. S. Platt; secretary-treasurer, Alonzo McConihe; governors, G. A. Cluett; LeGrand C. Cramer, H. S. Ide, John McGlynn, Joseph J. Murphy, R. C. Reynolds, John Squires and Dr. L. R. Whitney.

Fort Smith, Ark., now has an automobile club—the Fort Smith A. C.—with the following officers and directors: President, John Vaile; secretary-treasurer, Fred Reutzel; directors, George Lyman, Clifford Speer and Frank Handlin.

Another Joy Rider with Fake Checks.

The Zumstein company of Cincinnati, to say nothing of more than a score of other firms and individuals, would like to know the whereabouts of an individual claiming to be a well known business man of Springfield, Ohio, who left a trail of worthless checks from Cincinnati to Lexington, Ky. The man started out for a large time, after hiring a car from the Zumstein company and filling it with rapid acquaintances. Before the first round of pleasure was over a large plate glass window had been broken. It cost the man just \$90, which he paid by check, which was sent back with the discouraging stamp, "no funds." Along the booze trail to Lexington any one who wished might have a drink on the "Springfield" man. He would never permit another to buy, and at every stop stood treat for the house. Checks always satisfied the barkeeps. The return journey was even more merry, and when the Zumstein company presented their bill for \$200, the Springfield good fellow paid it without a murmur, by check. Then he left town and since that time the wires between Cincinnati, and Lexington and Springfield have been sizzling.

Bill for Transcontinental Boulevard.

By request of somebody, whose identity he has not disclosed, Representative Bourke Cochran of New York, introduced in Congress on the 14th inst., a bill which old timers pronounce the most remarkable legislative contrivance that ever found its way into the curiosity catacombs of the House. Its aim is to transform the 35th parallel of north latitude into a macadamized highway, to be constructed by the United States Government. It is to extend from the Atlantic Ocean to the Golden Gate, via Newbern, N. C., and to be electric lighted, policed and bordered with new idea garden cities wherein neither man, woman, nor child shall break the speed limit of eight miles an hour, on foot, roller skates, bicycles or automobiles.

There is a man in Yarmouth, N. S., who would like to trade a 15-year-old orchard, containing about 1,000 trees, two summer cottages, the whole valued at \$5,000, for a good automobile. He noticed the advertisement of a Pittsfield (Mass.) dealer who had a car for sale, and made the proposition to him.

MANY GARAGES LOOTED BY A LAD

Juvenile Prisoner at Los Angeles Accused of Long Series of Robberies—His Big Store of Spoils.

By the arrest of Earl' Stein, 16 years old, the police of Los Angeles think they have captured one of the cleverest crooks in the city, one whose garage robberies have baffled the city's detectives for more than a year.

When a detective searched the boy's room it was found to contain thousands of dollars' worth of automobile parts, tools, all kinds of tobacco, and other things.

Several days prior to the arrest of young Stein, the Auto Exhibit Co. reported the loss of valuable machinery, and a piece of brass worth \$90. A young man employed at the place was suspected. A detective, in a talk with him, learned that two boys had been in the garage a short time before the robbery was discovered.

Suspicion rested upon young Earl Stein. His mother refused to permit a detective to enter the house, and the latter procured a search warrant. In the boy's room, he says, were found hundreds of parts of automobiles. Two heavy, brass bound oaken chests contained hundreds of fine tools, and more parts of motors. There were also two motorcycles, dismantled so that identification would be impossible; automobile tires, a handsome shot gun, a trunk filled with Egyptian and Turkish cigarettes, expensive cigars, cigaret papers, boxes of tobacco and 20 pounds of chewing tobacco.

Earl is now at the Detention Home, awaiting trial. With him was arrested Augustus Gibbs, 15 years old, who was charged with having stolen a bicycle from Detective James Campbell, of the District Attorney's office. Stein is said to have been implicated, as it is alleged that the bicycle was dismantled and parts of it hidden in a sand pile, while the rest was taken to his room.

The garage robberies in Los Angeles have baffled the police for more than a year. It appeared that the thefts were committed by experts, because in every instance small but valuable parts of motors were taken. The machinists employed at the various garages were closely watched but no proof that any of them was guilty was obtainable. By the arrest of Stein the police hope to solve the mystery.

Automobiles Form a Funeral Cortege.

Butte, Mont., had its first automobile funeral recently when 18 cars, draped in sombre black, and carrying friends and mourners, followed the hearse which carried the remains of Joseph C. Kennedy to the cometery. The dead man was a prominent member of the Butte Automobile Club, and sold cars in that city.

The Week's Patents.

879.509. Flexible Tire Frame. Eugene D. C. Bayne and Lawrence A. Subers, Cleveland, Ohio. Filed Feb. 19, 1907. Serial No. 368,181.

1. A tire frame comprising an annular flexible tube having overlapping extremities, a rotatable support therefor, and means for aligning said frame upon said support, comprising keys inserted in the inner edge of the frame and bearing against the edge of said support, substantially as described.

879,511. Tire and Luggage Carrier for Automobiles, etc. Joseph J. Bond, Reading. Mass. Filed March 20. 1907. Serial No. 363,466.

1. A carrier comprising a receptacle

formed to enter an automobile tire, and provided with means for attachment to a support, said receptacle being surrounded by a tire receiving space, and the said carrier having means for securing a tire in said space.

879,646. Foot Rest for Vehicles. Louis A. Jones, Cambridge, Mass. Filed Feb. 20, 1907. Serial No. 368,512.

1. An apparatus of the character described comprising in its construction a body, a movable foot rest located at all times within said body, a door pivoted to swing about a vertical axis, and mechanism operatively connecting said foot rest to said door.

879,757. Piston Ring. Henry Ford. Detroit, Mich. Filed July 16, 1906. Serial No. 326,481.

1. A packing ring comprising an inner ring having oblique overlapping ends and a pair of outer facing rings seated side by side on the inner ring each having their ends halved and gained together, said ends being staggered in relation to each other and to the inner ring ends.

880,024. Explosive Engine. John D. Hay, Chicago, Ill., assignor of one-half to William R. Donaldson and one-fourth to George W. Marble, Chicago, Ill. Filed Oct. 13, 1906. Serial No. 338,752.

1. In a device of the class described the combination with a crank case and cylinder secured thereto having an inlet port of a passage cored in the wall of the cylinder opening directly into the crank case at one end and opening through the side of the cylinder, an exhaust port opening from the cylinder above said passage, a piston in

AMERICAN DISTRIBUTING CO.,
American Trust Building, CLEVELAND, OHIO

BRUSH \$500 RUNABOUT

We are getting ready for the rush. Having been sold up every minute since the first week of January we know what fair weather is bringing and have prepared for it with more machinery, increased orders for stock and more room.

Still if you want to handle Brush Runabouts this year, take it up at once. Best way is to come to our factory, if possible. Don't delay, we will soon be sold up for the year.

BRUSH RUNABOUT CO., Detroit

Digitized by GOOGIC

said cylinder having a chamber in the head thereof, passages leading downwardly therefrom through the wall of the piston and opening outwardly, one of said passages adapted to register with the end of the passage in the cylinder wall and a passage adapted to communicate with the other passage in the piston at the lowest limit of movement of the piston and also communicating with the inlet port for the cylinder.

880,025. Running Gear or Suspension Frame for Vehicles. Reinhold Herman, Crafton, Pa. Filed Dec. 15, 1905. Serial No. 291.876.

1. A vehicle frame comprising the combination with a pair of axles, and springs mounted thereon, bolsters mounted on the springs, and a pair of superposed frames, one of which is journaled at one end in one of the bolsters, and the other of which is journaled at the opposite end in the other of said bolsters.

880,050. Reversing Gear for Internal Combustion Engines. Jakob Sulzer, Winterthur, Switzerland. Filed Dec. 5, 1905. Serial No. 290,369.

1. In a reversal gear for internal combustion engines the combination with a fuel admission gear of a roller carried by said fuel admission gear, an actuating cam and means for moving the roller into a middle position beyond the range of the actuating cam and into either of two extreme positions within the range of the cam and corresponding respectively with the two directions of running of the engine, substantially as described and for the purpose set forth.

880,051. Reversing Valve Mechanism for Internal Combustion Motors. Jakob Sulzer, Winterthur, Switzerland. Filed Dec. 8, 1905. Serial No. 290,915.

1. An internal combustion or explosion motor having a reversing valve and a fuel-supply valve, in combination with oscillating cam plates for actuating said valves, and means for shifting the oscillating cam plates to an intermediate position in which they do not move the said valves, and into two extreme positions, corresponding to the two directions of movement of the motor, in which they do move the said valves, substantially as described.

880,076. Running Gear for Motor Driven Vehicles. Rex P. Hicks, Minneapolis, Minn. Filed Nov. 21, 1906. Serial No. 344,-451.

1. In a running gear of the kind described, the combination with a main frame and a supplemental frame, of rear wheels journaled to said supplemental frame, a driving wheel journaled to said supplemental frame between and forward of said rear wheels, resilient main frame supporting connections applied to said supplemental frame longitudinally intermediate of the axes of said driving wheel and of said rear wheels, and connections between said main and supplemental frames for causing the same to travel together, substantially as described.

880,083. Friction Clutch. Ernst Lehmann, Marchienne-au-Pont, Belgium. Filed Nov. 27, 1906. Serial No. 345,370.

1. In a friction clutch in combination a casing, the said casing serving as a driving member and being provided with teeth on its outer edge, friction members co-operating with the inner face of the said casing, a driven shaft, a sleeve adapted to slide on said shaft and acting on the friction member to bring them in frictional engagement with the driving member, bolts or catches pivoted on the said friction members and

adapted to be engaged with the teeth on the driving member, a second sleeve actuating the said bolts or catches, and means whereby the said second sleeve is acted upon on the stopping of the clutch substantially as described and for the purpose set forth.

880,084. Friction Driving Clutch. Axel D. Le Moon, Chicago, Ill. Filed April 11, 1907. Serial No. 367,646.

1. The combination of a driving member and a driven member separately journaled to rotate about the same axis, a friction shoe loosely mounted between said members and having thereon two cam surfaces located in different angular positions with respect to the axis of said members, one of said members having thereon a pair of projections angularly spaced with respect to said axis to correspond with the angular spacing of said cam surfaces, said cam surfaces and projections being adapted to urge said shoe toward said driven member through the relative rotation of said shoe and driving member.

880,093. Speed Limiting Device for Electrically Ignited Explosive Engines. Frederic S. Perrin, New York, N. Y. Filed Jan. 9, 1907. Serial No. 351,489.

1. In an electrically ignited explosive engine, a primary circuit, means for shunting the primary current from its circuit, consisting of a speed indicator; a movable index, a contact point adapted to be set at any point upon the indicator scale, in the path of the index; and an electric circuit, in multiple with the primary circuit, including the contact point and the index.

880,110. Acetylene Gas Generator. Leon Sussman, Bayonne, N. J., assignor to The Manhattan Screw and Stamping Works, New York, N. Y., a Firm. Filed April 28, 1906. Serial No. 314,114.

1. In an acetylene gas generator, a carbid chamber and a water chamber, a valve which in one position establishes communication between the two chambers and which in another position throws the carbid chamber into communication with the outer air, and another valve located in the connection between the water chamber and the first-named valve and provided with a stem which entends outside of said chamber for regulating the flow of water to the carbid chamber.

880,117. Compensating Mechanism for Automobiles. Charles H. Ball and John F. Rogers, Cleveland, Ohio. Filed April 6, 1906. Serial No. 310,297.

1. A compensating mechanism for vehicles, comprising a driven axle, a wheel mounted to turn independently on the axle, and mechanism to positively engage the wheel with the axle comprising segments and a cam and wedges to force the segments into locking engagement with the wheel.

880,184. Lamp and Lantern. Charles Bergener, Rochester, N. Y., assignor to C. T. Ham Manufacturing Company, Rochester, N. Y. Filed Sept. 30, 1907. Serial No. 395,108.

1. The combination with a lamp or lantern body and a movable part adapted to be fastened thereto, of a spring catch pivoted to said body and a lug on said movable part which is engaged by said catch, the latter being constructed of elastic wire and comprising bows on opposite sides of said lug, pintles at adjacent ends of said bows, locking portions at the opposite ends of said bows engaging the outer face of said lug, and an end loop forming a raised finger piece, substantially as set forth.

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order. In capitals, 25 cents per line.

STODDARD-DAYTON—We have stored in Paris a 1907 touring car in fine condition, full equipment for touring. Will sell or trade for a Stoddard-Dayton in the United States. THE DAYTON MOTOR CAR CO., Dayton, O.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

APPERSON'S

Wonderfully Consistent Showing

At the Briarcliff Race, New York, April 24th, the Apperson "Jackrabbit" won the Fourth place, defeating nine foreign and nine American cars.

The winners of First and Third places each had three cars competing; the Apperson defeated two out of three of each. The winner of Second place had two cars competing and the Apperson defeated one of them.

The Apperson was the only single entry of any one make of car to finish before the race was stopped.

The Apperson defeated one or more cars of every other make that competed.

OTHER VICTORIES

February 29th:—The Apperson won the Altadena-Pasadena Hill Climb in California, breaking the record and defeating twenty-eight cars.

February 21st:—The Apperson broke and now holds the road record between Los Angeles and Bernardino, California.

March 18th:—The Apperson won the 180-mile race for Stock Cars at Savannah, Georgia.

March 19th:—The Apperson won second place in the 360-mile race for Stock Cars at Savannah, Georgia.

April 19th:—The Apperson, in a field of over 80 entries, made faster time in the Fort George Hill Climb, New York, than any other foreign or American gasoline car.

There is a reason for this wonderfully consistent showing. It lies in Apperson Experience and Apperson Quality.

We have a remarkably attractive line for the <u>Season of 1909</u>, and invite immediate correspondence with reliable dealers.

One Price for Warner Auto-Meters

EVER, until this year of 1908, has there been a speed indicator sold at one absolutely fixed list price. Manufacturers have "named" a list price and some even required the dealers to sell at "that" price.

Only one "insisted" upon it being observed. That was ourselves. But, unfortunately, we sold to the jobber also — and the jobber cut the price.

Then there was fun in the camp. That hurt us—it hurt the dealer, too.

Then, in his haste to close a sale, the jobber would let wrong gear ratios go out—that

hurt the consumer, the dealer and ourselves. For the jobber knows no law.

So we've cut the jobber's quotations out. If he gets Warner Auto-Meters he pays for them the exact figure the dealer pays. If he cuts, he gets no more Auto-Meters.

THIS STAND IS POSITIVE.

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

A TOURING CAR IN THE TRUE SENSE OF THE TERM

The man who gets the most pleasure from his touring car is not the man who limits his touring to the macadam roads; for the most interesting sections of the country and those of the greatest natural beauty lie, for the most part, beyond the regions of improved highways. For that reason, there is no quality of a motor car more important than the ability to traverse had roads.

In unique degree, the White possesses the qualities of a "bad roads" car. Owing to the perfect flexibility of the engine, the White tourist can accommodate the speed of his car, yard by yard, to the condition of the road, speeding up on each little stretch of good road, and slowing down for each hole and "thank-ye-ma'am"—without shifting of gears or any manipulation except of the throttle. The tremendous pulling power of the White engine under all conditions means immunity from getting stuck in the mud or sand. Running through deep water, as in fording streams, is easy for a White. And as for climbing grades in mountainous regions—there is no other machine which can approach the White in hill-climbing qualities.

Drive a White Steamer and see the country

PRINCS

With All the Life of Metal Retained and Built with the Knowledge of Long Experience

Our experience in successfully meeting extraordinary requirements has taught us that the dynamic stress or combination of shock, push and twist to which automobile springs are subjected, can only be resisted by the use of a material of high dynamic qualities, made up by a process that will preserve all the initial life of the metal and constructed on mechanically perfect principles.

In our Special Vanadium Spring Steel, we have the right material: In our thermo static furnaces, the right method of retaining the "life" of the metal, and from our wide experience, the correct mechanical principle for successfully resisting these conditions and making "anti-fatigue" springs that are as nearly perfect as can be.

Our new booklet on springs explains these points in detail. Let us send it to you to-day.

A. M. C. M. A. SELECTS SHOW DATES

Exhibition in Grand Central Palace Will Open Dec. 31—Circumstances than Influenced the Selection.

Having decided to assume the whole burden of promoting and conducting the next show in Grand Central Palace, New York, the Automobile Club of America having condescendingly unshouldered its part of the load, the American Motor Car Manufacturers Association has lost no time in setting the dates for the function.

General Manager Reeves announced early this week that the show committee, of which H. O. Smith, of the Premier Motor Car Co., is chairman, had selected the dates Thursday, Dec. 31, 1908, to Thursday, Jan. 7, 1909. These dates will precede the period of the Licensed Manufacturers' show in Madison Square Garden; as although the A. L. A. M. has not made a definite decision, it is pretty well known that the Garden show will occupy either the second or the third week in January.

The A. M. C. M. A. committee considered the desirability of including in the program a seeing-the-old-year-out celebration on Dec. 31st, but probably recalling the sad results of the importers to work up a hurrah of the sort last year, they wisely abandoned the idea. No effort will be made to attract the horn-tooting, confetti-throwing mob that fills the street on the last night of each year, and that inclines to "rough-house" methods generally.

The show committee thinks that the show dates are very good ones from the selling point of view, on account of the many dividend payments at that time of the year. It estimates that about 150 great railroad and industrial corporations pay out from this city almost \$200,000.000 in dividends on stocks alone, in addition to the millions of dollars that are disbursed as payments on bonds, mortgages and other securities, and that the recipients are then in a mood to

spend money for automobiles, among other things.

. Martini Headed Toward Bankruptcy.

The Martini Import Co., New York, has gone the way followed during recent weeks by several other importing houses, a petition in bankruptcy having been filed against it by these creditors: Frank Presbrey Co., \$505 for advertising; Ernest Edwards, \$371, advertising, and Pneu L'Electric Co., \$226, merchandise. It was alleged that the company is insolvent and on March 27 transferred all its assets to F. F. Palmer, a creditor. The company is a New York corporation, incorporated March 1, 1907, with a capital stock of \$50,000, and continued a business previously conducted by a firm which had dissolved.

Acme Makes Another Payment.

The receiver of the Acme Motor Car Co., Reading, Pa., has declared another dividend of 20 per cent., making a total of 85 per cent. that has been paid to the creditors. The receiver still has on hand \$5,824, which is held pending final settlement of the claim of Col. Peter H. Corr, for \$5,000, which the referee has disallowed.

Col. Corr alleged that the amount was an obligation of the company, but the referee decided that it represented a note given by Frank A. Devlin, as president of the Acme company, to replace a personal note given long before, and that it was done without the consent or ratification of the company.

Ampere Again Short Circuited.

A petition in bankruptcy has been filed against the Ampere Mfg. Co., New York, makers of electric appliances, by these creditors: Leopold Pollock, \$911; John S. Lamson & Brother, \$37, and Joseph J. Fitzhenry, \$9. It was alleged that the company is insolvent and has transferred property to some creditors to prefer them. On January 30 Marcel Levy was appointed receiver of the company in the Supreme Court in dissolution proceedings. The liabilities were \$1,727 and the assets \$1,283.

TO REDUCE SELDEN ROYALTIES

Pressure from Within A. L. A. M. Finally Forces Action—New Basis Agreed on and Court's Approval Sought.

One of the important results of M. J. Budlong's tenure of office as general manager of the Association of Licensed Automobile Manufacturers became public property when on Saturday last the receivers of the Electric Vehicle Co. took the first step toward reducing the royalty exacted of the members of the Association under the terms of their membership agreement recognizing the Selden patent. If the court approves the receivers' application, the Electric Vehicle Co. will obtain annually not more than \$150,000 as its share of the royalty, and the Association not more than \$100,000, and in the event of a decision unfavorable to the patent being rendered, the royalties will be trusteed pending the result of an appeal.

It has been an open secret that for nearly a year certain members of the A. L. A. M. have been bringing strong pressure to bear to attain this end and when, early last fall. Budlong was made general manager, a strong card was obtained. As former president of the Electric Vehicle Co., he naturally was conversant with the other side of the situation and thus was unusually well placed. The whole matter was left with the executive committee of the A. L. A. M., and with Budlong they worked to good purpose, although the appointment of receivers for the Electric Vehicle Co. did nothing to simplify their task.

The action of the receivers on Saturday last represents the influence of their labors. On that day the receivers, H. M. Barrett and H. W. Nuckols, applied to the United States Circuit Court for the New Jersey District, for permission to modify the existing agreement between the company and its licensees under the Selden patent. The petition recites that under the existing

agreement the licensees are obligated to pay 11/4 per cent. of the catalog price of all vehicles they produce, except such as may be exported, on which the royalty is 1/2 per cent. Payments are required to be made quarterly, a discount of 20 per cent, being allowed for payments within 15 days, thus making the net royalty 1 per cent. The receivers acknowledge what has been known to the limited few-that a "large majority" (all save two, it is understood) have refused to pay the sums due for the past two quarters, on the ground that the royalty is "excessive and oppressive." Accordingly, the receivers believe it to the interests of the creditors and stockholders of the Electric Vehicle Co. to modify the agreement.

This proposed agreement, if made, will reduce the royalties required to be paid by the members of the Association by 20 per cent., with the further limitation that the maximum royalties to be paid in any one year shall not exceed \$250,000. It also provides that should a decree be entered adjudging the Selden patent invalid, the royalties shall, pending an appeal from that decision, be paid to the trustee to await the outcome of the appeal. It also contains certain modifications of the terms upon which new members to the Association may be admitted, and surrenders to the Association control of litigation to compel payment of royalties in excess of the maximum annual amount of \$250,000 above referred to. The "terms for new members" are understood to be a matter of phraseology.

The court has set Monday, May 4th, as the date for hearing on the petition.

If the Court lends approval, as is probable, it will mean that henceforth the total revenue in royalties from the Selden patent will not exceed the sum of \$250,000 annually. The 20 per cent reduction in the royalty will bring the proportion from 11/4 to1 per cent., which, less the 20 per cent offered for cash 15 days, will make the net royalty eight-tenths of 1 per cent. There will be no change in the basis of division between the Electric Vehicle Co. and the A. L. A. M. As at present, the former will retain threefifths and pay to the association the remaining two-fifths. On this basis, if the maximum amount,\$250,000, is reached, the Electric Vehicle interests will receive \$150,000 and the A. L. A. M. \$100,000.

Rambler Branch Books Big Order.

One of the largest single orders ever placed with a Chicago automobile house was secured by the local branch of Thomas B. Jeffery & Co., on Thursday, April 23. when six large seven-passenger Rambler cars were purchased by the Big Horn Basin Development Co. for use at Cody, Wyo. The Chicago promoters of the company were desirous of securing six automobiles that were thoroughly reliable and dependable, for the purpose of transporting passengers from Cody, the railroad station to the land they have for sale. Hence the purchase of Ramblers,

The Week's Incorporations.

Cleveland, Ohio.—Whitcomb Auto Livery Co., The, under Ohio laws, with \$25,000 capital. Corporators—Mac E. Meisel et al.

Hammond, Ind.—Hammond Garage Co., under Indiana laws, with \$5,000 capital. Corporators—J. W. McMullen, E. C. Houk, Thos. Larene.

Syracuse, N. Y.—Kolbe Auto Co., The, under New York laws, with \$4,000 capital. Corporators—Richard E. Kolbe, John D. Buckmaster, and Florence L. Buckmaster.

Camden, N. J.—Penn Auto Supply Co., under New Jersey laws, with \$20,000 capital; to deal in automobiles, etc. Corporators—F. W. Mills, H. M. Browne, and H. P. Jones.

New York City, N. Y.—Regal Motor Car Co. of New York, under New York laws, with \$50,000 capital. Corporators—Henry Amerman, 111 Broadway; Francis P. Rawle, 6 Wall street; James C. Austin, 156 Broadway, New York City, N. Y.

St. Louis, Mo.—Seeing St. Louis Automobile Co., under Missouri laws, with \$2,000 capital; to operate automobiles for hire, to deal in automobiles and automobile sundries. Corporators—G. Delaplaine, T. G. Boehm, J. W. Hapel, B. W. Frauenthal, E. Buchanan.

How Railway Discrimination Hurts.

"Discrimination in freight rates by the railroads is one of the predominating drawbacks of the automobile industry,' Frank Briscoe, makers of the little \$500 Brush runabout which has become so popular in the west. "Especially is the matter of freight rates discouraging to the maker of small cars and motor buggies. There is no sane reason why the automobile should not be shipped as cheaply as carriages. The small cars could easily be 'knocked down,' the body and running gear shipped as a carriage and the motor billed as an engine just as marine engines are shipped; thus saving the buyer a snug little sum on transportation rates. The Freight and Transportation Committee of the American Motor Car Manufacturers' Association have this matter in hand and should be supported by all manufacturers of cars regardless of trade affiliations. When the freight rates are amicably adjusted the first cost of an automobile will be materially reduced."

Boston Bars Even Studded Tires.

A number of Massachusetts owners will have to invest in new tires if the edict of the Metropolitan Park Comission is rigidly enforced. The commission, which enjoys privile greater than those of the czar, has rued that no automobiles fitted with not merely tire chains, but with armored or metal studded tires, or other devices of metal, will be permitted to drive on any of the roadways or parkways in Boston under its jurisdiction. An order embodying this

provision has been framed by the commissioners and will go into effect to-morrow (Friday). Violation of the rule is made punishable by a fine not exceeding \$20.

Darracq Files Its Schedule.

Schedules in bankruptcy of the Darracq Motor Car Co., New York, which recently failed, show liabilities of \$61,219 and nominal assets of \$85,232, consisting of twelve automobiles, \$44,867, covered by a bill of sale to the New Amsterdam National Bank as security for a debt of \$11,500; one other automobile not in the bill of sale, parts and accessories, \$16,571; furniture and fixtures, \$1,226; machinery, \$1,421; accounts and notes, \$20,762; cash, \$35, and fire insurance. \$350. Among the creditors are the Michelin Tire American Agency, Inc., \$27,433, mostly for loans; the Electric Vehicle Co, \$3,656; E. Lamberjack & Co., \$2,088; H. L. Toplitz, \$1,643, and Pitt & Scott, \$1,353.

Pitts Jailed at Walla Walla.

William H. Pitts is under arrest at Walla Walla, Wash., charged with obtaining money under false pretenses by swindling Fount A. Butcher out of \$50. According to the information Pitts represented himself as the agent of the Northern Motor Car Co., of Detroit, Mich., and as such offered to sell an automobile to Butcher, on which \$50 was paid in advance. This occurred February 15. The warrant recites that Pitts made false statements when he claimed to be the agent for tehcompany, and that he had no connection with the company. Pitts claims that the money was passed on a business transaction and that he had no intent to defraud.

Salzman Leaves Factory for Retailing.

George Salzman, for six years assistant superintendent of the E. R. Thomas factory at Buffalo, has resigned that position to become treasurer and general manager of the American Motor Car Co., of Atlanta, Ga., agents for the Thomas Flyers. Salzman's splendid driving in the recent Savannah road race won him many friends in the South, and the Atlanta company placed a \$65,000 order with the proviso that Salzman be released to take the management of their company.

New Model Comes from Moline.

"Moline Limited" is the style of a new model which has been brought out by the Moline Automobile 'Co., East Moline, Ill., It has a four cylinder, water cooled, 35 horsepower motor; sliding gear transmission with four speeds; 115 inch wheel base; two systems of ignition, magneto and storage battery, and unit power plant with three point suspension. It will retail for \$2.500

What was the Milwaukee Auto Livery Co., of Milwaukee, Wis., now is the Bland-Mueller Auto Co. The necessary certificate recording the change of name has been filed.

WEST INDIAN COMPANY A FRAUD

Jncle Sam so Brands It—Hatched in Connecticut, Its Promoter Spun South American Tales.

The Postoffice Department has issued a raud order against Frederick U. Wells and the West Indian Motor Car Co., which operated at New Haven, Conn. Wells recently was arrested in Kingston, Jamaica, but later was released.

It is stated that Wells procured a charter under the laws of South Dakota and opened an office in New Haven. He advertised for agents, and to persons replying he would represent that his company had a capital of \$500,000, and branch offices in Porto Rico, Jamaica, Cuba, Nassau, Bermuda, Venezuela, Brazil, Mexico, and the Argentine Republic, and that it was in want of agents.

If the person addressed would only be kind enough to remit the small sum of \$100—as an evidence of good faith on the part of the said person—the company would furnish him employment at the salary of \$1,200 per annum and a free ticket to one of the branch offices of the concern.

The persons who sent in money were badly "stung." The company had no capital stock, except that supplied by the various victims; no plant, no offices, no motors—not even a gallon of gasolene. The officers were either fictitious, or tools of Wells, it is stated.

Wells, who appeared to be about 26 years old, first appeared in New Haven last October, saying that he came from East Hartford. He took an office at 902 Chapel street, and immediately started in to boom his "gilt edged enterprise," the "West Indian Motor Co.," which he claimed had \$500,000 capital, and was the exclusive agent for all the first class cars in South America. His plan was to get chauffeurs to go to Jamaica, offering them large yearly salaries if they would buy stock in the company. As a further inducement he offered to give \$500 worth of stock for \$200. He claimed to have a \$100,000 contract with the government to carry mails from San Juan to Ponce by motor car. Wells advertised extensively for chauffeurs and many went up to his office to consider his offer, but it was just a bit too magnetic, and only one or two were parted from their money.

Wells ordered a number of automobiles from the New Haven dealers, for which he is alleged to have paid with worthless checks; the machines were not delivered.

British Business Falling Off.

British trading in foreign cars and parts has undergone a marked shrinkage since the beginning of the year. During the month of March the total imports revealed a drop of no less than \$311,730, as compared

with the corresponding figures of 1907. In all, only 433 complete cars were imported, their combined value amounting to \$775,785; while 282 chassis, valued at \$397,625, and parts to the value of \$712,510, brought up the total to \$1,885,920. The total importations for the first quarter of 1908, consisted of 1,111 cars, 750 chassis, and parts, the valuation amounting in the aggregate to \$4,-990,315. The corresponding summation of last year amounted to \$5,823,835. In the export field a similar falling away has been experienced, though not to so noticeable a degree. During the month of March, 182 complete cars, valued at 0327,303; 20 chassis valued at \$30,975, and \$161,750 worth of parts were exported, thus bringing the total export figures up to \$520,030. The corresponding figure for March, 1907 was \$552,970. The gross exports for the first three months of the year amounted to \$1,-555,640, as compared with a total for the same period last year, amounting to \$1,588,-

Evidence of Trade's Recovery.

Reports from many directions indicate that the automobile industry, generally speaking; has about recovered from the effects of the financial depression and has regained its tone.

As one instance of the fact, on Friday last, the Maxwell-Briscoe Motor Co. received a telegram from the Fernald Automobile Co., its Denver agent, offering \$50 per automobile for a two-carload shipment—twelve Maxwells—conditional on shipment being made within ten days.

"Nor is Denver the only place that is crying for cars. The demand is simply phenomenal," said Benjamin Briscoe, in speaking of the telegram. "I don't know whether we are doing all the business, but I do know we are producing 50 per cent. more cars this year than last and we simply can't keep up with the demand. A few days ago we got a telegram offering \$500 premium for one car load of six machines—a bid that outdoes Denver. Of course we cannot comply. We've put on night forces at our three factories and hope soon to catch up."

Making Mitchell's Big Plant Bigger.

The Mitchell Motor Car Co. is adding two more buildings to its already big plant at Racine, Wis. Of the new structures one is an addition, 100x100 feet, to the machine room, and the other, 130 by 420 feet, is a warehouse, paint department and metal working department. The factory expects to ship 250 Mitchells this month, but is still far behind its orders.

Angus Flirting with Beatrice.

The Angus Automobile Co., which commenced building cars last year in Angus, Neb., already is seeking a new location. It has told the Commercial Club of Beatrice, Neb., that it is willing to be "induced" to remove to that place.

KELLY HEADS A NEW COMPANY

Becomes President of Big Leckport Concern that will Produce Tires—Its Other Officers and Plans.

Charles F. U. Kelly, than whom few men are better known, is no longer sales manager of the Continental Rubber Works, Erie, Pa. After many years of service in the industry he finally has made a change which places him in a position that will give practically free rein to his undoubted resourcefulness and unlimited energy. He has become president of the newly organized Lockport Rubber Works of Lockport, N. Y., which has been incorporated under New York laws with \$300,000 capital.

The other officials are J. Edwin Davis, vice-president; H. M. Wood, secretary. Mr. Davis, who was at one time treasurer of the Boston Woven Hose & Rubber Co., has had 24 years experience in the rubber industry, in both the executive and manufacturing departments. Experienced men for all other departments have been engaged and President Kelly promises that in about thirty days, when deliveries commence, the tire trade will have something to talk about.

The product of the company will include tires of every sort—for automobiles, bicycles, motorcycles and carriages. Hose, belting and a full line of mechanical rubber goods also will be manufactured.

The factory at Lockport has more than 110,000 square feet of floor space, and is thoroughly equipped with new and modern machinery and appliances.

Death of the Senior Grout.

William L. Grout, known in the automobile industry as father of the Grout brothers, of Orange, Mass., and later as active head of the Grout Automobile Co., died at his home in Greenfield, Mass., Wednesday, 22d inst. Mr. Grout had long been prominently identified with sewing machine interests, his first business connection being with Thomas H. White of the White Sewing Machine Co. His most effective work was at Orange in connection with the New Home works, of which he was superintendent, and with which he was connected for 26 years. He had been an invalid for many years.

New Assemblers in Wisconsin.

E. C. Deibler and T. H. Russell have gone into the automobile business in Berlin, Wis. They are assembling cars on a limited scale from purchased parts.

Carriage Company May Build Cars.

The Velie Carriage Works, Moline, Ill., is reported to be contemplating the manufacture of automobiles. The report, however, lacks confirmation.

"Keep Your Eye on Continentals!"

Continental

In the Briarcliff Race.

More Continentals ran through the Race without trouble than any other tires.

The Continental Ready-Flated equipment received unqualified commendation from every driver using it.

The Briarcliff race was the most severe tire test ever held in this country. It demonstrated once more that Continentals, which hold the world's record for long-distance racing, and which have the largest sale of any automobile tire, are the leaders also in reliability and durability.

NEW YORK, APRIL 30, 1908

Advantages of Displacement Exemplified.

Even a casual glance at the characteristics of the cars which competed in the Briarcliff race furnishes convincing evidence of the absurd methods of engine rating extant among the makers. It also supplies a good argument for the method of rating by piston displacement. Comparison of the figures representing nominal horsepower with those indicating the piston displacement shows a variation which is too extraordinary to be accounted for by any eccentricities of design. Had not the event been a "stock car race," such differences might have been reconcilable to the desire of certain makers to practice the greatest possible fuel economy, and of others to develop the maximum possible power regardless of that factor. With the limitations which are supposed to exist in the design of engines for touring practice, however, the more charitable supposition of the two which are possible is to credit a large proportion of

the makers with extremely liberal ideas as to what horsepower really is.

Reducing the figures obtainable from the entry blanks to terms of piston displacement per nominal horsepower, it is found that the machines entered had cylinder capacities varying from a trifle over 1½ cubic inches per horsepower up to 3 inches and a little over. To see one car with double the rated horsepower of another, yet with only 5 inches more cylinder capacity at once leads to the conclusion that something is radically wrong with the system of rating, and so far wrong that some remedy ought to be discovered and applied without delay.

It is true that displacement alone is not a measure of the possible performance of the car, nor, strictly speaking of the engine itself except in a limited way. With cars of any given class, however, as in this case, the ratio of engine power to car weight, and of displacement to power output, should be so far reduced to a common denominator as to yield at least one term upon which a just rating could be based The contention frequently has been advanced by the Motor World that the piston displacement furnishes just this desideratum. Certainly it is justified by the results of this contest wherein cars ranging in nominal output from 30 to 60 horsepower, and all designed for touring purposes, or at least for road service, proved to be on a pretty nearly even footing.

The inflexibility of the displacement figure is its greatest advantage. By the ease with which it may be checked, all jugglery is barred, and even though it is not a measure of horsepower it is so nearly a measure of it as to be more suitable than horsepower for use in connection with competitions, as it is for general use in the makers' catalogues. Every man understands the meaning of inches; only the technical understand the meaning of horsepower.

Concerning the Change Speed Gear.

In the location of the change speed gear and its relation to the parts which it connects, a gradual change is taking place which is more general than might be supposed by the casual observer, and none the less marked for being unaccompanied by the trip-hammer racket of press agency. Excepting the question as to whether four or six cylinders are more suitable for use in touring car practice, the industry is at present quite barren of the causes for technical argument which one time furnished it with so much of the spice of life. The situation in

regard to change gear position, is only one of several examples of the newer trend of things in which the owner pays less attention to the design of his car than formerly, and more to its performance. Like the problem of the final drive and the relative advantages of solid and live axle constructions, change gear design is being thought out and worked out slowly, but progressively.

Originally, the change speed gear was an element by itself, like the differential, and independently mounted and controlled. Later, it came to be associated in combination, either with the motor in the unit power plant, or with the rear axle group in the unit transmission. Compactness, interchangeability and facility for making repairs, were the principal causes leading to the adoption of one or the other of these systems until at present, a very important contingent of the makers have espoused one or the other. Without going into their respective merits, it is plain to see further, that both stand on a common footing in that they serve to eliminate the several undesirable features which the independent and centrally mounted change gear develop. Indeed, their increased use as well as the arguments in their favor, appear to point to the ultimate elimination of the latter arrangement.

In either case, the use of a single propeller shaft running a considerable distance is made possible, thus reducing the angular displacement of the universal joints, and so cutting down wear, and the strain on the parts due to irregularity in transmission through the joints when disaligned; in both, the parts are made more accessible, more readily demountable and more perfect mechanically speaking; and in both the use of universal joints between the motor or clutch and gear box, in addition to those between the gear box and the rear axle, is done away with. Another bad feature which is also eliminated is the noise of the gears which, especially in the case of limousine cars, is made particularly objectionable because of the resonance of the body. With the gears mounted in the fore part of the car, or on the axle, where the springs are between them and the floor of the body, the clatter and ringing of the transmission is reduced to an almost negligible degree.

These arrangements are peculiar to the gear driven car, of course, and the tendency to a clearing away of the middle portion of the chassis thus may be said to be peculiar-

ly an effect of the shaft drive. Even so, in one or two cases even the chain driven car has been made subject to a unit power plant design, with only the differential housed in the counter shaft casing, so that the movement cannot be attributed exclusively to that source. The rivalry between unit transmission constructions and unit power plants, has not become as strong as it is likely to within a year or two. But whatever arguments may be advanced in favor of either, it should be borne in mind that they have at least one common advantage.

Earning Customers' Good Will.

When a man spends a sum of money for an automobile, whether the expenditure is \$500 or \$5,000, he expects something more from the agent than the tools and accessories with which the car is equipped. The buyer expects—that the expectation is justified—that the dealer from whom the car was bought will have sufficient interest in the welfare of his patron to sincerely cooperate with him to the end of obtaining the best results in the use of the new car.

While any salesman will answer the questions which may be asked him by the buyer, too often the latter has so little knowledge of the mechanism and design of his new car that he fails utterly to bring up the questions that are of first importance. The result is that he experiences a number of mishaps which easily could have been guarded against had the interest of the salesman, in the welfare of his client, been sufficiently sincere to have prompted him to do a little more than was asked by giving the customer enough time and attention to properly instruct him in the construction and operation of the car.

It is short-sighted policy on the part of a dealer to strive merely to get a customer's money. His good will is valuable and while "hell hath no fury like a woman scorned," the automobile agent has no critic like the neglected customer.

Automobile dealers would do well to adopt the policy of one of the best known and most popular of legislators. He was approached one day by a constituent and asked for a card of admittance to the floor of the senate. By way of complying, he made out two cards, which he handed to the applicant, with the terse remark: "You may want to use both." As the recipient of his favor passed out of hearing, the legislator, turning to his friend who had witnessed the occurrence, said, "when I gave him one card, I gave merely what he asked for and

what he was entitled to, and he accepted it as his right; when I gave the second card, which he had not asked for, he appreciated my interest in him and felt under obligation to me. I find it a good principle to do a little more than is asked of me."

Problems of Commercial Vehicles.

Manufacturers of commercial motor vehicles are wont to deplore the difficulties in the way of successful operation of their product which are caused by the difficulty of obtaining satisfactory service from drivers. In some cases they even go to a point further and complain of the difficulty of securing competent operatives for the road testing track. Men who are competent to drive and handle cars of any sort, prefer to drive lighter and more speedy machines, they say, and consequently unless closely watched, will tend to shirk their work when put on the commercial machines, and in many cases "pass them up" long before they are in proper working condition, simply from lack of interest in the undertaking. This is doubtless a very real difficulty, but the root of the matter lies not so much with the men themselves as with their em-

As was pointed out in these columns not long since, the user who is unable to obtain satisfactory service out of commercial vehicles which are of standardized make, must be in some way at fault himself, since others, with similar equipments, are able to obtain paying results from their use. So with the producer of the vehicle. If he is unable to obtain faithful service from his test crew and if his customers also complain of high maintenance cost and labor troubles as well, it is more than likely that the difficulty might be solved by a little attention to detail both in the draughting room and the superintendant's office.

The machine which is properly designed according to the best rules of modern practice, such as are available in every wellequipped manfacturing establishment, is not likely to give any great amount of trouble either under test or afterward, so long as it is run under thorough supervision. Provided the design is good, the only other possible cause of trouble in testing must arise through carelessness in assemblage. The car which is well designed and thoroughly built, if tested under a close system should give so little trouble that the work should be in no way repellant to the competent mechanic. Hence, if paid a proper wage, there ought to be no difficulty in securing

COMING EVENTS

April 29, 30 and May 1, Detroit, Mich.—Detroit Automobile Dealers' Association's three days' reliability run to Saginaw, Kalamazoo and return.

May 15, Algonquin, Ill.—Chicago Motor Club's annual hill climbs on Perry and Phillips hills.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 20, Indianapolis, Ind.—Indianapolis Automobile Trade Association's 160 miles sealed bonnet endurance run.

May 30, Scranton, Pa.—Scranton Automobile Club's hill climbing contest on Scrub Oak mountain road.

May 30, Newark, N. J.—New Jersey Automobile and Motor Club's 12-hours endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30. Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's third annual hill climbing contest up Giant's Despair.

May 30. Baltimore, Md.—Motor Car Racing Association's race meet at Pimlico track.

May 30, Cleveland, Ohio—Cleveland Automobile Club's second annual hill climbing contest.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

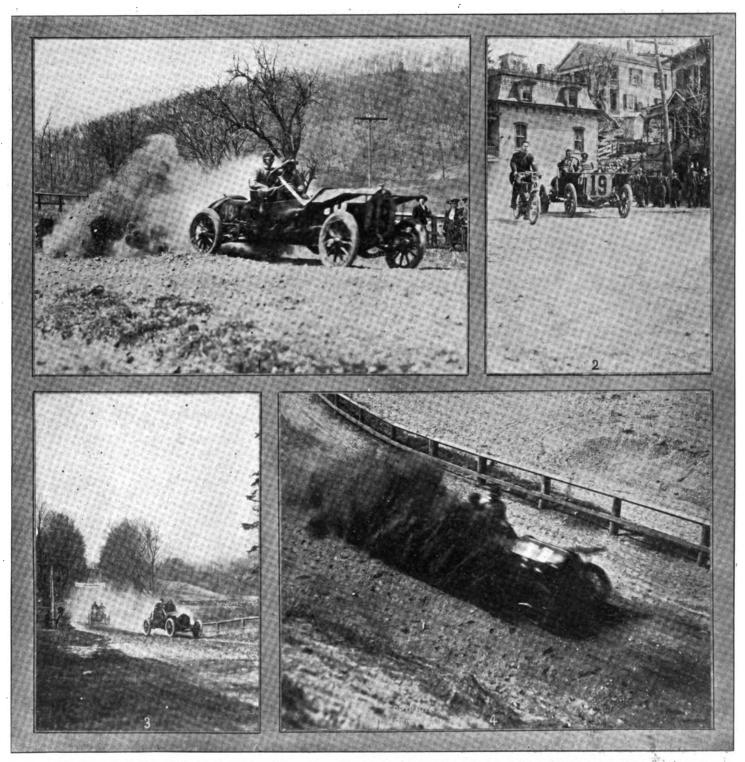

July 9, Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

men for the test crew who would work in well.

As for the dissatisfied customer, under these circumstances, there are two possible sources of his discontent. One, that the vehicle is not suited to his needs, and the other, that he is not sufficiently good an executive to develop the proper returns from it. The maker who is sure of his product, should have no difficulty in locating such a fault, nor, if he be at all wise, in pointing it out to the unsuccessful owner. Where complaints of this nature exist, both the cause and the remedy are not far to seek. Generally speaking, the successful maker is not long in ferreting them out and correcting the underlying evil. The maker who, on the contrary, continues to complain of labor troubles or of the thickheadedness of his customers, is pretty apt to be on the wrong track. He should look to his design and to the manner of its execution first, and complain afterwards.

STRANG WINS WHILE MOORE SLEEPS

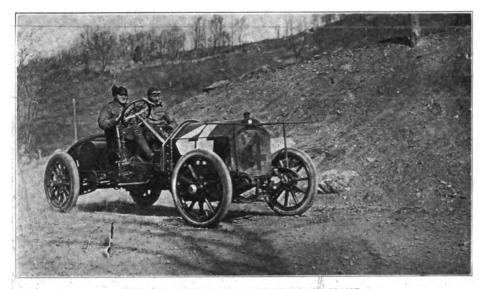

1. HILLIARD "RAISES THE DUST." 2. HOW MOTORCYCLISTS PILOTED COMPETITORS THROUGH MT. KISCO CONTROL. 4. POOLE "SKIDDING SOME." 3. WHEN LYTLE PASSED CEDRINO EARLY IN THE RACE.

God was good on Friday morning last, 24th inst. On that day the first race for the tions, the services of neither the coroner Briarcliff trophy was run over the 32 miles. nor the undertaker, nor even the ambucorkscrew circuit in Westchester county, lance surgeon, were once called into requi-

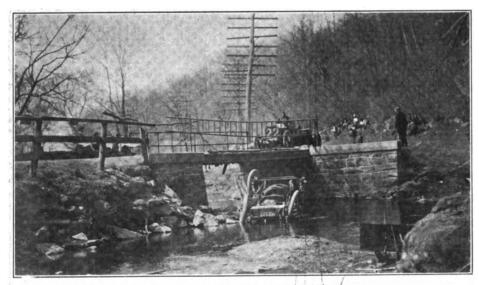

New York, and contrary to all dire predilec-

sition. The absence of serious accident was the most remarkable feature of the day.

The race was won by Louis Strang, an American driving an Italian Isotta car, but

STRANG WITH THE RACE WELL IN HAND.

"THE QUICK AND THE DEAD"—WATSON SPEEDING OVER THE BRIDGE OFF WHICH A CAR PLUNGED THE DAY BEFORE.

THE DRIVER DOES NOT TAKE ALL THE RISKS.

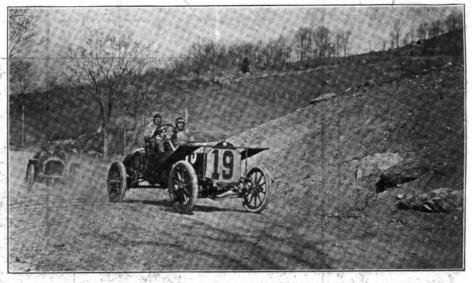

readers of advertisements that since have appeared in the daily press, may be pardoned, if, despite the official record, they have a confused idea as to whom the victory belongs. The importers of the other cars that competed, and at least one American house, have each figured out to their own satisfaction, the marvelous glory that can be squeezed out of a near-triumph, or even out of one that is not remotely near. The figure jugglers and word-compounders have paid large sums for generous space and black type to impress the public with the fact that they did everything but win the cup.

Strang, however, was the only real winner. His victory was achieved on the road and not in the advertising columns. He covered the eight laps-259 miles-in 5 hours 14 minutes 131/2 seconds, an average of about 48 miles an hour-speed which surprised, astounded every one familiar with the twists and turns of the "wriggly" course of indifferent roads. Second was Emanuel Cedrino, on a Fiat car, in 5 hours 21 minutes 53/5 seconds. Strang started fourth and finished first; Cedrino was second away at the start and finished in the same position. The next two finishers were Americans in American cars, respectively, Guy Vaughn, Stearns, in 5:28:293/5, and Herbert H. Lytle, Apperson, in 5:39:153/5.

To whom fifth position belongs is a matter of conjecture. Paul Sartori driving a Bianchi, finished in that position in 5:53:453/5, but J. Morton Seymour, Simplex, drove his car across the finish line shortly after the finish of Sartori, and inasmuch as Seymour started in 21st position, twenty minutes after Sartori, who finished only eight minutes before him, logically the place belongs to Seymour. Following this line of reasoning sixth position apparently should go to Frank B. Leland, Stearns, who started four minutes after Sartori, and finished less than four minutes after the Italian crossed the line. Sartori, who was given fifth position after the premature stopping of the race after this number of cars had crossed the finishing line, apparently should be in seventh place. Whether the position will be changed is a matter for the racing board of the American Automobile Association to decide. It is considering the protests.

A few minutes before Strang dashed over the line that marked the finish, it was announced that after eight cars should have finished the race would be declared over. Strang, Cedrino, Vaughn, Lytle and Sartori finished in succession, and in an instant following the passing of the latter, the narrow roadway was blotted out by the swarming over it of spectators and cars. The yellow flags, significant of danger, were displayed The race was over. At that moment Sey mour and Leland were flying around to ward the finish on their last lap. With the course choked with humanity and machines they had to thread their way to the grand-

stand, a delaying process that lost valuable minutes for them. Both finished but the officials did not take their times. Why, no one seems to know. Whatever the excuse it would appear that fifth and sixth places, rightly belong to Seymour and Leland, respectively.

It was a remarkable race. Of the 22 starters, only four cars were eliminated. When the seven cars had finished ten were on their last lap, while another, driven by William Watson, who had been put out of the running for a time, was still plugging along, though several laps behind. It is a tribute not only to reliability of the present day stock car construction, but to the careful judgment displayed by the competing drivers. They realized the dangerous nature of the course, and—most of them had relatives.

on private property south of the start and finish line. The noticeable feature of these stands was their emptiness.

So many touring cars and pedestrians were on the course at 4.45 o'clock, the official time for starting the race, that it did not actually begin until more than three-quarters of an hour later. Fortunately, there was not a hitch in starting when once the first car was given the word, and at intervals of one minute the remaining 21 contestants began the long and wearisome ride.

It was exactly seven minutes past five when Starter Fred J. Wagner counted off the seconds and gave the word to Sartori, in the Bianchi. Sartori wore a black sweatmen were attired in white from head to foot, including white helmets, from the peaks of which defiantly fluttered long white streamers. Guy Vaughn and Joseph Crawford, Stearns, were eighth away at exactly 5.14 o'clock. Ralph Mulford was at the wheel of the other Lozier car, which started next, and both he and Harry Cobe, his mechanic, were dressed similarly to Michener and his helper.

Daniel Murphy and J. M. Ulrich (Maja), Alfred Poole and T. M. Pepperday (Isotta), Montague Roberts and A. C. Guichard (Thomas), followed in this order. Roberts and his mechanic attracted as much attention as any crew in the race, not alone from the fact that they wore regulation foot ball helmets on their heads, but because Roberts acquired considerable notoriety for driving the only American entry in the

stand at Briarcliff Manor bore a similarity to the starts of the several Vanderbilt cup races on Long Island in every respect save one-there was not the great crowd at the race as have made memorable the Long Island contests. There were not hundreds of thousands of spectators, and of the total number who witnessed the race, the percentage at the grandstand was smaller than at some other portions of the course. At no time was the grandstand in danger of collapsing from overloading; in fact, few more than the box seats were filled. To begin with it was in a bad location, a half hundred feet back from the road, and people could not be blamed for not paying fancy prices for hard board seats when they could witness the passing of the cars much better from the more comfortable seating of their touring cars. If the grandstands had been moved up the hill 50 yards the spectators would have been able to watch the cars for nearly a mile after leaving the tape, but from information gleaned from disinterested persons it was learned that the ground at the very top of the hill, where the stand should have been, did not belong to the man considerably interested in the contest. What was true of the official

stand half way up the hill is equally appli-

cable, but to a greater extent, to the sev-

eral immense stands that had been erected

The start of the race from the grand-

SIMPLEX SIGNALING STATION.

er and Mevers, his mechanic, looked warm in a rubber coat. Emanuel Cedrino and Carlo Catra next breasted the tape in their red painted Fiat; both men wore helmets and red sweaters, with the name of the car in white letters on their backs. Third away was the high-geared Apperson, also painted red, with Herbert Lytle at the wheel and George E. Davis in the seat beside him. Lytle got a big hand when he threw in the clutch and the big machine started feverishly up the incline. Strang and his Italian car were regarded critically when they came up to the line. This young man had suddenly jumped into fame only a month or so ago when he won the great stock car race at Savannah, and the car commanded notice from the fact that it was rigged up with a peculiar arrangement of gas pipe on the front, which Strang explained was to prevent any stray dogs that happened in the way from being thrown up in his face. John B. Marquis was in the mechanic's seat.

Frank W. Leland and Charles Schlipp, his mechanic, were both garbed in black leather suits, as they brought the Stearns, No. 5, to start. Edwin H. Parker, Fiat, was sixth away. Harry Michener and Anthony Ross presented the most picturesque appearance in the long white Lozier. Both

New York-Paris stunt as far as Wyoming.

Whatever the attention Roberts received from the grandstand crowds just as much was focused upon Barney Oldfield, at the wheel of a Stearns. Oldfield, whose daring on circular tracks has made his name known all over the world, was making his debut at road racing, and there were not a few that predicted his early demise. How well the wise prophets went astray subsequently developed. Besides this fact Oldfield nonchalently chewed a cigar butt, an unfailing habit of his track driving, and braved superstition by driving a car with the number "13" painted on its radiator. Oldfield had trimmed his car with splotches of green paint to make it resemble as nearly as possible his famous old "Green Dragon" car. In the seat beside him was Charles Soules, another famous track driver.

Maurice Bernin (Renault), was the 14th starter, and in succession followed George Robertson (Panhard), with Paul Fleury in the mechanic's seat; W. M. Hilliard and Frank Townsend (Hol-Tan-Shawmut); and Ralph De Palma, who had been substituted as the driver of the Allen-Kingston car after A. C. Campbell, the original nominee, had been injured when the car ran off the course during practice the week before. De Palma was to have been the mechanic, but Rippengill occupied that minor role.

Julian Bloch and Charles Godard (Re-

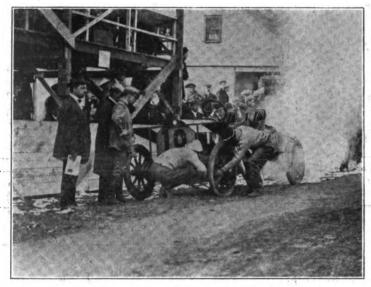

nault), were the eighteenth away, followed by Hugh N. Harding and L. M. Anderson (Isotta); Louis J. Bergdoll (Benz); Morton J. Seymour (Simplex), and William Watson (Simplex). The last car left at twentyeight minutes past five.

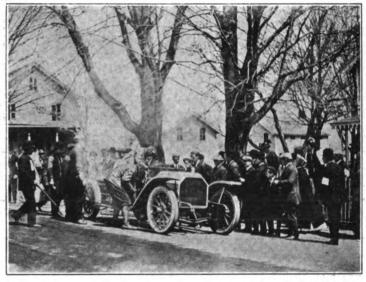

Then the crowd settled down to await results. Predictions were freely made, and one or two bets involving an outlay for soda water were made by excited Italian day laborers that Cedrino would be the first to pass the grandstand at the finish of the first lap. From Briarcliff to Kitchawan is 6 miles, and to Pine Bridge 7 miles, while Mt. Kisco, where the only control was situated, and through which the cars had to take ten minutes to pass, is 11 miles from

in the first round. The road at East View describes what might be called a continuation of nightmareish curves and then some. The twists looked easy from the top of the hill, and one would not know the difference until the centrifugal and centripetal forces began a duel when the car started to wiggle around them. Most of the drivers realized the danger at this point and slowed up before they struck the loops. William Watson, the last man to pass on the first round, didn't, however. The preceding cars had worn a rut in the roadway, and when Watson came whizzing down the hill and ran onto the first curve the outside wheels of his car settled into the rut. Watson instinctively knew that

two minutes back of him, Sartori. The crowd saw some action when a tire of Sartori's machine gave way, just after passing the stand. In order came Parker. Vaughn, Murphy, Poole, Leland, Mulford, Michenor, Oldfield, De Palma, Seymour, Hilliard, Robertson, Harding, Roberts, Bloch, Bergdoll, and Bernin—all save Watson, the first unfortunate. Next to Strang, Seymour made the most sensational run, covering the lap in 39:56, actual time, and jumping from next to last position at the start to 14th place at the ending of the first round.

One or two flashes of near excitement amused the spectators during the early hours of the race. One came when the sheriff of Westchester county made a raid

HILLIARD PUNCTURES AT GRANDSTAND.

LELAND STOPS FOR REPAIRS.

the start. It was thought that the first telephone bulletin would be sent from Mt. Kisko, but the first of the meagre reports that finally reached the official stand was that Vaughn had passed Michener at Armonk, 17 miles. The next announcement was that Cedrino had passed Sartori at Valhalla, 22½ miles. Soon after it was heard that Cedrino, Sartori, Lytle and Strang had passed East View, 26¼ miles, in this order.

Perhaps the most dangerous turns of the course were at East View, where also was a railroad crossing, which was blocked every once in a while by a slow moving special train from New York. Incidentally, these special trains of the New York Central and Hudson River Railroad broke all speed records in getting to the course. Briarcliff Manor station is only a few more than 30 miles from New York City, but it is an actual fact that the train which left Grand Central at 3:15 a. m., did not reach Briarcliff until exactly twenty minutes after seven o'clock.

Because of the serpentine twists of the course just south of East View several thousand spectators, in search of thrills, congregated at this spot. The most spectacular accident of the very few in the race came

he was "in bad" and threw on the brakes, but the speed was too great to be overcome in an instant. As the car reached the curve and the front outside wheels jammed against the rut it was natural that the opposite side should begin to rise, following the first principles of motion. Watson realized his danger and cut out power entirely. The instant he did so the car was describing a flip-flop, and Watson and William Cotter, his mechanic, were looking for a soft landing spot. They found it, and the car settled down bottom side up. Later Watson got the car righted and started in the race, but it was after half-past eight when he passed the grandstand the first time, the leading cars at that time being on their fourth round.

Strang must have done some fast driving in the 6 miles from East View to the grandstand. At that place he was in fourth position, and passed the other three cars before reaching Briarcliff for the ending of the first lap. He passed the stand at 5:59:42, having taken 49 minutes 42 seconds to cover the 32.4 miles, which, deducting ten minutes for the Mt. Kisco control, made his actual time for the lap 39:42. Lytle was only 18 seconds behind. Three minutes later came Cedrino, going great guns, and

on the gambling lay-outs that had been set up back of the press stand. The cappers were "roping in" a lot of innocent countrymen when the big sheriff and his bristling black moustache took a hand in the game. The fakirs were run off the course and the sheriff and his deputies amused the crowd by smashing the rough pine tables with axes.

The militiamen who had been enlisted to keep the course free of spectators were more in the way than of real service. Most of them were mere boys, who apparently had small idea what they were there for. At one time when some one passed a bottle of beer among several of the "volunteers" stationed at the grandstand and, not being used to such strong beverage before breakfast, they began to think themselves excruciatingly funny, and amused themselves by hitting bystanders toes with the canes with which they had been "armed" by the promoters of the race. One of the youngster guards-they were not in uniform-got into a fight with Magistrate Kernochan of New York City and was belaboring him over the head with a cane when District Attorney Jerome, who was with the magistrate, interposed. The over-zealous "soldier" guard received a black eye.

This incident almost started a free-for-all fight among the guards until several uniformed Pinkerton men put the entire company of soldiers to flight. A few minutes before this incident Starter Wagner got into an argument with a chauffeur who wanted to cross the road. The two began pummeling each other until spectators interposed.

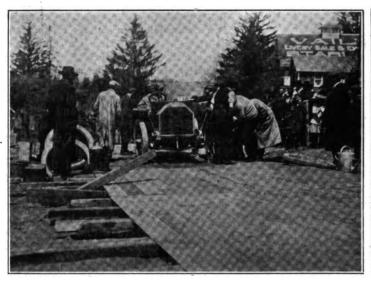

After the first round Tom Moore, the manager of the race, crawled into a tonneau of a friendly car and went to sleep. He slept like one exhausted, undisturbed by the intermittent thunder of the cars as they rolled past. It was no wonder, for Moore and Robert Lee Morrell, who promoted the race, were not sure until the last

that lap being by Strang, in 38:23. Seymour, in the Simplex, had jumped into second place in point of time, with Lytle third and Vaughn fourth. Harding stopped his Isotta car at the grandstand with a flat left front tire. The young Englishman and his mechanic made a remarkably fast replacement in just 2 minutes 21 seconds. In the third round, covered by Strang in 39:18, Seymour still held second position, but Vaughn passed Lytle, and thus moved into third place.

The first real excitement occurred in the third round when four cars came down the winding hill toward the grandstand together. Harding headed the procession with Mulford nosing him closely, and Par-

mud and viewed their lost chance. It was on the fourth round also that Parker (Fiat) retired with a broken rocker arm of a cylinder.

The positions of the three leaders—Strang, Vaughn and Lytle—were not changed in the fourth lap, but the succeeding round brought a shift, Vaughn relinquishing third place to Poole (Isotta), while Lytle moved into second place. Cedrino (Fiat) was fifth in both the fourth and fifth rounds. The fifth round also marked the retirement of two other cars, Mulford's Lozier and De Palma's Allen-Kingston. Both Michener and Mulford had tire trouble in the early laps, the former replacing three tires, while Mulford had to put an entire

OLDFIELD CHANGES A TIRE.

POOLE RUNS INTO TROUBLE.

minute that the race could be run. They satisfied State Engineer Skene, who wanted cash to indemnify the State for damage that the race might cause to the roads, and it was not until late the day before the race that his demands were satisfied. Then on top of that came the announcement that the village of Greenburg had unintentionally been left out of the bond that was to indemnify the towns along the course in case of any damage caused by the race. Personal bonds were given until a cable could be sent to London to insert the name "Greenburg" in the papers. Then it is said that Moore and Morrell did not pull very well together the last day before the race, and, in fact, had had some words. So it is no wonder that Moore slept.

When Strang passed the grandstand at the ending of the second lap at 6:48:02, his total time for 64.8 miles being 1 hour 18 minutes 5 seconds, and when he still held the leading position at the finish of the third and fourth rounds the spectators began to realize that barring accident, Strang would likely prove the winner. The fight was for second place, and in the scrimmage for this position was found the only excitement of the race.

All the cars save one made the second round without incident, the fastest time for ker and Oldfield were only a few yards behind. The last named made a daring swerve and passed Parker directly in front of the stand, a little byplay that caused the spectators to rise and cheer the veteran circuit chaser. This was the one illuminating incident of the race, as viewed from the grandstand.

While the cars were on the fourth round the news sifted in to the grandstand that the front wheel of No. 10 had collapsed at the schoolhouse corner, but that no one was hurt. No. 10 was Murphy's Maja. Later it developed that Murphy's over-ambitiousness to pass Sartori on the serpentine East View hill had brought about his undoing. It happened very near the spot where Watson's Simplex had turned turtle in the first lap. Sartori came shooting down the hill and close behind him was Murphy. It occurred to the Irishman that he would pass the Italian right on the curve—an attractive idea that didn't work. On the skidding side was a ditch and beyond that a stone wall. Murphy jammed the brakes when the car began to slide and this saved it from gointo into the wall. It took the ditch, however, and the one of the front wheels collapsed. Murphy exercised his vocabulary to a considerable extent when he and his mechanic picked themselves out of the soft new equipment on. The fact that he had to do it entirely with the aid of his mechanic as the mishaps occurred some distance from a Diamond tire control, naturally made him lose much valuable time. After replacing the fourth tire, Mulford's mechanic started to crank the car, when the engine back-fired. The starting crank knocked the mechanic unconscious and he remained in that state for more than ten minutes. After that Mulford retired.

Shortly after feaving Armonk the right front tire of De Palma's Allen-Kingston gave way and before he could recover the car had run off the road and over a water culvert. The culvert bent the axle to such an extent that steering was impossible and De Palma was out of his first automobile race.

It was in the sixth round that Cedrino began to set a fast pace. Up to this time he had been driving a conservative race, but in the sixth round he took all kinds of chances. His dare-devil driving was apparent for he worked up to third position at the end of that round, Strang and Vaughn preceding him. Cedrino's time for the sixth lap was 37:16, the fastest lap of the race up to that time. Poole was fourth and Lytle fifth. Seymour, Leland and Sartori followed in order, and then came Harding.

Michenor, Oldfield, Hilliard, Bloch and Bergdoll, in this order.

Cedrino's fast driving in the seventh round landed him in second place in that lap, having passed Vaughn, in the Stearns. It was just 10:53:47 o'clock when Strang passed the grandstand on his last lap, a big green flag giving him the signal. Strang slowed down somewhat for he knew he had the race won then; but not so Cedrino. The Italian flew around the dangerous curves with reckless abandon, resulting in the fastest time for a single lap in the last round, his time being 36:483. At the eleventh hour, by the way, the distance was reduced from ten laps to eight.

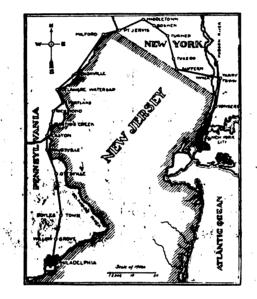

According to official time it was 11:44:131/5 when Lewis Strang crossed the finish line, having covered 257 miles in 5 hours 14 minutes 131/2 seconds, far better time than any one had thought possible. Less than five minutes later Cedrino thundered past. At two minutes past twelve Vaughn's time was taken, and Lytle in the Apperson followed six minutes later. It was nearly 21 minutes past noon when Sartori finished and the instant he had crossed the line the crowd broke loose, despite the announcement made a few minutes previous that the times of the first eight cars would be taken. The guards and officials made no attempt to hold them in check and the result was that Seymour and Leland, a few minutes behind, but coming on fast, had considerable difficulty in reaching the stand at all, so congested was the course with cars and pedestrians. Both the American cars that finished were fitted with Diamond tires.

The aftermath of the race took the form of the usual round of complimentary dinners, which were genuinely full of thanksgiving, because the contest passed over without a serious mishap. The first of the "spreads" took place at Rector's on Saturday night, when Guy Vaughn, Barney Oldfield and Frank Leland were wined and diner and promised special watches each, as testimonials from the firm whose cars they drove. The largest gathering assembled at the Hotel Astor on Sunday night, when 46 banqueters told Fred J. Wagner, the official starter, what a "good fellow" he truly is. In proof of their esteem they presented "Wag" with a gold split second watch. But Chairman Robert Lee Morrell came in for one of the largest wine-sprinkled bouquets that was thrown: He was referred to as the "Little Napoleon of American automobile racing," which made the Briarcliff race worth all it may have cost him. It isn't often that a driver is banqueted when he has not done anything but that was what happened on Tuesday, when a dinner was given in honor of Arthur Campbell, who was put out of the race before it was run by the upset of his car and breaking his jaw. The amusing part of it was that Campbell was still in the hospital at White Plains and so could not join in the festivities in his honor.

BOW TO AVOID NEW JERSEY'S GRIP

Johnston Discovers a New Route to Philadelphia — Longer but Far More Beautiful than Old Way.

Senator Frelinghuysen, having decided that no native shall use the roads of the State—into which he goes for the purpose of legislating when his business and home cares in New York City will permit—without paying heavily for the supposedly inherited right to use the public roads, and that no non-resident shall ride in New Jersey without paying a heavy admission

fee and securing a passport, may live to see the fruits of his "shakedown." Already they are beginning to ripen.

The Federation of American Motorcyclists had planned to spend a day on the roads of New Jersey during the annual meet in July, but since the passage of the Frelinghuysen amendments, New Jersey has been abandoned. Long Island will derive the benefit of the motorcyclists' patronage. The motorcyclists cannot see the wisdom of requiring their visitors—many of whom may never enter New Jersey again —to pay \$2 for the privilege of a few hours' sojourn in that State.

Another result of Frelinghuysenism which will be appreciated by the New Jersey hotel keepers is that a route has been found to Philadelphia and other points which avoids the necessity of passing through the State which claims from \$5 to \$19 for the privilege of using its roads, whether for but one day or 365 days. To that indefatigable tourist, R. H. Johnston, who is chairman of the Good Roads Committee, is due the discovery of the new route which skirts the northern boundary line of New Jersey and then crossing from Port Jervis. N. Y., into Matamoras, Pa., goes in almost a straight line to Philadelphia. So far as beauty of scene is concerned, the new route is so very much more picturesque than the shorter road through New Jersey that the latter is not to be mentioned in the same breath. The accompanying map shows the route. Johnston describes his "voyage of discovery" as follows:

"Leaving New York in our 30 horsepower White steamer, we first proceeded to Tarrytown. Here we were ferried across to Nyack on the opposite shore of the Hudson. The ferry runs on practically an hourly schedule, the fare for car and passengers being \$1. From Nyack we continued almost due west to Suffern, and then, turning north, we continued up the beautiful Ramapo valley, passing through Tuxedo and Southfield to Turner. Here we turned from the main north-and-south route and struck out toward the west. We made quick time through Chester and Goshen to Middletown where, turning to the southwest, we traveled via Otisville and Huguenot to Port Jervis. Much to our surprise, we found the roads up to this point almost perfect."

"At Port Jervis we crossed the toll bridge over the Delaware River and entered the State of Pennsylvania. Then commenced our ride down the valley of the Delaware. On one side of the road rise towering cliffs, strongly suggestive of the Palisades and doubtless of the same geologic origin. Far on the left, on the other side of the river, may be seen the hills of inhospitable New Jersey. The scenery is as fine as can be found anywhere within a day's ride of New York, barring, of course, the Hudson River scenery.

"We spent the night at Milford, 104 miles from New York, and the next morning comtinued down the valley. Thirty-three miles below Milford we came to the Delaware WaterGap, where we lingered for an hour or so enjoying the beauty of this great natural curiosity. Fives miles below 'The Gap,' at the town of Portland, the road leaves the river and then come ten miles of road where we found the first waterbreaks seen on the trip. At Martin's Creek, the road again comes back to the river's edge, and there is a fine eight mile stretch of macadam to Easton, and this river road continues another twelve miles south of Easton. Then the road bears inland and thereafter we did not again see the Delaware. After leaving the river, the scenery becomes rather uninteresting and the road is of varying character. But as one nears Doylestown the good roads begin again, and a fine macadam highway led up through Hatsboro, Willow Grove and Jenkinstown; and then along the York road into North Broad street, Philadelphia.

"We had started only with the purpose of finding a good route to Philadelphia which would not pass through New Jersey. Not only had we fully succeeded in this task, but also we had found as interesting a two-day tour out of New York City as the most exacting tourist could ask for. On the entire 225-mile trip, we found only about 30 miles of poor roads."

ONE MORE USE OF THE MANOMETER

As a Speed Indicator It Fooled the Fledgeling Cop—How It Measured the Car's "Mileage."

"That article in last week's issue of the Motor World headed 'Varied Uses of the Manometer,' recalls a funny incident that happened to me last summer," remarked a professional chauffeur. "I found use for the manometer one afternoon which is not spoken of in the article referred to, and while my tale will sound highly improbable it nevertheless is true and can be vouched for by four people who were in the car with me at the time of the occurrence.

"I was driving a Panhard at the time. The manometer on the car had been out of adjustment for several weeks and when the engine was at rest the indicator would point to about 2 instead of 0—which was a fortunate thing for me," chuckled the speaker.

"On the afternoon in question I was indulging in a joy ride' with friends as passengers; we were going along one of the suburban streets at a pretty good clip when suddenly there appeared before me a youthful cop, who, with outstretched hand, signaled me to pull up. I obeyed the order and was informed that I was under arrest for exceeding the speed limit."

"The cop was little more than a kid and the newness of his uniform together with his very apparent air of serious responsibility, convinced me that he was new to the force, hence it was likely he could be bluffed. Anyway, as no harm could result from attempting to bluff him I concluded to try it.

"How fast was I going?" I asked.

"Eighteen miles an hour," was the response, as he looked at his watch as though for verification of the statement.

"Sure?" I queried.

"Sure," he responded, good naturedly. "Didn't I hold a watch on you?"

"During the conversation I had stopped the engine.

"Well, if you want me to go to the station house, I'll go, but I'm giving it to you straight, that when the sergeant sees my speed indicator he'll give you the laugh and turn me loose. Do you know anything about automobiles?" I suddenly asked, and without waiting for his reply, I continued: This is a French car, and that thing there-I pointed the the manometer-is the most perfect speed indicator in the world. You can see for yourself that there are no wheels or clumsy mechanism connected with it-just a pipe that goes straight to the engine. And you can't change that to save your life," I added in a tone of conviction.

"The cop was interested and I saw that I had him guessing. We were alone on the

road; no rubbernecks had come up to listen to the discussion, and my chances to win out were good.

"Do you see that hand?" I asked himpointing to the indicator which was stationary and pointing to a spot a little less that 2. "Well that shows the fastest speed I've gone to-day, and there's no way of setting it back either. You see it points to a little less than 2 manometers, and a manometer is just six miles. The fastest I've gone to-day is about 11 miles, and any man who understands automobiles will swear to that. Now you take me in and I'll call the sergeant's attention to that manometer and you'll loose your credit for timing automobiles if you make a break like that."

"I was terribly in earnest and appeared so confident that the policeman weakened. He looked about for a minute and seeing that we had attracted no attention from others he concluded that he had made a mistake.

"All right," he said. "Go ahead; you weren't much over the limit anyway."

"I cranked the engine and off we went, happy and suppressing the howls that later rent the air, when the minion of the law was out of hearing. I'm ashamed to confess that later of that same day I drove as fast as 8 manometers an hour."

White Helps Out Wilkes-Barre.

The last obstacle to the annual Wilkes-Barre hill climbing contest was removed this week when Walter C. White, formally withdrew the protest he had made to the racing board of the American Automobile Association in connection with the climb last year. White was barred from the freefor-all event after his entry had been accepted, but as he made the fastest time of the day in a special trial, he put in a claim for the cup. The governing body upheld White and directed the Wilkes-Barre A. C. to award the prize to White. As it already had been awarded to the Matheson, which made the fastest time among the gasolene cars, the club made a compromise with White by presenting him with a gold medal and changing the inscription on the cup to read "the fastest time made by a gasolene car." The last obstacle having been removed the Pennsylvania club will announce the program for this year's climb, which will take place on Giant's Despair mountain on the morning of May 30th.

Strang to Drive in Grand Prix.

By winning the Briarcliff trophy race last Friday Lewis Strang jumped into fame which brought almost instant recognition. He was immediately engaged by Harry Houpt to drive the latter's Thomas car in the Grand Prix race to be run in France early in July, for which task Montague Roberts originally had been chosen. John Marquis, who acted as Strang's mechanic in both the Briarcliff and the Savannah races, also was engaged to act in a similar capacity in the Grand Prix race.

ONLY THREE FAILED TO FINISH

Norristown Endurance Run Proved Mere
Jaunt, and Left Sixteen Clean Scores

—License Plate Caused Accident.

So far as honors are concerned the first annual endurance run of the Norristown (Pa.) Automobile Club from Norristown to Lancaster and to Reading and return on Tuesday last, 28th inst., resulted in a satisfactory evenness which likely will result in the contest being run over. Of the 33 starters, but three failed to finish, and of the remainder, 16 ended the 132 miles run with perfect scores. The trophy is a valuable cup and a meeting of the tied contestants will be held next week to determine the final disposition of the trophy.

The endurance run started from Norristown at 8 o'clock, the route taking the cars over some of the best but hilliest roads in that section of the Keystone State. They all ran upon a time schedule that was easy for the first two stages, one hour and a half from the start to Coatesville and the same time from there to Lancaster, where the dinner stop was made. The roads between Lancaster and Ephrata and the latter place and Reading were such that all of the one hour and forty minutes were needed to get to Reading to Pottstown and from there over the homestretch to the finish.

The run was marked by two accidents, neither of which resulted seriously. One happened to F. M. Jacquith, whose Crawford car was stopped by tire trouble at Great Valley Church. Jacquith stepped back from his stooping position at the rear wheel just as Van Peacock (Packard) came along at a fast clip. A mud guard of the car hit Jacquith and he was sick for some time, but recovered sufficiently to finish the run. As the result of the front license tag becoming caught in the steering gear the Acme, driven by John L. Scull, became unmanageable near Reading and ran into a fence, disabling a front wheel. Scull was not unseated however, and the car was repaired sufficiently to finish the run.

The drivers that finished with perfect scores, and their cars, are:

William P. David, Maxwell; Van Peacock, Packard; D. F. Templeton, Reo; J. Elwood Lee, Cadillac; Frank Stretzinger, Mitchell; Charles Mann, Buick; Frank B. Wildman, Stoddard-Dayton; W. C. Longsterth, Maxwell; J. A. Beidman, Reo; J. E. Mountain, Winton; Walter Cram, Mitchell; Joseph F. Graham, Ford; A. H. Bitner, Rambler; M. B. Brown, Rambler; Harry Greenwood, Premier, and E. C. Benson. Apperson.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

FLAG PRESENTATION FOLLOWS FIRE

Stoddard-Dayton Workmen Celebrate Factory's Quick Rise from Ashes—Sentiments that were Exchanged.

That labor and capital peacefully can go hand in hand was exemplified last week when the employes of the Dayton Motor Car Co. presented to their employer the flag staff and flag which waves over the new

we wish all success and prosperity to the company for which we are working."

Mr. Stoddard received the gift and showed clearly his appreciation in thanking the men for this, another testimonial of their good wishes. He said:

"When a few weeks ago we were gathered here watching the lurid flames leap skyward, threatening with destruction this plant, sadness was in our hearts, and when morning dawned and we could see the havoc wrought by the flames, were we

PRESIDENT STODDARD ACCEPTING THE FLAG.

concrete factory which has just been reared in Dayton, Ohio.

Before the smoke of the recent fire had cleared away, the work of rebuilding the Stoddard-Dayton plant had begun. As it began to assume shape, the workmen conceived the idea of signalizing its completion by presenting an American flag to mark the quick rise from the ashes. A committee was appointed to forward the plan, which was carried out without knowledge of the company's officials, until the proper moment.

Then George Harrison, chairman of the flag committee, presented the flag and staff to the company, the flag raising being made quite an occasion. In turning over the flag to J. W. Stoddard, president of the company, Harrison said:

"May the emblem signify that all our requests be made with justice and reason and that we shall seek to secure our rights through peaceable and statesmanlike means. In short, the stars and stripes symbolize the man, who, with clear brain and skilled working hands, is step by step developing a higher and richer manhood. As employes,

downhearted? A hundred times No. Every man of you responded to the call and with unswerving loyalty threw himself unreservedly to the task in hand with the result that within two days we were again producing the best car that money can build. In accepting this flag it is my desire that as often as we see it wafted to the breezes it may remind us that our interests are common, we must be partners in the business, and with each one being fair and honest with the other, the kindly spirit existing to-day will live on and on."

The Loaning of a Garage.

When the manufacturers at Walla Walla, Wash., recently decided to hold an exhibition there to stimulate interest in home products, they were in a quandary for lack of a suitable building, until the Inland Auto Co. turned over their garage for the purpose. The show lasted three days and music was furnished afternoon and evening. Bread-making contests and baby shows were special features, and although automobiles are not produced in Walla Walla, the company made the most of the occasion.

HERE'S SUBSTITUTE FOR "TAXICAL"

It Comes All the Way from China and Affords a Choice Mouthful—Chinese as
Inventors of the Taximeter.

Company promoters who are in doubt as to the proprietary strength of the word taxicab, well may avoid all chances of infringement by having recourse to the significant and euphonious term "giligulicha." It would appear that the term is perfectly justifiable under the circumstances.

In an "Oriental contemporary," the Scientific American has discovered a statement to the effect that "the Chinese can prove, from one of their old richly illustrated historical works, that already in the eleventh century they were using a 'giligulicha' (or counting mile drum car) "which possessed many taxicab features.

"Judging from the several illustrations of the 'giligulicha,' contained in the famous 'Tsan-thu-hae' collection of pictures, the vehicle had one single pole or shaft, ran on two wheels and consisted of two stories," it is explained. "In each of these compartments or divisions ther was a wooden figure holding a mallet in the right hand; these mallets were arranged to strike upon a drum in the lower story, and upon a gong in the upper one. When the vehicle had traversed a certain predetermined distance, the lower figure struck the drum with its mallet, whereupon a cog-wheel made a revolution. When a distance of ten miles had been covered the upper figure struck the gong with its mallet. In some cases this Chinese taximeter car was also fitted with a compass which, owing to the total lack of landmarks and signposts, was of great value to the Celestial 'chauffeur' of that time. A magnet was also provided: it was located in a small box. and influenced a block upon which there was fastened a small jade or wooden figure the outstretched arm of which always pointed due south."

Keeping Tabs on Municipal Cars.

Municipal automobiles in the city of Glasgow, have been more or less subject to the nocturnal abuses which have been supposed hitherto to be a purely American characteristic in this connection, or so it would appear from the recent announcement of a proposed reorganization of the city's motor service. Hereafter, each car will bear the words, "Corporation of Glasgow," conspicuously and permanently displayed, while each will also be equipped with a speedometer and odometer. Every driver will be required to maintain a regular log book, and "show cause" for every mile traveled. Furthermore, the mileage will be debited to each department, in common with the cost of operation. ["New York (N. Y.) papers please copy."]

WORM DRIVE FOR ELECTRIC CARS

This, and Other Innovations Mark Maxim's

Most Recent Creation—How They are

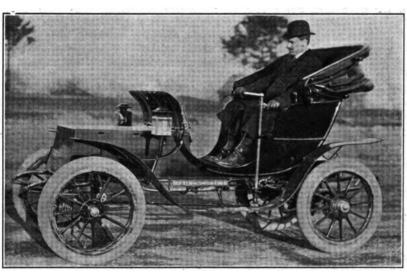

Put into Practice.

Whatever may be said of the degree of individuality still apparent in the construction of other types, electric vehicles have come to be standardized to so high a degree that even a comparatively slight deviation from common practice is at once marked as conspicuously radical. On this account the long-promised Maxim-Goodridge electric victoria phaeton, which is distinctly novel

formed is unusually compact, as shown in the accompanying illustrations, both individually and assembled in the car. Furthermore, it possesses the advantages of eliminating the necessity of using countershafts, chains, strut rods, and housings or adjustments for such parts, all of which are in addition to the benefits in smoothness of action and noiselessness due to the use of the increasingly popular worm drive, which is here used for the first time in electric vehicle practice.

In connection with the arrangement of the transmission, the design of the rear axle is remarkable in that it is "cranked" in order to furnish the rigidity and simplicity of the ordinary dead axle, together the arrangement of the entire vehicle, which is noteworthy for the absence of undermechanism, as well as for the uniformity of the clearance. The only visible under parts are the transmission unit, which, as before indicated, is completely housed, and the steering connections, in addition to the axles and the two stub driving shafts with their universal joints.

Another unusual feature of the machine is the method of placing the battery, which is mounted in a single group under a hood, in front of the dash board, and on the chassis level. This arrangement not only provides for convenience in handling the cells, but has been adopted, as is explained, as the only available method of equalizing

MAXIM AND HIS NEW CAR

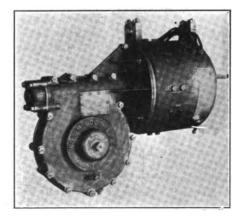

C 6352

NOVEL REAR AXLE CONSTRUCTION

in several respects, is destined to attract no small amount of attention. In fact its expected advent has been awaited with no little interest ever since Hiram Percy Maxim, one of its inventors, severed his connection with the Electric Vehicle Co., and joined with T. W. Goodridge in forming the Maxim-Goodridge Co., of Hartford, Conn., whose first product, the phaeton in question, has just been completed.

Differing in a number of points from ordinary practice, perhaps the most striking departure from precedent is found in the transmission details of this vehicle. A single driving motor is employed, which is of the iron-clad type, placed with its armature running lengthwise of the car. The entire gear reduction, which is of 10 to 1, is secured by means of a worm and gear transmission, which is housed in a divided casing secured to the motor housing, the entire group being suspended from the chassis quite independent of the running gear. The drive to the rear wheels is established by means of two differential stubs which are coupled to the ends of the differential within the housing at one end, and to the wheels at the other. Each of these shafts is provided with two universal joints, to correct for disalignment due to spring oscillation. The motor and transmission unit thus

with the mechanical advantages in other respects of the live type. Instead of being cranked downward in the center, however, as is done in certain systems of axle-mounted transmissions, the main portion of the axle is bent forward of the housing which covers the driven and differential gearing, thus affording ample room for spring mo-

MOTOR AND TRANSMISSION

tion without any possibility of "grounding" the transmission on the axle.

The high road clearance which this construction permits, is further carried out in

the weight destribution on the front and rear axles. Instead of a variation in axle load whereby the rear axle is given some 60 per cent. of the total burden, the excess load on the rear axle is claimed to be only 35 pounds when two passengers are in the seat.

This equalization of weight, as well as the long wheel base (84 inches), and the use of very long springs, makes the vehicle sufficiently easy riding to permit the adoption of solid tires. The wheels are 32 inches in diameter, and $3\frac{1}{2}$ -inch tires are applied, whether of the solid or pneumatic type.

The unusual nature of the machine as a whole is completed by the adoption of a special and original type of controlling mechanism which centers about a single column mounted at the left side of the seat and running down outside the body. This comprises the steering post to which the horizontal tiller is attached above, and also an external sleeve, worked by a short handle under the tiller and actuating the controller. This arrangement does away with the need of disturbing the seat construction in order to permit the erection of the usual vertical controller handle, placing the entire controlling mechanism out of the range of possible accidental disturbance when the machine is at rest. The manner in which

this feature has been worked out is apparent in the accompanying picture which also shows Mr. Maxim in command.

The standard equipment comprises a 30-cell, 11p.v. Exide battery, General Electric motor, and new style "uninterrupted torque," multiple series controller, affording 5 forward speeds and 3 reverse. The total vehicle weight with this battery equipment is 2,100 pounds, and the maximum speed is 18 miles per hour. On ordinary road surfaces a 50-mile radius is possible with either solid or pneumatic tires. On city pavement the radius is correspondingly increased.

Safe Guarding the Steering Connections.

Failure of the steering connections through the giving way of one or another of the ball and socket connections, though comparatively rare, is sufficiently serious in its nature-even as a remote possibilityto be carefully guarded. In a very few instances the makers make some provision of this nature in the design of the connections. In the majority of cases, however, either a great amount of wear in the joint, or the breaking of one of the arms close to it, is liable to wreck the machine. As a measure of precaution, it is possible to attach a couple of clips to the rod and arm, just back of each joint, connecting them with a helical spring of sufficient strength to hold up the rod in the event of failure in the joint, or to use a plain wire connection of a similar nature Another possible method of protection, which in many respects is even better, is to use a protecting boot for the joint, which is made of heavy leather, and is so secured that in the event of the failure of the joint the rod will be kept from falling. The looseness of the connections in such a case will give immediate warning of the need of bringing the car to

Care that the Hub Caps Require.

That the large ornamental hub caps with which most automobiles are equipped, have a purpose, aside from serving as ornamentation, is not known by all drivers. While these caps add to the general appearance of a car, they have also to do with the lubrication of the wheels, and their utility as a reservoir for grease probably is more the reason for their use than is the fact of the attractiveness to the eye.

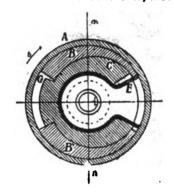

When putting a car in commission, and occasionally, say every month or two, the interval depending on the amount of use the car is given, the hub caps should be thoroughly cleaned out, all the grease and verdigris removed, after which the caps should be repacked. It also is well to clean out the hubs and bearings, washing them thoroughly with gasolene so that dirt and grit will be dislodged. When this has been done, the moving parts should again belubricated, the hubs caps put back in place and the car can be driven without fear of trouble from improperly lubricated axles.

THE MOTOR WORLD

ADAPTATION OF THE CONE CLUTCH

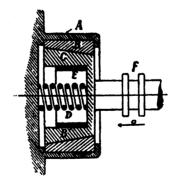

Foreign Device Which Incorporates a Double Wedging Action—Other Features that are out of the Common.

Although the principle of the plain cone friction clutch has proved to be successful insofar as the ordinary driving action is concerned, numerous devices exploiting other principles, as well as the many modifications of the cone principle itself, attest to the fact that when it comes to the action of engagement, the simple type, common as it is, leaves much to be desired. Of the modifications of the cone idea, not a few

involve a reduplication of the wedging action which is achieved in the plain cone. Of these, one of the most recent to appear in foreign practice is the Michel clutch, which has recently been introduced in France by the Ateliers Rondet-Schor, of Paris.

The Michel may be described briefly as a cone clutch of the ordinary type, but of small diameter and heavy construction, in which liners are interposed between the male and female members. Instead of being circular in section, these are of tapering thickness, and made to correspond with

similar tapering seats in the male member of the group. The effect upon entering the principal member is first of all, that of engagement between the driving and driven elements in the ordinary way. The contact thus secured is not sufficient to secure a positive contact, however, and a small amount of slip occurs. This is sufficient to cause the liners, of which there are two, to creep along the surface of the male cone sufficiently to cause their enlarged por-

tions to jam the two elements firmly together with a powerful wedging action. This method of contact, while affording an absolutely positive and non-slipping connection between the elements, would be useless for the purposes of the motor car builder, were not the male member also coned in the direction of its length, as already indicated. This permits the mechanism to be disengaged at any time, and with no more than the ordinary tendency to seizure.

The general arrangements of the parts may be seen from the accompanying illustrations, which show the parts in end and side views. At A, is the outer casing of the device, corresponding to the fly wheel in the ordinary car clutch. The male cone, C, instead of being concentric with its axis, is made partially eccentric, and is shaped to receive the two liners or shoes, B, B', which are of aluminum, and faced with fiber contact strips. The usual helical engaging spring, D, is mounted within the device, as in the ordinary type of "inverted" cone clutch. A plate spring at E, serves to limit the travel of the liners in an elastic manner, while the stop, G, on the cone C, prevents the lower of the two shoes from exceeding its proper length of travel.

When the fly wheel or drum is turned in the direction of the arrow, the motion to engage, which merely serves to seat the cone, C, does not secure the positive driving connection because of a slight amount of play between the shoes and the drum, A. There is enough friction between the shoes and the inner surface of the drum to drag the former around the cone by a very slight amount, this motion being resisted finally by the spring, E. The effect is to wedge the parts firmly together, but with a gradual action which invariably requires a certain amount of time, and therefore invariably prevents straining the transmission. The rate of engagement is regulated to a certain extent by the quality of lubricant with which the outer casing is filled, a certain mixture of kerosene and heavy oil of just the right consistency being employed. As a safeguard against seizure of the parts, it is evident that the withdrawal of the cone in the direction of its axis may be accomplished at any time and with a comparatively slight amount of resistance, which is completely overcome the instant the clutch leaves its seat.

To Brighten the Aluminum.

For brightening the appearance of motor base, transmission case and other aluminum parts, this mixture is recommended by one who has used it:

This brightens the aluminum work, giving it a finish like new, but in using the preparation, care should be exercised not to get any of it on the iron or steel work, and it should be applied only with a bristle brush.

FRELINGHUYSENISM IS IN FORCE

New Jersey's Amended Law Operative, but Licenses not Ready—Temporary Receipts and Other Expedients Used.

Although the fact is not generally understood among motorists the new amendment to the New Jersey law, framed by the New York City representative in the Senate of that State, already has gone into effect. Like the original Frelinghuysen act, to which it is an addition, it contains many more or less involved provisions which will cause the Department of Motor Vehicles and motorists generally much annoyance unless thoroughly understood.

As soon after the law was signed and new stationery and blanks could be obtained the various agencies of the department started to issue temporary licenses which are only makeshifts until the provisions of the law can be complied with exactly. Unfortunately, the amendment did not set some future time at which it shall go into effect, thus giving the department a chance to understand its provisions thoroughly and to get in readiness to enforce them. In consequence the department has developed a temporary system which is working well.

Until the new license tags issued by the State are received, which will certainly not be before the 5th of May, the department issues a receipt to each motorist desiring to license a car not already recorded and assigns him a number. This number he may display on his machine in any legible way he choses until the tags arrive, while the receipt is accepted in lieu of a regular license.

When the license tags are received by the agencies of the department, holders of the receipts must call and receive a regulation license and two tags, which must at all times be attached to cars while operated in the State. Licenses issued now are good only up to December 31 of this year, when they must be renewed.

The new license tags now being manufactured and expected to arrive the second week in May, are blue in color, with white lettering. They will contain the license number of the machine in numerals four inches high with one-half inch stroke; the characters "N. J." and "'08," and a blank space will be provided in which will be stenciled the manufacturer's number of the car for which the license is issued. Each agency will be provided with a stenciling machine, and as a number is assigned the man taking out the license will be required to make affidavit as to the correct number of the car.

As each license issued under the old law is renewed a new number will be assigned and the requisite tags issued to accompany it. No numbers under 38,000 will be given out, so that those members of the

Jersey motoring fraternity who have prided themselves upon possessing some of the early numbers will boast no longer.

A feature of the law which is finding little favor is that requiring that there shall be no transfer of licenses from the old law to the new—that is, if a man wishes to sell a car licensed under the previous act, he will be unable to transfer his license to the new owner by payment of \$1 as formerly. The new owner will have to take out a license under the 1908 law as though the machine had never been licensed. If, however, a car has been licensed since the new law became operative, then its license may be transferred as before by payment of the \$1 fee

A provision which will work hardship in many cases requires that licenses under the old law expiring before January 1, 1908, shall be renewed up to December 31, 1908, at the new schedule of license fees, ordinarily required for a full year's license. An example will best show the working of this. If a man registered his car November 31. 1907, under the old law, that license is recognized up to November 31, 1908, but on that date a new license must be obtained under the provisions of the Frelinghuysen amendment just passed. This amendment, however, stipulates that every license obtained on November 31, 1908, for which full license fees were paid, becomes void on December 31, and the motorist must pay for one month's use of his car the license fees usually exacted for a full year.

Many motorists thought, after reading the provisions of the amendment, that if their cars were registered previous to June 1 of this year they would not have to display the license tags issued by the State. But such is not the case. The law is a trifle ambiguous in one place, but goes on to order definitely that after June 1 only the State tags be displayed on all cars, no matter when registered. These will be furnished by the State, without added cost, when the licenses are issued.

Motorists Escape Massachusetts Squeeze.

For the present year Massachusetts automobilists escape the additional taxation that Governor Guild thinks they should bear. In spite of the report, "no legislation made to the House of Reprenecessary," sentatives by the committee to which the Governor's recommendation was referred, an attempt was made to "squeeze 'em again," by the substitution of a bill based on the Governor's suggestions. When the bill came up for discussion Representative Bennett of Springfield described it as "Soak 'em legislation," and others joined him in such vigorous opposition that the vote was overwhelmingly in the negative. If was brought out in the course of the debate that automobile owners paid over \$92,000 into the State treasury in the past year, and that the sum will be larger the present year under the present scale of

NEW YORK'S BILL FAILS TO PASS

Suddenly and Unexpectedly Abandoned by Senator Armstrong—Motorists Thereby Saved from Their Friends.

Despite the efforts of the automobilists themselves, that is, those represented by the New York State Automobile Association and Mr. Shattuck's club, the Automobile Club of America, they will not be able to pay \$5 or \$15 per year for the right to use the public roads of New York State, nor will they be able to obtain the distinction of being posted throughout the State as criminals if they are somewhere convicted of violating any of its provisions. They must needs content themselves with having paid \$2 at the time they purchased their cars, whether last year or four years ago. Also, they must be satisfied to carry but one tag on their machines, and when arrested, be content with having the record of arrest made in but the place where the offense was committed. All this is to say that the new automobile bill, fathered by the Association and more or less graciously approved by Mr. Shattuck and Lawver Niles, who thought the size of the fees provided was entirely too small, was abandoned by its sponsor in the senate, Senator Armstrong.

The reasons which prompted Senator Armstrong to withdraw his support at the eleventh hour from the measure which he had introduced in the upper house, are not known. His action in abandoning the bill came as a complete surprise to those who had been concerned in the preparation of it, for it was confidently thought that it would be passed without change or amendment or serious opposition.

One of the results of the Senator's action will be to continue in force the present speed limitations, much to the distress of Shattuck, Niles & Co., and some others who had concluded, after much anxious thought, that unlimited speed was good not alone for them, but for the public at large.

But the bill is dead. The legislature adjourned on Thursday last.

Two Days in Jail for Missing 2.

Over the head of Talbot C. Walker, of San Francisco, a junior in the Sheffield Scientific School, Yale University, there is hanging a sentence of two days in jail at New Haven, Conn. He remains at large pending an appeal of his case. The charge on which he was convicted was that of obscuring the number on his automobile, from which the figure was missing with the result of making the number 405 instead of 4052. In court at New Haven on Monday, 27th inst. Walker pleaded that the missing figure 2 had accidentally fallen off, but evidently the claim was doubted.

This is the

879,512. Internal Combustion Engine. John Braunwalder, Chicago, Ill. Filed May 16, 1906. Serial No. 317,046.

1. In a rotary gas engine, a plurality of rigidly connected pistons, adapted to rotate concentrically about a common axis, in combination with a cylinder mounted upon each piston and means for controlling the radial positions of said cylinders.

879,610. Vehicle Tire. Perry E. Doolittle, Toronto, Ontario, Canada. Filed May 17, 1904. Serial No. 208,368.

1. In combination with a vehicle wheel carrying a collapsible tire, of an auxiliary wheel rim carrying a tire and detachably secured in a lateral position upon the vehicle wheel.

879,726. Gas Engine. Joseph S. Benson, Iowa City, Iowa. Filed Aug. 2, 1907. Serial No. 386.852.

1. In an internal combustion engine, a cylinder, a crank casing, a transfer port for conveying an explosive charge from the crank casing to the cylinder, a rocker valve arranged in said port, a half time shaft, a valve actuating means operable from said shaft and serving to move the valve to open position once during each two revolutions of the crank shaft, and means for disconnecting the operating mechanism and locking said valve in open position to permit operation as a two cycle engine.

879,763. Explosive Motor. Carl R. Gergler. New York; N. Y. Filed May 28, 1907. Serial No. 376.048.

1. In explosive motors, a cylinder and its piston, said cylinder being provided with an exhaust port above the piston when the latter is at the limit of its explosive stroke, and a manually operated valve for closing said exhaust, said valve comprising a siubstantially U-shaped ring, the inner face of the ring being provided with openings adapted to register with the exhaust part of the cylinder.

879,989. Internal Combustion Engine. Herbert G. Underwood, New York, N. Y. Filed Oct. 25, 1905. Serial No. 284,271.

1. In an internal combustion engine of the compression type, the combination of a working cylinder; a piston; a tubular support carried by the cylinder head and projecting into the clearance space, said support being in permanently open communication at two points remote from each other with the interior of the working cylinder; and a gas occluding body located within said supports and adjacent the upper end thereof.

880,195. Tire Attachment. Edward Col-

lins, Ekalaka, Mont. Filed Sept. 13, 1907. Serial No. 392,764.

An attachment for vehicle tires comprising a band encircling the tire, said band being triangular in cross section with its apex notched and outwardly presented, and fastening bolts passing through the band into the tire, said bolts having their heads fitting in the notches in the band, and shaped to extend flush with the apex and the sides of the band.

880,196. Battery. Frank A. Decker, Philadelphia, Pa., assignor, by mesne assignments, to Decker Electrical Manufacturing Company, Wilmington, Del. Filed March 21, 1904. Serial No. 199,304.

1. The combination of a conduit, a socket intersecting said conduit, a tube extending into said socket, and a nut engaging said tube and having a passage therein through which said tube and conduit communicate, substantially as specified.

880,202. Automobile. Allen H. Dingman, De Haven, Pa., assignor of one-half to John Sauers, De Haven, Pa. Filed June 13, 1907. Serial No. 378,842.

1. In a vehicle steering gear, a wheel hub embodying a metallic housing closed at the outer end and open at the inner end, dowel pins carried on the inner face of said closed end, a spindle inclosed by said hub and having a head on its inner end having openings to receive said dowel pins, a screw passed through said closed end into said spindle, a swivel-joint support mounted on said spindle, and provided with diametrically opposed apertured lugs, connecting rods pivotally attached at their outer ends to said lugs, means connected to the inner ends of said connecting rods for operating the same two oppositely disposed and vertically aligned bearing pins carried by said swivel support having bearing sleeves surrounding the same, and an axle bifurcated to form arms at its outer ends, the said arms being secured to said bearing sleeves, and said axle supporting the inner ends of the connecting rods and the operating means therefor.

880,212. Means for Preventing Side Slip of Motor Vehicles. Thomas B. Heathorn, Knightsbridge, London, England. Filed November 11, 1907. Serial No. 401,690.

1. An apparatus for preventing side slip of motor or other road vehicles comprising rollers with helical ribs or projections adapted to engage the surface of the road and means for supporting the rollers in contact with the road surface.

880,257. Shock Absorbing Device for

WANTS AND FOR SALE.

Vehicles. Lewis C. Welch, Oakland, Me. Filed Aug. 9, 1907. Serial No. 387,886.

1. In a shock absorber for vehicles, the combination of a cylinder, a piston therein, by passes extending from one side to the other of the piston and designed to vary the resistance to the passage of liquid as the position of the piston changes and a pneumatic cushioning device associated with the piston for assisting in absorbing the shocks.

880,267. Power Transmission Mechanism. Jonathan U. Baker, Stoutsville, Ohio. Filed July 19, 1907. Serial No. 384,558.

1. In a power transmission device, the combination with a driving shaft, of a driven shaft, a friction disc mounted for rotation upon each side of said shafts, a pair of friction cones mounted to rotate with the driven shaft and adapted to engage said friction discs upon opposite sides thereof, and a friction cone rotating with the driving shaft and adapted to engage and impart rotation to said discs.

880,289. Headlight for Automobiles, etc. William D. Forbes, Morristown, N. J. Filed May 18, 1907. Serial No. 374,418.

1. The combination of a vehicle having steering wheels and a swiveled headlight with a spring tending to turn the headlight in one direction and a flexible connection to the steering wheels in the opposite direction.

880,332. Wheel Rim for Pneumatic Tires. Charles S. Scott, Cadiz, Ohio, assignor to Frank A. Seiberling, Aurora, Ohio. Filed March 19, 1907. Serial No. 363,269.

1. The combination of a vehicle wheel rim having a depressed groove near its detaching edge, an inextensible rim flange sliding over the groove onto the rim, a split locking ring sprung into the groove, and a radial projection rigidly secured to the locking ring engaging a recess in the groove to prevent circumferential motion, substantially as described.

880,367. Battery. Frank A. Decker, Philadelphia, Pa., assignor, by mesne assignments, to Decker Electrical Manufacturing Company, Wilmington, Del. Filed May 9, 1905. Serial No. 259,564.

1. In a battery, a cell having a base, an insulating conduit connected with said base, a plurality of compartments connected to said conduit, electrodes in said compartments, depression in said compartments which receive the bottoms of said electrodes, a conducting device extending through said base in registration with each of said depressions, and a conducting device attached to the exterior of said base in contact with each of said first conducting devices.

880,368. Battery. Frank A. Decker, Philadelphia, Pa., assignor by mesne assignments, to Decker Electrical Manufacturing Company, Wilmington, Del. Filed March 21, 1904. Serial No. 199,303.

1. In an electrochemical apparatus, an electrochemically active part having a honeycombed construction on each side thereof providing a comparatively larger fluid contact surface within comparatively limited borders, substantially as specified.

880,382. Power Transmission Apparatus. Charles R. Keith, Tarrytown, N. Y., assignor of one-half to John William Mason, Tarrytown, N. Y. Filed April 3, 1907. Serial No. 366,171.

1. In a power transmission apparatus,

clutches, bars for shifting said clutches, a controlling lever operable to slide either of said bars, and a spring having a projection rigidly fixed thereto directly engaging the said bars for holding them at the forward and rearward and intermediate positions of their movement.

880,403. Motor Vehicle. James Ritchie, New York, N. Y. Filed May 16, 1907. Serial No. 373,905.

1. In a motor vehicle, a driving shaft provided with a clutch section, a hollow shaft thereon, a clutch section slidable on the hollow shaft for co-operation with the other clutch section, and means for moving said clutch section, comprising an annular flange in connection therewith and having oppositely beveled edges, a bracket slidable transversely of the shaft, and provided on each side of said shaft with an extension, said extension having beveled edges and engaging the opposite beveled edges of the flange, and means for moving the bracket.

880,450. Steering Gear and Axle for Automobiles. Maurice P. Henvis, Norfolk, Va., assignor of one-half to Ephraim Ball, Norfolk, Va. Filed Oct. 11, 1907. Serial No. 396,966.

1. A device of the class described comprising a sleeve adapted to mount the wheels for rotation outside of the hubs and ball bearing means for said sleeve adapted to angularly position said wheels.

880,461. Wind Guard. Henry H. McGiffin and Edward H. McCauley, Pittsburg, Pa., assignors of one-third to James P. Brennan, Braddock, Pa., one-third to W. L. Elford and one-third to said McGiffin, Pittsburg, Pa. Filed Aug. 28, 1907. Serial No. 390,536.

1. In a wind guard, a U-shaped glass frame grooved on its inner face, a grooved bottom bar having sockets for the ends of said frame, an attaching plate, and means for pivoting said bottom bar to the upper edge of said plate.

880,470. Carbid Cartridge. Edwin M. Rosenbluth, Philadelphia, Pa. Original application filed March 9, 1907, Serial No. 361,562. Divided and this application filed Aug. 6, 1907. Serial No. 387,279.

1. In an acetylene gas generator, the combination with a casing; of a carbid chamber; and a removable carbid receptacle having a chamber provided with an enlarged region arranged to prevent the improper insertion of said receptacle in said casing, substantially as set forth.

VICTORY FOR

Bosch Magneto

AT BRIARCLIFF

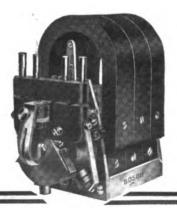

18 out of 22 cars entered in the Briarcliff Race were equipped with the Bosch Magneto. The entire American Crew — 100% — used the Bosch Magneto.

This is an unprecedented demonstration of the wonderful efficiency of this Ignition System. It means that 18 manufacturers and their drivers out of 22 considered it to be the only reliable system obtainable. It means that the Bosch Magneto should be on every automobile whether for city use, touring or racing.

The Bosch Magneto is to be found on the winning car of practically every important racing event the world over, and is part equipment of the Thomas, Zust and Protos Cars in the New York to Paris Race.

BOSCH MAGNETO COMPANY

THE INCOMPARABLE WHITE

THE CAR FOR SERVICE

A TOURING CAR IN THE TRUE SENSE OF THE TERM

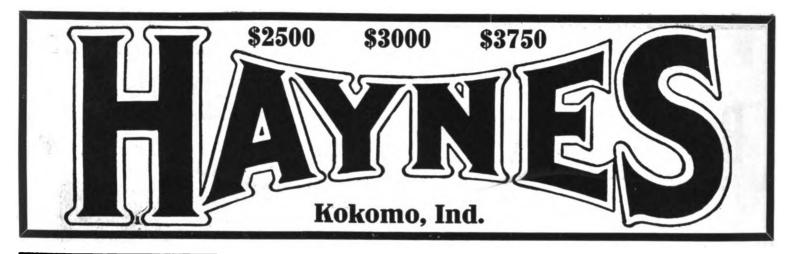

The man who gets the most pleasure from his touring car is not the man who limits his touring to the macadam roads; for the most interesting sections of the country and those of the greatest natural beauty lie, for the most part, beyond the regions of improved highways. For that reason, there is no quality of a motor car more important than the ability to traverse had roads.

In unique degree, the White possesses the qualities of a "bad roads" car. Owing to the perfect flexibility of the engine, the White tourist can accommodate the speed of his car, yard by yard, to the condition of the road, speeding up on each little stretch of good road, and slowing down for each hole and "thank-ye-ma'am"—without shifting of gears or any manipulation except of the throttle. The tremendous pulling power of the White engine under all conditions means immunity from getting stuck in the mud or sand. Running through deep water, as in fording streams, is easy for a White. And as for climbing grades in mountainous regions—there is no other machine which can approach the White in hill-climbing qualities.

Drive a White Steamer and see the country

THE WHITE COMPANY CLEVELAND, OHIO

New York City, Broadway at 62d St. San Francisco, 1750 Market St. Philadelphia, 629-33 N. Broad St. Pittsburg, 138-148 Beatty Street.

Here's a Record Breaker!

DURING the months of January, February, March and April, 1908, one dealer in the middle west sold Rambler automobiles to the value of \$127,325.93.

There is a big opportunity for substantial business men to add greatly to the volume of their business by selling Rambler automobiles.

More business of all kinds is being done in the middle and southwest to-day than in any other section.

Right now Kansas City, perhaps the choicest location of all, is open for the sale of Rambler automobiles.

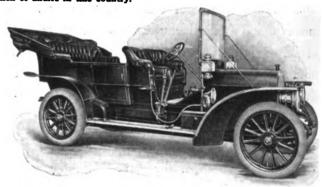

The Rambler sales agency proposition is reciprocal and is bound to interest any wideawake business man.

Write for particulars now.

Maxwell"

Why Don't Dealers Make More Money?

It seems too bad, but it's a fact just the same—and you, Mr. Dealer, and I, might just as well be frank in discussing it—that the Dealer has had to carry the heaviest load and take most of the risks in this business during its period of development; and on the whole he has been a loser.

Few dealers have made money — you know that, and I know it. I deplore it — but facts are stubborn things.

There have been many reasons—incompetence on the dealer's part in many cases—an unsatisfactory product in more; and you have all had dealings with the maker who would not do his part—would not back up his cars when they failed to meet his glowing promises.

But underlying all these is a cause which, until it is eliminated, must always produce the same effect.

The automobile industry will never be on a firm footing until the maker can count, from year to year, decade to decade, on the same sales organization.

This cannot come to pass until some plan of operation—or rather co-operation—has been devised which will insure to the manufacturer the loyalty of every dealer in the field, and to the loyal dealer a share in the proceeds of the manufacturer's success.

Now I believe the sales organization is the key to success in this business. I believe it is the manufacturer's safeguard—the customer's mainstay.

I have given much thought to the solution of this problem. As a net result I have a remedy—to quote our friend from Boston.

No, I'm not going to divulge it here—it isn't for the world, for I'm a selfish man and I've worked this out for the express benefit of the Maxwell factory, Maxwell dealers and Maxwell owners—present and prospective.

That you may thoroughly understand it and be ready to co-operate with me when the right time comes, I am disclosing this plan gradually in our little weekly magazine, the "Co-operator." This journal tells a lot about Maxwell cars as well as my plan for building up a sales force which will eclipse anything of the kind now known either in this or any other manufacturing business. Every line in it will be interesting to you if you are one of those who mean to stay in the industry and profit by the experience of the past.

I want to enlist and then to retain in the Maxwell-Briscoe sales organization all the best, the most energetic, the most enterprising, and the men of highest integrity in the retail department of the automobile business.

I want to perfect a sales organization that will equal our present unrivaled manufacturing facilities.

I've formulated a plan that opens to each of you an opportunity for success that will be limited only by your own ability, energy and enthusiasm.

If you're interested—if you have suffered from the crude, unfair and ruinous methods of the past, write—I will send the "Co-operator" to you for the asking. Write me personally.

A TEST OF PRINCIPLE AND QUALITY

Probably one of the hardest tests an Automobile has ever been put to, has been met by the American entry, A THOMAS FLYER, in the New York to Paris Contest. The front wheels of this car are fitted with Timken Roller Bearings, the hardest service on a car for bearings—but up to the present time has given no trouble or needed any attention.

E. R. THOMAS MOTOR CO., Buffalo:

E. R. THOMAS MOTOR CO., Buffalo:

Gentlemen—It gives me great pleasure to inform you that the TIMKEN ROLLER BEAR-INGS which were used on the Thomas Flyer, which is America's entry in the International Race from New York to Paris, gave no trouble whatsoever from New York to Cheyenne, where I had charge of the car. I also believe that they have given no trouble since. These bearings, as you know, are placed where the greatest strain is on them, and it is a considerable pleasure to inform you that I believe the high quality of workmanship and material in your bearings is such, that they must be able to stand up under any and all road conditions, as the strain placed upon them, and in fact the entire mechanism of the Thomas car in this race was most extraordinary, and probably the hardest strain that could be put upon any motor vehicle, either under ordinary or extraordinary circumstances. The highest praise that I can give your bearings is, that I believe that they are fit component parts for the Thomas Flyer.

Yours very truly,

MONTAGUE ROBERTS.

are made to use on all roads, rough or smooth, and represent a special knowledge of load and tractive requirements, with a wearing quality impossible with any other form of frictionless bearings. And that is why over 60 per cent. of all the high grade American Automobiles and 95 per cent. of the Trucks made in this country recognize The Timken Principle Correct and The Timken Quality Supreme.

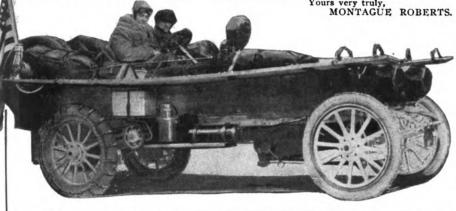

If you are building Automobiles or Trucks we would like to furnish you some data, based on facts that will not only interest you, but save you money.

The Timken Roller Bearing Axle Co.

MORGAN & WRIGHT TIRES

give the same kind of service users are getting everywhere else.

Mr. Joe E. Yowell wrote us under date of April 8th:

"One of the best sets of tires I ever had were Morgan & Wright, and were on a Buick runabout. I used the car for eight months and at the time I sold it two of the tires still had Michigan air in them, and at last account, which was only a short time ago, one of them had never been punctured since leaving the factory July, 1906."

Nearly two years of service without even a puncture is probably due to good luck as well as to good tires, but the character of service received by other users of these tires leads us to believe that "good luck" must be particularly partial to the Morgan & Wright product.

We repeat what we have often stated before, that while we do not claim that every one of our tires will go thru an entire tour or an entire season without trouble, it would surprise most motorists to know what a large percentage of them will do it.

> There is no method of making friends equal to the method of making good.

The Auto-Meter——Is Believed

Every big motor event that has taken place in the past three or four years has seen more Auto-Meters in evidence than all other makes of speed indicators combined.

In the Glidden Tours the number of Auto-Meters used by contestants doubled and tripled all other makes put to-gether.

In the New York-Paris Race the only speed indicator is a Warner on the Thomas car.

Nearly all the automobile manufacturers of the country

use the Warner to test out their cars before they leave the factory.

Two of the most successful makers are including the Warner as part of their regular equipment.

Aren't these facts rather significant—don't they mean anything to you?

Send for our new book, "The Final Truth About Speed Indicators."

Warner Instrument Co.

175 Wheeler Ave., Beloit, Wis

Model 248

A Remarkable Car at a Remarkable Price

In presenting this model we offer a car with all the power, service and appearance of any \$4000 car at less than half that price.

NOTE THE DETAILS

32 h. p. motor, sliding gear transmission with roller bearings throughout, 34-in. wheels with 4-in. tires, floating rear axle, two sets of powerful brakes, both working in the rear wheels, thus relieving the driving mechanism of all braking strain and, if desired, a detachable tonneau body that may be changed to a touring runabout in less than five minutes.

PRICE, with full equipment of lamps, tools, etc., \$1900

KELLOM SUES THE SUBSTITUTORS

Philadelphia Oil Producer Follows up His Detective Work—Seeks \$35,000 Damages from Eight Garages.

Charles F. Kellom & Co., the manufacturers of Invader oil, have made good their threat to bring to book the eight Philadelphia concerns from whom Kellom himself purchased oil which he alleges was fraudulently represented to be of the Invader brand.

Alleging fraud in the substitution of an inferior grade of oil, Kellom & Co. have filed eight separate suits asking for damages aggregating \$35,000. The defendants named are the Mercury Machine Co., 2117 North Broad street; Belmont Auto Station, Belmont avenue and Viola street; Western Garage, 230 South Fortieth street; Springfield Garage, Forty-fifth street and Springfield avenue; North Philadelphia Auto Station, 3425 North Broad street; Rittenhouse Garage, 220 South Twenty-third street; Alexander Allan, Hyland avenue, below Belmont avenue; Suburban Garage, 29 West Harvey street.

Injunction proceedings are directed against the latter concern, and the court is asked to restrain it from selling substituted oil under the Kellom firm's trade name. It is alleged that a big tank, labeled with the name "Invader," is filled with imitation oil, sold as the genuine Kellom product.

Statements of claim in the damage suits are identical, and the names of persons who purchased spurious oils as the Kellom oil are given, backed by chemical analyses to prove the character of the lubricant.

At the time of his "round-up," the Motor World reported how Kellom, accompanied by witnesses, had visited thirteen Philadelphia garages, at eight of which he called for and was supplied with what was represented to be Invader oil, but which proved to be a spurious article. At one place, the

Kellom party struck up such a "cordial acquaintance" with the salesman that he showed them the receptacle from which he laughingly stated that any brand of oil that might be called for was drawn.

Brandt to Conduct Cadillac Branch.

Ernest H. Brandt, former sales manager of the Corbin Motor Vehicle Corporation, has been appointed general eastern manager of the Cadillac Motor Car Co., an appointment that foreshadows the establishment of a direct Cadillac branch in New York City. It shortly will be located at about Fifty-ninth street and Broadway and it will be, of course, Brandt's headquarters. He will have dominion over New England, New York and New Jersey, and the cities of Philadelphia, Baltimore and Washington. In earlier years, Brandt was connected with the Hartford Rubber Works Co., with which E. R. Benson, who just has assumed the sales management of the Cadillac company, also was long identified.

Metzger Quits Cadillac; Benson Succeeds.

W. E. Metzger, so well and so widely known as sales manager of the Cadillac Motor Car Co., Detroit, resigned that office on the 30th ult, and has been succeeded by Ernest R. Benson, who in December last relinquished the secretaryship of the Hartford Rubber Works Co. to join the Cadillac company. Since that time a number of changes have been made in the sales system and these will be further amplified and perfected by Benson. Just what are Metzger's plans for the future have not been made known. He has several proposals under consideration and that he soon will be heard from, his ability and long experience and vigorous personality renders certain.

What Rubay's Schedule Discloses.

Schedules in bankruptcy of Leon Rubay, Inc., the New York accessory importer who failed some two months ago, show liabilities of \$25,186. The assets, amounting to \$19.562, consist of cash, \$586, stock and fixtures, \$5,945, and accounts \$13,031.

FORD FILES AN AUDACIOUS ACTION

Makes Use of Ugly Rumor Affecting A. L. A. M. in Defending Infringement Suit

—Basis of the Rumor.

Ever since it became generally known that pressure from within the Association of Licensed Automobile Manufacturers was seeking to bring about a reduction in the amount of royalty paid under the Selden patent, rumors have been afloat that the organization was in danger of disruption. The rumors have gathered embroidery as they traveled and although probability of disruption is so exceedingly remote as to be almost unthinkable, it did not prevent the attorneys for the Ford Motor Co. from putting the tale to work.

With that audacity which has marked their actions since the Electric Vehicle Co. brought suit against the Ford company for alleged infringement of the Selden patent, the attorneys on Tuesday last filed an application in the United States Circuit Court for the Southern District of New York, asking that the Electric Vehicle Co. be required to give security for costs in its suits for Selden patent infringement against the Ford company and others, failing which, they pray that the suits be dismissed. It is cited that the Electric Vehicle Co. is the sole owner of the Selden patent, that that company is in the hands of receivers and that the control of the litigation is under the authority of the A. L. A. M., which heretofore has been paying the expenses thereof and is under obligation to pay such expenses. The rumor affecting the future of the association and which alleges that it is in a "bad way" generally, is made use of in the concluding clause of the application, as follows:

"That said licensed association appears to be on the verge of dissolution and its individual members likely to be involved in costly litigation; that its revenues are very much impaired, and that as a source from which costs may be paid, it has become wholly unreliable."

While this manner of getting a disquieting rumor before the public has caused a conflict of opinion ranging from expressed admiration to unmeasured condemnation, it is safe to say that few persons accept the Ford application seriously or believe that the courts will give it more than compulsory attention.

As a matter of fact, the two members of the A. L. A. M. who led the fight for reduced royalty have within the last week voiced the most loyal sentiments, one of them giving it as his opinion that even without the Selden patent as a rallying standard, the disruption of the association would be in the nature of a calamity to the industry, so useful has it proved. The other, H. H. Franklin, has not only voiced practically similar opinions, but has given proof of his loyalty by cancelling his contract with an Ohio agent who violated the A. L. A. M. "exclusive agency" agreement by handling an unlicensed car. Also as a matter of fact, the membership agreement of the association is of a very binding nature as the Ford attorneys discovered when they took up or stood behind the Searchmont case in an endeavor to secure a share of the A. L. A. M. surplus.

Selden Royalty Case is Continued.

The hearing on the application of receivers of the Electric Vehicle Co. for permission to reduce the amount of royalty now exacted from holders of licenses under the Selden patent, has been continued until May 18th. Counsel for all of the interests concerned were present in the United States Court in Trenton, N. J., on Monday last, the date originally set for the hearing, and the argument presented was such that the court would not render an immediate decision.

The only objector to the granting of the petition was Frank A. Harrigan, of Philadelphia, who represented one of the creditors of the Electric Vehicle Co., arguing that these royalties had all been collected in the past, and gave statistics to show that in no year since 1903 had their aggregate fallen as low as the newly stipulated maximum. In 1903, they amounted to \$153,783.55; in 1904, \$253,273.42; in 1905, \$413,958.31; in 1906, \$564,535.24, and in the first nine months of 1907, \$508,058.31. He pointed out that the granting of the petitions would, therefore, result in loss to the creditors of the Electric Vehicle Co., and asked that it be dismissed. In this he was opposed not only by the receivers' attorneys, but by the former United States Attorney-General John W. Griggs, who appeared in behalf of the Association of Licensed Automobile Manufacturers.

After a lengthy hearing of argument, Judge Lanning decided that the interests were of such magnitude that further consideration was necessary, and postponed further action until May 18.

THE MOTOR WORLD

The Week's Incorporations.

Kewaunee, Wis.—Marvel Motor Works, under Wisconsin laws, with \$30,000 capital. Corporators—John Dishmaker and others.

Kansas City, Mo.—Fletcher-Cowherd Automobile Co., of Kansas City, The, under Missouri laws; capital increased from \$10,000 to \$16,000.

Seattle, Wash.—White Motor Car Co., under Washington laws, with \$50,000 capital. Corporators—C. B. White, John Clifford, P. S. Donaldson.

Chicago, Ill.—Maxwell-Briscoè Co., under Illinois laws, with \$30,000 capital, to sell automobiles. Corporators—Joseph M. Austin, Clarence E. Adams, S. C. Austin.

Ashland, Ky.—Ashland Automobile Co., Boyd County, under Kentucky laws, with \$3,000 capital. Corporators—Henry J. Seibert, Charles W. Hutchinson, Bessie Hutchinson.

Omaha, Neb.—Pacific Coast Mobile Car Sign Co., under Nebraska laws, with \$100,-000 capital. Corporators—L. B. Kinne, Dr. N. J. Rice, Theodore Kharas, J. C. Baker, C. G. Saunders.

Chicago, Ill.—Hansen-Busch Automobile Co., under Illinois laws, with \$5,000 capital; manufacturing and dealing in automobiles and operating machine shop. Corporators—John T. Gilbert, A. Hansen, H. Busch.

Glens Falls, N. Y.—Glens Falls Automobile Co., under New York laws, with \$20,000 capital; to manufacture and sell automobiles. Corporators—W. Irving Griffing, Edward F. Irish, Winifred S. Harris, Glens Falls, N. Y.

Hartford, Conn.—Bush Mfg. Co., The, under Connecticut laws, with \$2,500 capital; to manufacture, buy, sell and deal in automobiles and automobile parts. Corporators—Philip M. Bush, Edward J. Jetter, Bernard Garner.

Lynbrook, L. I.—Walton Motor Co., under New York laws, with \$10,000 capital. Corporators—Julian N. Walton. Lynbrook, L. I.; Elbridge N. Smith, 412 Clermont avenue, Brooklyn, N. Y.; George F. Hickey, 69 Wall street. New York City, N. Y.

Grand Rapids, Mich.—Anthony-Hatcher Co., The, under Michigan laws, with \$20,000 capital; to manufacture automobiles, trucks, and parts, general michinery and tools. Corporators—George E. Anthony, William A. Hatcher, George Clapperton, Charles M. Owen.

New York City, N. Y.—Haynes Automobile Co., under New York laws, with \$5,000 capital. Corporators—Ernest W. Headington, 325 West Forty-fifth street, and Walter Broadhead, 3440 Broadway, New York City, N. Y.; James R. Finucane, 148 Washington avenue, Brooklyn, N. Y.

In the Retail World.

S. S. Pierce, a young business man from Boston, has succeeded the Western Automobile and Supply Co. at Colorado Springs, Colo. Studebaker cars are to be handled in Colorado Springs, Colo., by Sanderson & Reinken, who have secured the agency. They will handle both gasolene and electric vehicles.

The Johnson Carriage Co. are this week opening a two-story fireproof garage in New Canaan, Conn. They will handle the Maxwell cars and do a general repair and garage business.

Bruce & Co., Memphis, Tenn., have obtained a permit to erect a garage at 340 Monroe avenue. The building, to cost \$10,-900, will be a one-story brick structure, 86 feet wide and extending back 144 feet.

Albert L. Perkins, dealing in automobiles at 1437 North Second street, St. Louis, Mo., has applied to the United States District Court to be adjudged a bankrupt. His liabilities are \$29,725.73, and his assets \$14,057

Frederick 'Phillips, a civil engineer of Utica, N. Y., who is superintending a big engineering job in Florida, has gone into the automobile business "on the side." He has taken the Franklin agency and plans to erect a garage in Jacksonville.

The Bland-Mueller Auto Co., Milwaukee, Wis., has taken possession of the quarters formerly occupied by the Solliday Motor Car Co., at Fourth and Prairie streets. They will do renting, tire repairing and general garage work.

Fire at Golden Gate avenue and Larkin street, San Francisco, Cal., on the 25th ult., burned out the establishments of the Prest-O-Lite Co., the Neustadt Auto Supply Co., the C. F. Splitdorf Co., the San Francisco Auto Repair Co., and D. Zelinsky, automobile painter.

The Star Motor Co., 226 Halsey street, Newark, N. J., has been adjudged insolvent and Vice-Chancellor Emery has appointed W. Eugene Turton, a local lawyer, as receiver, fixing his bond at \$5,000. The assets of the company were given as \$3.300, and the liabilities as aggregating \$14,000.

The property of the Brockton Motor Exchange, Brockton, Mass., has been bought by a new concern named the Gay Automobile Co., incorporated with a capitalization of \$10,000. The company will continue the general automobile business at the same location, 351 Belmont avenue.

Aitken to Design the Mors Wagons.

The St. Louis Car Co., makers of the American Mors, are making ready to bring out commercial vehicles. W. J. Aitken, who has had experience as designing engineer with several automobile concerns, has been engaged to further the work.

Prest-O-Lite Sues Post & Lester.

A bill of complaint has been filed in the United States Circuit Court for the Connecticut district, by the Prest-O-Lite Co. of Indianapolis against the Post & Lester Co. of Hartford. The complainant alleges infringement of trade mark.

MARCH EXPORTS SHRINK SLIGHTLY

Gains in Some Geographical Divisions Offset in Others—Shipments of Parts Show Marked Gains.

March proved to be a month of ups and downs in the export field. Yet despite gains on the part of 9 of the geographical divisions into which the foreign market is segregated by the Bureau of Statistics at Washington, the losses of the remaining 5 were sufficient to cause a net loss to the industry of some \$6,000, as compared with the results of the March trading in 1907. But 217 cars were exported during the month, as against 307 one year ago. Their combined values were \$466,447 and \$493,425, respectively. The valuation of parts exported, however, revealed a gain of something over \$21,000.

Of the countries showing improved conditions, West Indies and Bermuda led with \$20,226, while Italy, France and "Other Countries" followed in the order named with \$18,800, \$15,300 and \$13,000, respectively and in round numbers. Depreciating returns are credited to "Other Europe," which has fallen away nearly \$55,000, Mexico, with about \$27,500 loss, South America, British East Indies and Germany.

For the nine months ending March 31st a total gain of \$182,618 is revealed. Eight countries shared in the upward trend, the United Kingdom leading with no less than a \$373,780 appreciation. France, West Indies and Bermuda, Italy and "Other Countries" followed in this order and in amounts ranging from \$116,260 in the first instance, to \$24,860 in the last. Of the five countries showing losses as compared with the corresponding period of one year ago, Mexico lead with some \$301,100, while "Other Europe," British North America and British Australasia followed with approximately \$63,000, \$46,000 and \$43,000 losses. The losses of the British East Indies and Africa were small. The report in detail follows:

	←Ma	rch—	Nine Months Ending March

Dickinson's Verdict Proves Valueless.

Despite the jury verdict which gave him the full amount he sued for, \$16,000, and \$3,000 interest, Fred S. Dickinson appears to be as far as ever from securing the money from the Matheson Motor Car Co., Wilkes Barre, Pa. Dickinson claimed that he was instrumental in selling to the Matheson company the inventions of Charles R. Greuter for which he was promised certain returns, and after a long trial the jury sustained his claim. Judge Archbald, sitting in the United States Court at Scranton, Pa., has, however, overruled the verdict, and Dickinson probably will ask for a new trial.

During the hearing it was claimed by the plaintiff that the defendant company was estopped from denying its responsibility of the agreement entered into by the plaintiff and Greuter. Judge Archbald, in his opinion, fails to coincide with this view, and says, in part: "All that the plaintiff can claim to have contributed is his service, which was not rendered to the company, but solely for himself and Greuter. Greuter as sole owner of the invention was at perfect liberty to dispose of it to any company he desired and the company owed no duty to Dickinson except as a matter of courtesy. Judgment is rendered for the defendant non obstante veredicto."

Imports Continue to Diminish.

Despite the heavy receipt of taximeter cabs, which has served to give the importing trade an appearance of health, the statistics indicate that there has been no interruption in the shrinkage of the American demand for foreign cars. During April. but 71 automobiles, of the total appraised value of \$181,496.75, were brought over, in comparison with 108 cars, valued at \$348,835.09 in April, 1907, and 152 cars, valued at \$508.083.57 in April, 1906. Three hundred and thirty-four cars, valued at \$763,393.78, have been imported at this port since January 1, compared with 384 cars, valued at \$1,261,296.59, and 452 cars, valued at \$1,467,862.15, in the same period of 1907 and 1906, respectively.

BANKER ALLEGES A CONSPIRACY

Former Chicago Dealer Sues to Recover
Damages for Lost Business—Tells
How He was "Sold Out."

Having stepped into the limelight again after a long period of retirement from public view, Albert C. Banker, of Chicago, manifests a disposition to hold the stage. He jumped to the center a few weeks ago, as narrated in the Motor World at the time, through the action of a Chicago court resulting from his alleged threat to shoot Nicholas E. Ford, who had foreclosed a mortgage on his automobile business. It developed in the proceedings that his "shooting iron" was very much out of commission and could not be fired.

Now Banker is getting back at Ford; and others are involved. Banker, on Saturday, 2d inst., filed a suit in the Municipal Court, with a bill of particulars, wherein charges of conspiracy to defraud him of his automobile business are made against his former attorney, J. Marion Miller, together with George A. Durant, Banker's former superintendent; Nicholas E. Ford, who is a broker, and William H. Gardner. The suit is for damages in the amount of \$15,000.

Banker formerly had an automobile establishment on Michigan avenue and in December, 1907, he says, Gardner's attorney, Miller, induced him to execute to Miller a promisory note for \$1,000 and a mortgage on the plant. These obligations, according to Banker, were to secure to Miller the payment of future attorney's fees. Later, according to Banker, Durant was made custodian of the note and the mortgage, and Ford, representing that he was assignee. owner and holder of the note and the mortgage, seized the property and on April 6, Banker charges a "pretended sale was made without legal notice thereof, and the only bidders were George A. Durant and William H. Gardner.'

Metzger Succeeds Gunderson in N. A. A. M.

At the monthly meeting of the National Association of Automobile Manufacturers in New York yesterday, W. E. Metzger resigned as the representative of the Cadillac Motor Car Co., and V. M. Gunderson as representative of the Northern Motor Car Co. Gunderson was immediately succeeded by Metzger, who long has had an interest in the Northern company, with which, it has been common report, he shortly will become prominently identified, a report that appears well founded in view of yesterday's proceedings. At the same meeting E. R. Chapin resigned as representative of the E. R. Thomas Buffalo company and H. E. Coffin as representative of the E. R. Thomas Detroit company, Chapin being at once elected to fill the vacancy caused by Coffin's retirement.

Automobiles

A "six" needn't be expensive to own.

You can carry seven passengers in the Franklin 6-cylinder Type H automobile cheaper than you can carry five in the average 5-passenger machine.

Type H weighs only 2,600 pounds. And the air-cooled engine does the same work on 25 per cent. less gasoline than a water-cooled motor.

The average 7-passenger machine weighs a thousand pounds more than Type II. That means over 40 per cent more gasoline and tires to pay for. And not an ounce more touring ability.

You can't use the power of a heavy automobile on average roads. You can't "let it out" comfortably and safely.

What big, heavy water-cooled machine could run from San Francisco to New York in 15 days, as the Type H did two years ago; or from Chicago to New York in less than 40 hours as the Franklin D did last summer with the same size cylinders as Type H and the same shock-resisting Franklin construction? Many automobiles have tried it. None but the Franklin ever did it.

Type H doesn't pound on the roads like a heavy automobile. It is strong and easy to manage—less liable to accident. It lasts longer. That brings the owning cost down.

The Franklin has no water-cooling system; nothing to boil nor leak nor freeze nor fuss over. Type II solves the problem of high-power, light-weight, and a well-balanced motor. It is the present limit of 6-cylinder engineering. No other high-powered automobile rides so easy or is so smooth and flexible. No other carries its load so far in a day on American roads. Think of a big 6-cylinder 7-passenger automobile that costs less to own and run than the average 5-passenger 4-cylinder machine.

Weight makes owning-cost. See your automobile weighed.

Positions of the Pedals.

Motorists of long standing often find it difficult to appreciate the mental attitude of the novice, and even to comprehend how it is possible for confusion to result from an attempt to control successfully so simple a mechanism as the motor car. Even when not at all well acquainted with the details of the power plant, it is still hard to realize that the control mechanism presents untold perplexities to the beginner. This lack of sympathy between those who possess and those who are without experience in handling machines, tends to act as a check upon simplification in certain details, merely because the makers find it hard to appreciate the need of refinements which are, to their own way of thinking, uncalled for.

It has come to be pretty generally recognized, for example, that the accelerator pedal is a useful accessory to the controlling

system. In modern cars, it is most commonly use in conjunction with a hand lever mounted on the steering wheel, and furnishes a convenient method of suddenly increasing or reducing the speed of the engine, when changing gears, or when cramped in traffic. It would be extremely difficult to convince the average maker of a car so equipped, however, that there is the remotest possibility that the accelerator pedal and the brake pedal which lies adjacent to it might become confused in an emergency, and with disastrous results. With the driver of experience such a mistake is practically impossible because the use of the respective pedals, as well as their exact location on the foot board is so firmly impressed on the mind that the effort of applying them is wholly sub-conscious. As the uses of the two are distinctly opposite in purpose, the chance of their becoming confused is still further removed.

Nevertheless, the fact remains that beginners are frequently known to perform most extraordinary evolutions through this circumstance, and that numerous accidents are avoided only because a kindly Fate which always watches over the toddler intervenes to prevent. On this account such arrangements of the control as permit the accelerator to be placed at some distance from the brake pedal, or require a different movement for operating the one from that which is required for the other, may be considered advantageous. Where pedals of the "push" type are used for the clutch and brake, and of the piano type for the accelerator, the advantage is considerable, as is also the case where the accelerator pedal or button is located at the extreme end of the board.

What would serve the purpose to better advantage, perhaps, would be some automatic interlocking arrangement, whereby the functions of brake and accelerator pedal could be combined, with opposite motions required to effect the two different purposes. Somewhat the same idea is carried out where the clutch pedal is interconnected with the throttle. This arrangement has its disadvantages, however, since with anything like a close adjustment, it is impossible to speed the motor before engaging the transmission. With the brake, no such difficulty exists. The possible objection on the score of the occasional requirement of starting from rest without fully releasing the brake is now eliminated by the fairly general adoption of the ratchet

sprag, or "hill-pawit" "Fool-proofing" the car. is an odious catch phrase which has itself a foolish sound in the ears of the accomplished motorist. But, when it is considered that not every driver can be expected to be an expert or a mechanic, the wisdom of the practice is perfectly apparent. 1

Repairers, Expert and Otherwise.

He is a wise automobilist who knows his own repairman. Probably there is no riskier experiment, or one more replete with possibilities for annoyance, than to seek the counsel and assistance of a mechanic or half mechanic, whose only guarantee of ability to repair the power plant of an automobile is found in his own statement, printed on his business cards or heralded by his companions, that he is a "Gas Engine Expert."

Dr. Johnson says: "Knowledge is of two kinds: we know a subject ourselves, or we know where we can find information upon it," and the latter is as important as the former. To accept the statement of a selfstyled expert that he is entirely competent to remedy the difficulties which have presented themselves, without evidence that his experiences in the past warrant the assertion, is merely an instance of "buying a pig in a poke" and as most of the employes in garages and repair shops proclaim their right to the title "expert," it is more than an even chance that the customer will suffer as often as he will benefit by the experiment.

One of the common practices of the present day is for owners to engage the services of shop employes and garage attendants to do work evenings and Sundays, when they are not engaged in their regular occupations. Of course the object is to get "cheap" repairs by cutting out the garage owner's profit. But this plan does not always work well, as it does not follow that the employes who can temper springs or turn up a set of piston rings, is competent to find the trouble in a motor and remedy it. There is no reason why a machinist should be expected to understand the timing of a motor or the adjustment of some of its minor parts, and actually he does not understand it, unless he has had the opportunity to do these things often, thus learning by actual experience, which, positively, is the only way that he can learn.

Because a man is familiar with the uses of machinery and can run a lathe or drill

press he is not necessarily competent to advise in matters relating to automobiles. An owner will do far better to pay the cost of having his car repaired in a proper place and in the regular way then he will by engaging the "off" time of some irresponsible machinist who may be able to "bluff" through a job of repair or adjustment, which he actually does not understand.

It seems as though every time Tom, Dick and Harry who works in a garage or repair shop, whether as body washer or clerk, soon styles himself as some sort of a mysterious wizard who can diagnose the symptoms in gasolene engine troubles and make complete repairs with one hand tied behind him and both eyes shut. But let this type of individual get at your engine and you'll bring joy to the reputable repairman to whom eventually you will be forced to go.

If there is any one thing more than half a dozen others that owners want to flee from, as they would from the plague, its the "gas engine expert" or any other self styled "expert" who, in point of fact, too often does not know as much about the automobile as does the man who paid for it and has had, at least, a little experience in its care and operation.

Mr. Hower and His Run.

Chairman Hower's press bureau is making a manful effort to prove itself worthy of its hire. It has delivered a "crusher," which is to say, that it has answered the Motor World's query: What will happen to the Glidden contest if anything happens to Hower? The press bureau answers the question easily—poof! just like that! "The tour will go right on." And of course it will. But not "according to Hower." That is impossible, and there is no other way that it rightfully can go on if the rules mean what they say.

The rules state unequivocally that no one but Mr. Hower shall have anything whatsoever to say or do with the contest at any time. The press bureau maintains that if that gentleman should be disabled by a stomach ache or anything else, his secretary will fall heir to his duties and to his previously unheard of power—the power to reject anyone or anything, or to change or repeal any rule, or to make new ones, or to alter any score and keep on doing it "up to and including the final award."

The press bureau is inclined to scold any one who disagrees with its telepathic interpretation of the English language. It thinks it is "real mean" that any one should resort to "quibbles" or "technicalities." But when a small army of tradespeople are engaged in a bitter scramble for a sky-scraping advertisment—which is the real definition of the Glidden contest—technicalities are likely to play a very important part; and he is a wise promoter who recognizes the truth far in advance.

According to the rules as they have been laid down, no contestant in the Glidden business need, or indeed should pay the slightest attention to anything that may be said by assistant chairmen, or first, second or third assistant secretaries, or even press agents. They can laugh at each and all of them. There is but one person to whom they should and must give heed-the chairman, Mr. Frank B. Hower, an estimable gentleman with unusual ideas of sport. There is no room for quibble on this point. The rules are specific. They provide for one official and one only-the chairman; no one else has any authority of any kind and no provision is made for a shifting of any part of his power or for a substitute or successor in the event of his disablement. His secretary may have a "rainy day schedule" and other things concealed in his brain, but what of it? If Mr. Hower is not there to drag them from concealment and make a new rule or change an old one on the spot the secretary certainly has no power to do so, and the competitor who heeded him merely would be "taking chances."

The fact of the matter is that Mr. Hower either is consumed by his own egotism or has been badly advised. The manufacturer who pays \$200 for the privilege of seeking an advertisement in such a "blind run," the rules for which mean nothing, and which absolutely is subject to the irritations and caprices of one man, must want advertisement pretty badly. Mr. Hower undoubtedly is a gentleman and an honorable one, but for all of that, he is but human. Rules and laws are made to be inflexible for a purpose. No judge can be fair to all who is a law unto himself, and who may have one rule to-day and another one to-morrow. That is the sort of judgment on which the Glidden contest places a premium, paid press agents to the contrary notwithstand-

When a manufacturer has acquired a proud reputation for his product no effort or expense is too great to protect it. For that reason, the oil manufacturer who has brought to book men who palmed off on

COMING EVENTS

May 15, Algonquin, Ill.—Chicago Motor Club's annual hill climbs on Perry and Phillips hills.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 20, Indianapolis, Ind.—Indianapolis Automobile Trade Association's 160 miles sealed bonnet endurance run.

May 23, Albany, N. Y.—Albany Automobile Club's annual hill climbing contest up Menand's hill.

May 30, Salem, N. J.—Salem Horse Show and Athletic Association's track meet.

Map 30, Denver, Colo.—300-miles road race for stock chassis.

May 30, Boston, Mass. Bay State Automobile Association's race meet at Readville track,

May 30, Scranton, Pa.—Scranton Automobile Club's hill climbing contest on Scrub Oak mountain road.

May 30, Newark, N. J.—New Jersey Automobile and Motor Club's 12-hours endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's third annual hill climbing contest up Giant's Despair.

May 30, Baltimore, Md.—Motor Car Racing Association's race meet at Pimlico track.

May 30, Cleveland, Ohio—Cleveland Automobile Club's second annual hill climbing contest.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

June 5, Jamaica, N. Y.—Long Island Subway Celebration Committee's one mile record trials on Hillside avenue.

June 6, Williamsport, Pa.—Williamsport Automobile Club's hill climbing contest.

June 24, 25, 26 and 27, Chicago, Ill.—Chicago Motor Club's 1.200 miles reliability run to Dixon, South Bend, Joliet and Chicago.

July 9, Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

unsuspecting purchasers a spurious lubricant, merits whole hearted commendation; his example is worthy of emulation. The just-as-good argument is bad enough, but it is not in the same class with barefaced substitution.

SMALL TROUBLES SPOILED SCORES

Only Two Perfect in Harrisburg's Sealed Bonnet Run-Ditching of One Car the Only Disaster.

Every one agrees that it was a great sealed bonnet endurance run-was the two days' contest promoted by the Automobile Club of Harrisburg, Pa., the route of which was from that city to Philadelphia and rethe class. The Rambler and the Pennsylvania also were perfect in this class until the technical committee got in its work. Then the Rambler lost 17 points and the Pennsylvania was assessed 11 points, both penalizations being for loosened parts, it was stated. The only other car that suffered in this manner in the final reckoning was the Thomas in Class A, driven by C. C. Fairman. It was assessed 15 points.

Why many of the cars did not finish with perfect scores may be told in a few words.

HODSON (STODDARD-DAYTON) DITCHED NEAR EASTON

turn, Monday and Tuesday, May 5th and 6th. Unlike a majority of runs of the sort there were not a dozen or more perfect scores at the finish. True, of the 26 cars that left Harrisburg on Monday, there were six that got back to the Pennsylvania capital Tuesday night with apparently perfect scores, but when the technical committee got through its task of examining the mechanism of the perfect six, four were dropped from the list. Whereat there was considerable sorrow. There were just two cars that withstood every test, and were adjudged perfect scorers in every sense of the word. They were Walter C. White's White, winner of Class A, for touring cars costing \$2,250 and over, and C. C. Cumbler's Pullman, winner of Class D, for runabouts costing less than \$2,000. However, the winner in Class B, for touring cars costing less than \$2,250, was two winks within a perfect score. It was W. W. Cram's Mitchell, and after finishing with perfect scores as regards time schedule and without any mechanical trouble, the committee in the final examination discovered a small water leak and a nut lock on the exhaust manifold missing. That cost just two points. In like manner was Stuart Lafean's Pullman penalized in Class C, for runabouts costing \$2,000 and over. It finished with a perfect score, but in the final examination the committee found it six points off technically, not enough, however, to lose first place in

gine trouble. Robert Shirk, Stoddard-Davton ,lost 150 points through carburetter trouble, while the other Stoddard-Dayton, driven by Howard Hodson, was put out at Easton with a broken wheel, being forced into a ditch by another car. F. F. Mears, Atlas, had continuous tire trouble, and A. D. Miller, Elmore, was disqualified after the first day's run. Engine trouble is said to have been responsible for the downfall of C. J. Swain, Apperson, while Arthur Kumpf, who finished last year's Glidden tour with a perfect score, broke the differentials in his car. A. A. Jones, Ford, damaged a coil unit which lost for him many points from both time and mechanical standpoints.

There were 26 cars that left Harrisburg early Monday morning for the 174.5 miles run to Philadelphia, via Lebanon, Reading, Allentown, Easton and Doylestown. The time limit to Lebanon, 26.4 miles, was 1 hour 20 minutes, and to Reading, 29.8 miles. 1 hour 30 minutes. One hour 50 minutes was allowed for the 37 miles run to Allentown and 1 hour 10 minutes to Easton, 23 miles. From Easton to Doylestown is 32.4 miles and the schedule was 1 hour 35 minutes, ten minutes less than this being allowed for the final leg of the first day's run into Philadelphia, 26.1 miles.

The roads over which the route was laid were in far better condition than had been expected after the rains of the week before. The worst trouble was dust, although con-

CROWD OF SPECTATORS AT READING-A TYPICAL GATHERING

R. H. Hagerling, Cadillac, had tire trouble, which lost 203 points, and jammed his gears, which cost him a further loss of 439 points. Chester Smith, Jackson, broke a tire bead and lost 15 points, while E. G. Irvin's Pullman suffered with a broken water connection. Robert Morton's Pullman had engine trouble the first day and Graupner, a running mate of Irvin and Morton, lost points through the same cause.

Conklin's Pullman had both tire and en-

siderable tire trouble was experienced on account of sharp loose stones. The water breaks in the vicinity of Reiglesville and Doylestown also caused several minor mechanical troubles. The only accident of the day was caused indirectly through tire trouble. Howard Hodson, Stoddard-Dayton, was forced into a ditch between Kutztown and Allentown when trying to pass C. C. Fairman's Thomas car. The latter had been delayed by tire trouble and a signal had

been given to Hodson to pass. As he was about to do so, the Thomas veered with the above result. With the aid of passengers in Charles Fleming's Maxwell the car was pulled out of the water and was making fine time on the way to Dolyestown, when the right front wheel, which had been weakened by the dive into the ditch, gave way and dropped the axle down on the ground. No one was thrown out or injured in any way.

It was a dirty-faced crowd that reached Philadelphia and drove to the White garage where the cars were locked under official surveillance during the night. Despite their dirty faces, eleven of the drivers were happy for it was supposed they had perfect scores for that half of the journey. The clean score drivers were: J. S. Tregon, Jackson; E. G. Irvin, Pullman; J. A. Kline, Pullman; Stuart Lafean, Pullman; H. W. Rawll, Pierce Arrow; W. M. Cram, Mitchell; S. Thorley, Cadillac; A. A. Jones, Ford; A. H. Bitner, Rambler; Len Zengle, Pennsylvania, and last, but not least by any means, Walter C. White, White.

The return trip from Philadelphia to Harrisburg, on Tuesday, via Norristown, Reading, Lancaster and Mount Joy, a distance of 142.7 miles, resulted in a tumble from the perfect score brigade by several others. The run back to Harrisburg was marked by one casualty. It was the unfortunate knocking down and injuring of James L. Douglass, a prominent citizen of Reading, by Chester A. Smith, in a Jackson car. The accident was not the fault of the driver, as has been stated, but was caused by the inadequacy of the police regulations, according to an eyewitness of the unfortunate affair. When the cars began to arrive at the control in Reading there was but one policeman to handle a crowd of 250 persons. Smith already had stopped his car near the control and when the time came for him to check in he started ahead and the crowd parted, leaving the

old man standing alone with his back to the approaching car. He did not get out of the way in time and the car hit him and knocked him down. At this point the officious policeman jumped on the running board of the Jackson car, grabbed Smith by the neck and in spite of the fact that the car was still moving, attempted to drag him from the seat. Accompanied by a cry of "lynch him" from the mob. Smith was yanked from the seat and dragged off to the police station, still held by the back of the neck and surrounded by a hooting crowd. The totally uncalled for rough manner in which the policeman handled Smith gave the impression that the brave (?) Reading officer had captured a desperado, which is probably what he wanted the crowd to think.

This left the remaining crowd at the control to wander around with no police in sight. R. H. Hagerling, Cadillac, drove up just as the old man, Douglass, was knocked down, and Hagerling was arrested, too, although he was not concerned in the accident. Although Smith ran only 25 yards, he was charged with running 20 miles an hour, and Hagerling's name was entered in the blotter with the same offense. Each driver was fined \$25, which was paid by W. I. Dill, who entered the Cadillac car. After the fines were paid both drivers were re-arrested-Smith on a charge of violating the speed regulations of the county and with aggravated assault and battery, and Hagerling for having violated the speed regulations. Bail was given as the magistrate would not listen to the argument that the drivers could not be arrested twice for the same offense, after the fine had been paid once. It is doubtful if Douglass will recover. His left arm was broken near the shoulder, and his left hip was injured.. It is feared that he may have suffered internal injuries, and as he is 81 years old, it is feared that his age may count against his recovery. At last reports he was but slightly improved.

Walter White's driving excited admiration. He was always the last to start and always the last to check in on time at the controls, and in consequence his party was the only one not covered with dust. White always had just time enough at the controls to get out and look over the car. His victory was a double one, as he was one of the four drivers that tied for the trophy last year. The others who were in the tie were A. G. Irvin, Pullman; S. K. Hamburger, Thomas, and H. F. Rawll, Pierce Arrow. As Hamburger could not get the same car he had last year he did not compete in the runoff. Why the other did not get perfect scores has been told. White thereby gains permanent possession of the 1907 trophy.

Subjoined is the complete score as given out by the contest committee. The first two colmns of figures give the penalties for the lateness at controls each day; the second two columns show the points scored for work on motors, breaking of seals, or stopping of motors involuntarily. The fifth column gives the penalties imposed by the technical committee in its final investigation after the finish at Harrisburg. Loose bolts, nuts, broken parts and other disarrangements were penalized.

Virginia State Association Joins A. A. A.

The Virginia State Automobile Association was elected to membership in the American Automobile Association at the meeting of the latter organization, held in New York City, Tuesday afternoon, 5th inst. The acquisition of this association makes the total State memberships of the national body number twenty-four. The Automobile Club of Little Rock, Ark., was elected as a club. Frank Joyce, president of the Minnesota State Automobile Association, recommended that the association adopt an emblem for members to use on the radiators of their cars. It is likely that his suggestion will receive further consideration.. It was stated that several attractive touring propositions were submitted, but the nature of them was not divulged. The nomination of Powell Evans, president of the Automobile Club of Philadelphia, as a member of the executive committee of the Good Roads Board was confirmed.

No More New York Legislation This Year.

Despite printed statements that during the special session of the New York legislature, which will convene on the 11th inst. action will be taken on the new automobile bill that was abandoned by Senator Armstrong, in the last house of the regular session, there is no truth in the reports. Chairman Terry, of the legislative committee of the American Automobile Association states that as the special session was called solely to consider the race track bills, automobile legislation is out of the question.

THIRTEEN WAS THE LUCKY NUMBER

That Many Perfect Scores Made in Detroit's Three Days' Run—All Sorts of Roads Encountered.

With 32 starters, all but two of which finished, and 13 of that number with perfect scores, the three days endurance run conducted by the Detroit Automobile Dealers' Association on April 29, 30 and May 1, over 435 miles of variable roads was a success—such a success that it cannot be compared with the endurance run held last year. The outcome of the three days' run was so favorable that the dealers talk of holding a non-stop endurance run over somewhat the same course later in the season.

Because thirteen of the competing drivers finished without a mark against them the association decided to not split hairs in an effort to award the cup, but instead will engrave the names of the thirteen on the trophy and hold it for future competition. The perfect scorers were Davis (Franklin), Grant (Thomas), E. J. Chapman (Northern), Kelsey (Maxwell), Mochesky (Thomas), H. K. Sheridan (White), House (Northern), Day (Pierce-Arrow), Aubel (Oldsmobile), Lane (Stoddard-Dayton), Lorimer (Thomas), F. E. Crum (Oldsmobile), and Bemb (Peerless).

Starting at 6.30 a. m. Wednesday, 29th ult., 32 cars left the Hotel Tuller in Detroit, at intervals of two minutes, for the first day's run to Saginaw, 140 miles. All kinds of roads were encountered, those between Saginaw and Bay City being so bad that several of the cars lost points. In many places the mud was more than hub deep and it is a wonder that more scores did not sink when the cars did. One of the Brush runabouts came to grief near Lapeer, just before reaching the noon control at Flint. The conditions of the run were not exacting. The cars were all competing as one class, the only requirements being that the runabouts had to carry at least two persons and the touring cars at least three persons. The time allowance was made on a basis of 15 miles an hour, and lateness at controls, beyond a ten minutes leeway meant a deduction of one point per minute, while repairs, adjustments and replacements were charged at the rate of one point per minute.

Lobdel's Brush runabout was the only car that did not check in at Saginaw at the finish of the day's run, but several drivers had points marked against their original 1,000 points. While ploughing through the deep mud just outside of Saginaw, Houston's Pope-Hartford hit a stump, which caused the starting crank to bend. It took 14 minutes to straighten it and these were the only points he lost on the run. White's Cadillac and Scott's Ford each lost one point, and Neumann's Welch lost 11

points on the first leg of the course. Machesky's Thomas finished on time despite the fact that it stopped some minutes to fish the Brush runabout out of a creek into which it had skidded.

When the second day's run ended at Kalamazoo on Thursday night, 152 miles having been covered from Saginaw, 16 of the original number of starters still had perfect scores. The worst roads were encountered between Saginaw and Lansing, where the noon control was located, but from the State capital to Kalamazoo was comparatively easy going. The drivers who fell from the clean sheet brigade in the second day's journey were: Garland (Cadillic), Mandell (Brush), McCalmont (Jackson), who quit. Schofield (Stevens-Duryea), Young (Stevens-Duryea), Bleasdale (Maxwell), Gilmore (Mitchell), Cunningham (Ford), Schiefler (Jackson), and McMullen (Cadillac.

Although several cars suffered a further reduction in scores on the last leg, from Kalamazoo to Detroit, 143 miles, only three of the perfect scores were reduced. These were Lemmer's Cadillac with 8 points; E. H. Chapin's Northern, with 1 point, and Seidler's Jackson, disqualified. Chapin's loss of one point came about in an unusual manner. He adjusted a spark coil unit, which required just 30 seconds to lose one point.

In the final adjustment of penalties Miloch's Cadillac was boosted from 453 points to 725 points, it being found that but one-half hour was taken in changing the spindle instead of five hours as was marked on the observer's card. Schuffield's Stevens-Duryea also was charged with one additional point for taking off a fender, and Harry Cunningham (Ford) lost 30 points for making repairs caused when the car went through a broken bridge through no fault of the driver. This revised summary follows:

Davis, Franklin	1,000
Lane, Stoddard-Dayton	1,000
Day, Pierce-Arrow	1,000
Sheridan, White	1,000
Grant. Thomas	1,000
Bemb. Peerless	1,000

TROOPS WILL GUARD THE COURSE

Big Preparations for Bridgeport's Annual Climbfest at Sport Hill—Nine Events on the Card.

Probably no event to be held on Decoration Day, May 30th, will attract more attention than the hill climbing contest on Sport Hill, near Bridgeport, Conn. The hill climb is an annual fixture of the automobile Club of Bridgeport, and last year Joseph Tracey was the stellar attraction, making the best time in the gasolene class.

More attention has been given to details for this year's climb than to any that have preceded it. The announcement was made this week that arrangements have been effected to have the course thoroughly patrolled by militia. The soldiers will be under the command of Captain George E. Hawes of the Fourteenth Company, Coast Artillery Corps, C. N. G. The soldiers will be in full uniform and carry the regulation rifle. As they will be sworn in as special constables they will have more power than appears on the surface. This will be a feature in automobile contests, as it will be the first hill climbing contest in America where State troops have been used to guard the course. Besides the soldiers there will be a force of Easton deputies and constables who will act as signalmen.

The first event will be started at 8 o'clock in order to have the meet concluded by noon, as the soldiers will have to participate in the Decoration Day parade which is to be held in Bridgeport in the afternoon. The course will be thoroughly oiled before the contest, and the mile incline officially surveyed. The course will be open to competitors for practice between the hours of 5 and 8 a. m. during the week before Decoration Day.

The committee made known its program this week. It consists of nine events, as follows: Class 1, gasolene cars, \$850 and under; class 2, gasolene cars, \$851 to \$1,250; class 3, gasolene cars, \$1,251 to \$2,000; class 4, gasolene touring cars, \$2,001 to \$3,000; class 5, gasolene runabouts, \$2,001 to \$3,000; class 6, gasolene cars, \$3,001 to \$4,000; class 7, gasolene cars, \$4,001 and over; class 8, free-for-all; class 9, Crauford cup for amateur drivers of gasolene cars.

The Crauford cup is offered by Robert B. Crauford, who won the Yale cup last year, and, as stated, is for amateurs.

Planning 300 Miles Race for Denver.

Although the course has not yet beet made public, it is expected that a 300-miles road race for stock chassis will be held in the vicinity of Denver, Colo.. on Decoration Day, May 30th. G. A. Blanchard, for several years identified with automobile interests in Colorado, is promoting the contest.

OHIO LAW NEARS COMPLETION

Will Establish State Regulation and Prohibit Local Enactments—Flat Rate Fees and Speed Limitations.

If the Ohio State Senate concurs in the amendments which the House has made to the automobile measure known as the Ward bill, the Buckeye State soon will have what is to be known officially as the "automobile law." One of these amendments gives a person run down by a motor vehicle the right to bring suit in the county wherein the accident occurred instead of in the county where the owner of the machine lives; another compels the owner of the car or the chauffeur to stop and give his name and address if requested by any person injured by the car; a third requires the display on the car of only two lighted lamps at night. whereas the original bill required the carrying of a red light in the rear as well.

The bill as it stands establishes a system of State licenses for machines and chauffeurs. It relieves motorists from danger of arrest for violation of local ordinances, which it repeals, and it forbids municipalities, townships and counties making speed regulations or other restrictions.

Owners and lessees of motor cars are to pay annual licenses of \$5 to the Secretary of State, manufacturers and dealers, \$10 for each make or style of machine, with \$2 each for duplicate certificates of the single numeral assigned to each style of motor, and chauffeurs \$2.

The Secretary of State is to furnish the county clerk with the list of registered machines and chauffeurs belonging in the county and also a sort of blacklist of the owners and chauffeurs who have been convicted of violating the law. This will enable the local courts to ascertain whether they are first or second offenders.

Every motor vehicle must carry its number in front and behind, and from half an hour after sunset to half an hour before sunrise two lighted lamps. Each chauffeur must wear an oval aluminum badge, and both he or any other person may be fined for carrying off a machine without the permission of the owner. Chauffeurs are subject to fine and imprisonment, as are owners of machines, and in addition a chauffeur may be suspended from the right to do business for 30 days on the second offense, and a year on the third offense.

The speed limits are eight miles in the business portions of municipalities, 15 mles in other parts of town, and 20 miles on country roads. The operator of a motor car must stop on signal when meeting or overtaking a horse-drawn vehicle or person or horseback, but need not stop longer than necessary for the safe passage of the two vehicles. Both carriages and automobiles on meeting either carriages or automobiles

must give half of the road, and persons on horseback or bicycles must give two-thirds of the road to carriages or automobiles.

Revenues for licenses shall be quined into the State good roads fund. Residents of other States which have automobile laws substantially like the Ohio law need not comply with the Ohio law, provided they comply with their own law while motoring in Ohio.

What the Legislature Did About Roads.

In the closing hours of its session the New York State legislature appropriated \$3,000,000 to be used for the development of good roads. State Engineer Skene had asked for \$7,000,000 for this purpose and on finding that only \$3,000,000 had been appropriated for this year, only \$1,000,000 of which is immediately available, and \$2,000,-000 in October, has written to the governor that the appropriation and the conditions under which it is given make it absolutely of no use for its intended purposes. In his letter to the governor the State engineer calls his attention to the law which requires that all appropriations for road building must be divided among 46 counties and the \$1,000,000 now available for the purpose would build only from one to three miles in each county.

Among the laws enacted by the legislature was one providing for the creation of a department of highways which will be created on the 10th of January, 1909, by the incoming governor, who will appoint three commissioners, one each for a period of two, four and six years respectively, thereafter all terms to be for six years. It will be their duty to work out the intelligent development of the highways of the State of New York, and they are particularly charged and given power to create a department which shall have nothing to do but maintain roads when once they are built.

Tax Assessor Discouraged by Cheap Cars.

County Assessor Shriver, of Douglass county, Nebraska, is disgusted. In fact, he has almost made up his mind to close out and move into some other county. For years the assessor has prided himself on living in a county where nothing but the best is used, but something has happened to change his mind. Shriver has just finished assessing automobiles, and although there are 392 cars in Douglass county, not one of them is valued at more than \$500 by the owners, the valuations ranging from \$150 to \$500. The assessor had thought that several \$6,000 cars were owned in Omaha. at any rate, but now concludes he must have been mistaken, and that Douglass county is "cheap" when it comes to automobiles.

Race Meet for Salem's Mile Track.

It was announced this week that the Salem Horse Show and Athletic Association will hold a race meet in Salem, N. J., on May 30th. There is a mile track there which will be employed.

INDIANAPOLIS "SQUEEZE" UPHFLD

City Ordinance Imposing Local Tax on Automobiles Declared Valid—Dealers Give up the Fight.

Judge Allen, sitting in the Circuit Court of Indiana, has sustained the validity of the Indianapolis ordinance which provides for a local annual tax of \$3 on all automobiles used within the city limits.

To bring the matter to a decision, one of the automobile dealers was fined in Police Court for failure to pay the city license fee of \$3, and he appealed his case. On the appeal, the dealer filed a demurrer to the city's complaint, raising two points—the question of whether the ordinance conflicts with the State law, and whether the wording of the ordinance, which says horseless carriage," covers motor trucks.

Judge Allen, of the Circuit Court, overruled this demurrer, holding that the ordinance does not conflict with the State law, inasmuch as the former is a revenue measure, solely, to raise funds for street pavement maintenance, while the State law is a police regulation. This was the point made by the city in the case, so that its contention seems to be clearly upheld by the court's ruling.

City Controller Greunig said that, since Judge Allen had upheld the city's contention in regard to the ordinance, all automobile owners would be compelled to pay the \$3 fee required. The dealers have decided to accept Judge Allen's decision.

Must Not Sell Gasolene on Sunday.

Automobile owners in East Orange, N. J., and more than 200 cars are owned in that city, are up in arms over the action of the Common Council in passing a Sunday closing ordinance which will prevent them from purchasing gasolene on that day, should their supply become exhausted. Few of them have facilities for keeping gasolene on their premises, and it has been a general custom to obtain supplies at the nearest garage when starting out for the Sunday jaunt. The garagemen are equally distressed by the new regulation, which means a loss in sales of gasolene.

Automobile Caravan for Denver Delegates.

Automobiles have become identified with the development of political campaigns, but evidence is not lacking that this fall will see even more striking advances in this line than have been witnessed hitherto. One of the incidents of the forthcoming Democratic convention in Denver, next July, will be the arrival of a number of the Illinois delegates in an automobile caravan. Four seven-passenger touring cars and a luggage wagon will be employed for the purpose. A week will be occupied in making the trip from Chicago to Denver.

SHOWS WHAT'S AROUND THE TURN

Device to Prevent Accidents on Intersecting Roads—Simple Application of a Well Known Principle.

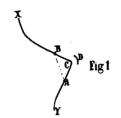

So many accidents have resulted from carelessness in approaching "blind" corners on the highway where the condition of traffic on intersecting roads was hidden because of the character of the surroundings, that it is coming to be recognized as important that steps be taken to safeguard such localities especially where they lie upon roads much frequented by motorists. Abroad, where speeding along the open road is openly indulged in, the danger is much greater than in this country where drivers who are exceeding the speed limit are apt to be more or less careful in approaching such spots owing to the illegality of their driving. Several methods of correcting the evil have been proposed, one of the most striking being that of erecting suitable mirrors at the intersecting corners in such a way that drivers of vehicles coming in either direction are visible to those traveling along an interferring course.

Although recently propounded in England, it is claimed that the idea originated in France, where a well-known motorist took out patents on the system which is here described several years ago. The principle upon which the system is based is readily apparent from Fig. 1, where the position and arrangement of the mirror, D, is very evidently such that the driver of a car in the position A, on the road X-Y, could discern the driver of a second car at B, even though the direct line of sight A-B might be obscured by buildings or some natural obstruction.

The type of reflector necessary to accomplish the desired purpose would be planoconcave in form, and for purposes of economy is made up of a series of rectangular panes mounted in a curved frame as shown in Fig. 2. A series of vertical sashes or Tirons, b, are placed in the framework, to form guides into which the afit plates, a', are slid, seating below in the bottom plate, c, and being covered above by the closing piece, d, while for purposes of protection a screen, e, is also placed in front of the plates. The general appearance of the mirror and its standard is shown in Fig. 3, which also indicates that the arrangement need not of necessity be in any way a disfigurement to the landscape.

The curve of the framework, to which the glass plates conform as closely as possible, is laid out with respect to the angle of the intersection and is arranged to reflect a distinct image of each of the approaches to the turn in the direction of the other. A point which should be mentioned in this connection is that the advantages of the

arrangement at night would be even greater than in the daytime, since the headlight beam from approaching cars would be thrown directly in the drivers' eyes, rendering the danger signal very effective. In daylight, of course, the system would be of no avail unless one or the other of the drivers were to look directly at the mirror.

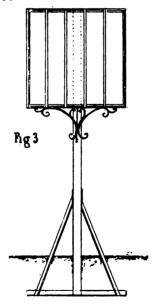

At night, the sudden flash of light would serve as an unmistakable warning.

Of other proposed means of protecting highway intersections, the most readily suggested and at the same time, the most difficult of achievement relate to the clearing of the ground in the immediate vicinity of the corner for a space sufficient to enable drivers to watch the intersection for some

little distance on either side of the turn To effect this, legal provisions would have to be made in most cases, while frequently the enforcement of even a perfectly satisfactory law would be accompanied by many difficulties and endless expense. Hence, as a simple and comparatively inexpensive method of protection the system in question would appear to be the most practical solu-

tion of the difficulty. A further adaptation of the idea might include a comprehensive and accurate sign board system with roadmarkers to be mounted over each mirror, in which case, the attention of drivers would be more likely to be attracted to the latter than if they stood by themselves.

COMPLETE ELECTRIC PLANT ON CAR

New Ignition System Which Produces Its
Own Current—Automatic Lighting and
Original Indicator Devices.

While electricity performs an indispensible part in the operation of automobiles, its chief servce has been in connection with the explosion of the charge in the cylinder. As the development of motor cars progressed, electricity came into common use for the illumination of limousine bodies, and occasionally for side and head lights, and in the operation of various accessories, but it has remained for the Witherbee Igniter Co., New York, to show the manifold use which could be made of electricity in connection with automobiles, and recently this company equipped a car for M. R. Hutchison with the most complete electrical installation ever put in an automobile.

This electrical equipment consists of two Witherbee No. 86 batteries connected in series, located under the rear seat of the machine. The batteries are charged by dynamo situated under the front floor boards. A wood split pulley, attached to the shaft between the clutch and the gear box, together with the belt, drives the dynamo and air compressor, which inflates the tires and operates the pneumatic jacks for raising the machine. In addition to the dynamo there is a Wico charging device located on the running board, which enables the driver to charge the storage battery from any electric light socket.

The headlights are equipped with stereopticon incandescent lights, which can be turned off or on at will. The side and rear lights are fitted with small incandescents.

By each of the side doors of the tonneau there is a lamp turned on automatically when either door is opened, lighting the way into the tonneau where another lamp operates simultaneously by the same means, illuminating the interior.

By raising the bonnet of the engine four lamps on either side of the motor are automatically turned on. There is also a lamp in the pan under the engine, and also lamps beneath the chassis which are turned on from the switch board.

On the dash board are five lamps, illuminating the speedometer, ammeter, volt meter, pressure gauge, oil feed drips and clock.

Attached to each wheel rim is a device which indicates when the air pressure in the tires is below 60 pounds, by sounding one of the electric horns attached to the dash. An indicator on the dash locates the trouble instantly. The same horn blows, and the same indicator operates when any bearings are hot, the water in the radiator gets low, the oil in the oil box gets half empty or when the gasolene gets down to five gallons.

Putting on either of the foot brakes or

the emergency blows an electric horn attached to the rear of the car, and drops a sign "Stop." As soon as the brake is released, the horn blows and the sign disappears.

There are four lights in the folding top which may be turned on when they are needed.

On each end of the rear seat, and on the back of the front seat there is an electric cigar lighter. Situated near each of the wheels are extension lamps, for use about or under the chassis.

In the rear of the car is a box with a celluloid front, through which the license number for whatever state the car is in is visible. These numbers are painted on a curtain, and can be turned at will.

The signaling equipment consists of three Klaxon horns, and when all three are going, they can be heard for a mile distant. If the occupant of the tonneau wishes to speak to the driver, a special telephone transmitter is used, and the electric horn on the dash proceeds to talk in a loud clear tone. If the driver wishes to say a few things to a teamster, it is not necessary to waste strength shouting. He simply speaks into his transmitter and the electric horn on the mud guard repeats his words loud enough to be heard at a distance of several blocks, thus making intended warnings fully intelligible.

Automobile Transportation for Live Sheep.

In connection with the development of Punta Arenas, the southernmost, and only free port of Chile, considerable stress is being laid on the possibilities of developing the business of exporting mutton to foreign markets, a line of steamers having been arranged for to transport the dressed carcasses to the London wharves. A feature of the scheme, which is a most comprehensive one, is the use of motor traction for getting the sheep to the shipping point. Four 40 horsepower traction engines, of German construction have lately been put into service between Punta Arenas and the up-country ranches, some of which are 100 miles inland. Each of the machines is capable of drawing a train of three or four loaded wagons across the plains at a rate of four to six mile sper hour.

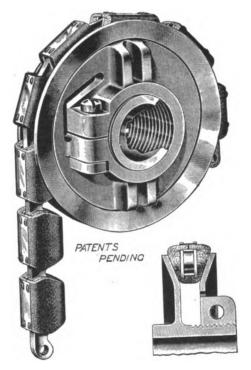

Prince Henry Invents an Accessory.

Even royalty has taken a hand in inventing automobile accessories. Prince Henry of Prussia has applied for a patent on a device to keep mud and moisture from obstructing the view through glass wind shields. The apparatus is very simple, consisting of two arms equipped with rubber edges. The arms are fastened on pivots on either side of the wind shield. A handle is located within convenient reach of the driver, and by turning this handle the rubber edges are moved over the glass, much in the manner that window washers employ when using a somewhat similar device on large store windows.

NEW SYSTEM FOR FAN DRIVING

How the Whitney Chain Belt Meets a Trying "Little" Problem—Its Characteristics and Adaptability.

What has come to be regarded as a most trying "little" problem in connection with automobile design is the construction and maintenance of the transmission to the radiator fan. A wide variety of driving principles have been adopted for the purpose at one time or another, yet owing to the peculiar conditions encountered, more or less trouble has been experienced with nearly all

of them. On this account no little interest centers about an entirely new system, which possesses the desirable features of uniform and powerful traction, a tension adjustment without idlers and independent of the center-to-center distance of the pulleys, and which while being absolutely free from "bending resistance," also is inelastic in the direction of its length and non-stretchable. These advantages are embodied in the new chain belt, which has just been developed by the Whitney Mfg. Co., Hartford, Conn.

As its name implies, this is merely a block chain shod with leather contacts of V-section, which envelop each pair of side plates and adapt them to run over a grooved pulley of approved form. The result is a transmission embodying all the advantages of the V-belt, without its stretching propensities, and also minus its resistance to bending. It may be run over pulleys of large or small diameter with equal facility, requires no idler for taking up the slack, and is adaptable to sheaves which are separated by a fixed distance. Whatever

tension adjustment is required by the wear of the leather shoes, is made by altering the distance between the flanges of one of the pulleys, thus causing the belt to travel a greater or less distance from the center.

The details of belt and pulley construction are shown by the accompanying illustration. The leathers, which are of special shape, are bent over their respective links, and secured by locking plates, which are embedded in their surfaces, and fastened by projections of the side plates, which are headed over. Prongs on the under side of the locking plates also engage the leather, making the fastening still more secure. In this way, an all-leather to metal friction contact is secured, while the rigidity and flexibility of the chain in the radial sense is unimpaired.

In the construction of the adjustable pulley one flange is formed on a collor threaded over the main hub or boss. It is split and fitted with a locking screw so that it may be fixed in any desired position, its adjustment determining the line of contact between the belt and flanges.

Besides being useful for purposes of fan driving, the chain belt also is adaptable to a wide variety of purposes in driving the different auxiliaries on the motor car. It also is adaptable to multiple uses in connection with power plants.

Encouraging Intelligent Care of the Car.

A novel method of encouraging chauffeurs to take care of their cars, with special reference to the subject of lubrication, has been adopted by a foreign manufacturer. Dating from May 1st owners of this particular make of automobiles were requested to permit a representative of the manufacturer to pay unexpected visits to their garages. The inspector will make an examination of the automobiles and will observe the condition of the cars making special note in regard to lubrication. At the end of the year the ten drivers, whose cars have received the best reports, will be awarded \$125 each.

Separate Receptable for the Carbide.

When cars are equipped with acetylene generators it is far better that the carbide should be carried in a separate receptacle rather than in the generator when the latter is not being used. As carbide is keenly susceptible to atmospheric conditions, it is absolutely essential that it should be kept perfectly dry until the gas which it generates is wanted for illuminating purposes. In the generator in which water is contained, the proximity of the water to the carbide usually effects the latter, and when gas is required it frequently is found that the generating power has been exhausted.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

WHAT IS GOING ON IN CLUBDOM

Preparing to Fight Jersey's New Law—San Antonio to Have Race Meet— Elections of Officers.

There was no opposition to the election of Paul E. Heller as president of the New Jersey Automobile and Motor Club of Newark, at the annual meeting on Monday night, and aside from the passage of a resolution authorizing the board of trustees of the club to contribute a certain sum to a fund that is being raised to test the constitutionality of the New Jersey automobile law and contributing \$150 to a local hospital, the The retiring meeting was a quiet one. trustees presented H. A. Bonnell, the retiring secretary, with a superb silver service as a token of appreciation for his valuable services. The new officers of the New Jersey club are: Paul E. Heller, Newark, president; W. Olive Crosby, East Orange, vice-president; Dr. James R. English, Newark, treasurer, and A. B. Le Massena, Hoboken, secretary. The five trustees, who were re-elected for a term of two years, were William C. Shanly, Dr. Frank B. Meeker, Frederick A. Croselmire and A. G. Scherer, Newark, and H. A. Bonnell, East Orange. The two hold-over trustees are Joseph H. Wood and W. F. Kimber.

An elaborate race meet, to equal the Vanderbilt and other classic road races, was talked of at the annual meeting of the San Antonio (Texas) Automobile Club, and a committee was empowered to sound the business men of the Texan city as to the feasibility of the project. At the meeting officers were elected as follows: President, Dr. W. B. Russ; vice-president, H. E. Ogg; secretary, Dr. George M. Fairfield; directors, R. W. Carr, E. R. Richardson, Dr. W. B. Russ, Dr. E. J. Fieldin, Dr. George M. Fairfield, H. E. Ogg and C. C. Cresson.

At an enthusiastic meeting, attended by more than 100 owners, the Columbus (O.) Automobile Club was formed last week. The work of organization was due chiefly to the efforts of the Ohio State Automobile Association, of which the new club will become a member. Officers were elected as follows: President, Max Morehouse; first vice-president, P. B. Monypenny; second vice-president, Dr. George P. Stephenson; secretary, Herman A. Hoseter; assistant secretary, A. Miller; treasurer, E. M. Schoenborn

At its annual meeting the Iowa Automobile Club of Des Moines decided to hold an endurance contest, but the selection of a date was left until a future meeting. Officers were elected as follows: President, John Gibson; first vice-president, L. Aulman; second vice-president. W. W. Sears; secretary, Cheney Prouty; executive committee, E. T. Meredith, Vere Reynolds and Harold Wells.

The following officers were elected at the annual meeting of the Mankato (Minn.) Automobile Club: President, John H. Hohmann; vice-president, F. K. Meagher; secretary, Frank Brett; treasurer, B. Bangerter, Jr.; trustees, George M. Palmer, C. Saulpaugh, and G. A. Lewis. The club shortly will publish "a book of rules for the running of automobiles," which will be distributed to the members.

Forty automobilists of Kankakee, Ill., have organized the Kankakee Motor Club with the following officers: President, H. A. Magruder; vice-president, Louis Beckman; secretary-treasurer, Dr. C. K. Smith; directors, Alden Brown, George Fortin, Henry Volkman and F. D. Martin. The last named was made chairman of the membership committee.

Mason City, Iowa, now has an automobile club, the Midland Automobile club having been formed with the following officers: President, A. J. Zingre; vice-president, J. F. Emery; secretary-treasurer, W. H. Hathorn.

The Grand Rapids (Mich.) Automobile Club has elected these officers for the ensuing club year. President, Dr. Emmett Welsh; vice-president, J. R. Jackson; secretary, Dr. William Burlson.

Memorial Day Race Meet at Readville.

Prospects for an interesting race meet at the Readville track at Boston on Memorial Day, May 30th, appear in a preliminary announcement by the race committee of the Bay State Automobile Association that it will promote a meet on that date. The events as arranged are seven in number, five for automobiles and two for motorcycles, as follows:

Five miles open to stuck gasolene touring cars of from 24.1 to 40 horsepower. Five miles open to stock touring cars from 40.1 to 60 horsepower. Five miles open to all gasolene runabouts, irrespective of horsepower. Twenty miles open to stripped stock chasses. Five miles handicap. Five miles open to single cylinder motorcycles. Five miles free-for-all, motorcycles, open to all classes.

Women to Make Transcontinental Tour.

And now the transcontinentalette! On Thursday next, 14th inst., two women-Mrs. E. E. Teape and her daughter, Mrs. Vera McKelvie, of Sands Point, Idahoare due to start from Portland, Maine, to make a 4,000 mile trip across the continent to Portland, Ore. Their route will be via Boston, Springfield, Albany, Syracuse, Buffalo, Cleveland, Chicago, Des Moines, Cheyenne, Salt Lake City, Ogden, Boise City and Baker City, to Portland. The undertaking is worthy of remark in that so far as is known it is the first trip over this route, and also because these two women will be the first to attempt such a long journey unaided by men. They will drive a two-cylinder runabout and will take things leisurely.

NEW NAME FOR THE CARBURETTER

Amusing Proof that "a Little Knowledge is a Dangerous Thing"—Ludicrous Blunder in Technical Terms.

It long has been said that "a little knowledge is a dangerous thing." To this statement might be added something to the effect that the possessor of a "little knowledge" is apt to make himself ludicrous, as the following incident serves to show.

To a city official had been assigned a municipally owned automobile and a municipally employed chauffeur. The machine was of ancient vintage, but the driver was as fresh as a new laid egg. The combination was one that probably would be the means of causing the official much weeping, wailing and gnashing of his store teeth, for he was an elderly man who was "sot" in his ways and not favorably disposed toward motor cars or vehicles masquerading as such.

One of the chief characteristics of the official was his willingness to talk with anybody on any subject under the sun. It mattered not whether the topic was religion, politics, mechanics, or anything else, he would enter the discussion with a vim and an assurance of manner that usually impressed his hearers with a belief in his knowledge of the subject. Naturally his friends, even those who knew he had never before ridden in an automobile, were not surprised to hear him hold forth on spark plugs, cylinders, pistons, water system, pumps, etc., after two or three days of riding in his recently acquired machine.

The machine had been in use a week or two, when one day the chauffeur, wanting the afternoon for himself, caught his heel in the ground wire, and disconnected it. At the time of the "accident," the boss was en route to keep an appointment with the head of the department and the stopping of the machine in the outlying district, far from trolley cars was a decided inconvenience. He telephoned at once for his horse and carriage, and finally drove away.

While waiting for his carriage, he had watched the chauffeur, who apparently was looking for the trouble, and while looking, the latter was imparting much information. When the official reached his office he called up his superior to explain his failure in keeping the appointment.

"What was the matter, Mr. Blank? It is anything that will lay up the machine for a while?" asked the executive, over the 'phone.

"No, I think not," responded Mr. Blank? I didn't make a complete examination, but from the way the engine acted I think there must have been some water in the fumicator." And Mr. Blank, for a long time, wondered what caused the road of laughter that greeted his diagnosis.

SIXTEEN CONTESTANTS WON CUPS

Triumphed Over Rough Roads and Frequent Fords in Baltimore Sealed Bonnet Contest—Sixteen Failed.

When it first thought of promoting a scaled bonnet endurance contest for automobiles the Baltimore newspaper that did conduct one on Saturday last, 2d inst., evidently did not take into consideration the reliability of present day motor cars. Quite frankly, it did not expect any of the 32 cars that started in the 147.8 miles run from the Monumental City to Hagerstown and return to finish with absolutely clean sheets; or, if any, then not so many as did. For be it known that of the 32 starters exactly one-half of that number completed the journey over hills and roads that are not by any means boulevards without a single count against them. In view of this the promoters, instead of the three cups for the highest scores, will give each perfect scorer a cup for himself.

The test was a success as well as a revelation. It was the first that had ever been conducted in Maryland, but it will not be the last of the sort, as President Reese, of the Automobile Club of Maryland, has announced that the organization will conduct a similar contest next fall.

The test reminded one of the drivers of the sandwiches he used to get at a charitable institution which he was investigating in the pursuit of his socialogical studies. The roads were like those sandwiches-"they were good at the start and good at the finish, but they were atrocious in between." Which, in a large measure, explains why the other half of the starters failed to finish with perfect scores. When the mountains were reached the better stretches of roadway were like that side of Pen Mar known as the devil's race course; the worst parts cannot be described. Ruts, boulders, cliffs, holes, logs, marked them and the occupants were bumped, jolted and bruised, as well as soaked and drenched when the cars plunged into the many fords that had to be crossed.

The route on the out trip was from Baltimore to Westminster, through Fritzell, Tryone, Copperville, Taneytown, Bridgeport, Emmitsburg, Eyler, Lantz, Foxville, over the Blue Ridge mountains to Cavetown, to Shewsville, and then to Hagerstown, most of the cars arriving at the last named place before noon. So far as scenery is concerned a more beautiful route could not have been chosen. The return trip was made via Middletown, Frederick, New Market, Ridgeville, Ellicott City and finishing at Baltimore. The first car arrived at 2.30 p. m., and the last car of the perfect scores checked in at 6.32. A shower was met on the way back, but it did not hinder the contestants. Twelve hours was the allotted time for perfect scores, and the sixteen that finished without marks against them were as follows:

Howard Gill, Thomas; Wallace Hood, Thomas; Hardesty, Packard; Lorido, Locomobile; McCormick, Oldsmobile; J. White, Buick; Tremblay, White; William Keyser, Packard; Hall, Franklin; Clarke, Pierce-Arrow; Foster, Cadillac; Cody, Thomas; R. F. Kayler, Ford; Barker, Packard, T. F. Goodwin, Winton, and P. Reese, Jr., Royal Tourist.

Program for the Giant's Despair Climb.

The hill climb committee of the Wilkes-Barre (Pa.) Automobile Club made known this week its program for the third annual Memorial Day hill climb up Giant's Despair mountain. It is even more elaborate than the card last year, and includes twelve events as follows: Open to gasolene stock cars selling for \$850 or less; open to gasolene stock cars selling for from \$851 to \$1,250, inclusive; open to gasolene stock cars selling from \$1,251 to \$2,000; open to gasolene stock cars selling for from \$2,001 to \$3,000, inclusive; open to steam or gasolent stock cars selling for from \$1,250 to \$3,000; open to gasolene stock cars selling for from \$3,001 to \$4,000; open for fourcylinder stock cars selling for \$4,000 or over; open to six-cylinder stock cars selling for \$2,500 or over; free-for-all, open to cars of all types and motive power; open to gasolene stock chassis not exceeding a total piston area of 103.87 square inches, all Briarcliff models eligible; open to steam cars only; open to cars owned by members of the Quaker City Motor Club.

Four-Mile Circuit for a Road Race.

Although it has never been in favor of track racing the Indiana Automobile Club has signified that it is in favor of road racing by arranging a big race over a four mile circuit around Riverside Park, Indianapolis, on July 4th. Although the preliminary announcement has only been made many of the details have been worked out. The course selected is in view from a certain point for about three-quarters of the distance and here it is proposed to erect a big grandstand. It was announced that 150 special policemen will guard the course. Carl G. Fisher has offered a \$500 trophy for the race which will be for stock chassis.

Albany to Have Its First Hill Climb.

The Albany (N. Y.) Automobile Club will hold its first hill climb on Menand hill, near that city, on Saturday afternoon, May 23d. Eight events are carded, as follows: Gasolene cars selling for \$850 or less; gasolene cars selling from \$851 to and including \$1,250.; Gasolene cars selling from \$1,251 to and including \$2,000; gasolene cars selling from \$1,251 to and including \$3,000; steam, gasolene or electric cars selling from \$2.001 to \$3,000; gasolene cars selling from \$3,000 to and including \$4,000; six-cylinder cars selling for more than \$4,000.

SAILORS TREATED TO A SANFEST

"Fighting Bob's" Men See Lively Racing at Long Beach—Close Contest in the Free for All Event.

One of the features of the entertainment of the fleet now in California was a race meet at Long Beach on Friday, 24th ult. Although no records were broken the thousands of sailors and officers, to say nothing of all the Long Beach resorters, thoroughly warmed up to the sport. A course 2½ miles long had been measured on the sand and the beach was hard and firm.

The most exciting event was the free-forall for stock cars, which was won by George Barnes, driving a Haynes. Barnes took the lead at the start and was never headed although Harrison, in the Oldsmobile, gave him a hard fight right up to the tape. The race resulted in a challenge by Dan Kuhl, whose Mercedes had won the previous event, but when Barnes got the money ready, it is stated that Kuhl could not be found. The summaries:

For two cylinder runabouts carrying two passengers—Won by C. M. McKeague, Duro; second, D. W. Hawthorn, Dolson; third, J. McKenzie, Reo.

For two cylinder touring cars, carrying four passengers—Won by F. M. Varney, Tourist. Time, 3:41½.

For four cylinder cars, 20 to 40 horsepower, carrying four people—Won by H. O. Harrison, Oldsmobile; second, G. F. Grant, Tourist.

For touring cars carrying four people—Won by Dan Kuhl, Mercedes.

Free-for-all stock cars—Won by George Barnes, Haynes; second, H. O. Harrison, Oldsmobile. Time, 3:003/5.

Motorcycle sweepstakes—Won by Allen Murphy, Indian; second. Clarence Clayton, Indian; third, Frank Klecker, Racycle.

Races to Celebrate Subway Extension.

That portion of Jamaica, Long Island, designated as Hillside avenue, will for once in the history of automobiling be free from arrests for speeding one day next month. There are, perhaps, more arrests made every Sunday over this road than on any other boulevard on Long Island, but on Friday afternoon, June 5th, the motorcycle policeman will be minus an occupation. In celebration of the extending of the Brooklyn subway to Jamaica the committee in charge of the jubilee has decided to promote a series of mile time trials on Hillside avenue. The fact that Fred J. Wagner virtually is in charge of the affair and that the Long Island Automobile Club is taking an active interest in it, presages success. The trials, for all classes of cars, will be held over a mile straightaway stretch, allowing one mile for a flying start and a mile beyond the tape to slow down.

NEW TRACK-CARRYING TRACTOR

Radical Departures in Construction of Heavy Cross Country Vehicles—Features of the System Adopted.

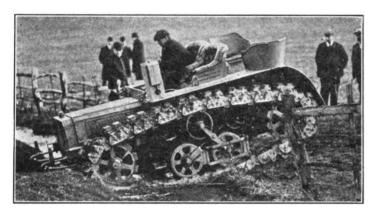

Problems connected with motor traffic outside the confines of the highway are not, as a rule, of appreciable interest to the average motorist. Nevertheless in vehicles intended for use in connection with military manoeuvres and for agricultural purposes, they are of vast importance. Several different types of vehicle have been designed for cross country operation, all of which are based upon the principle of increasing the amount of surface in contact with the

the chain, at all times presents a smooth path for the supporting wheels to roll upon, while the exterior is fitted with resilient supporting blocks, to afford traction and relieve the inequalities of the ground to a certain extent, as well.

From the accompanying illustration the general arrangement of the machine will be apparent. The chain, D, is carried by the sheaves, A, and B, the former of which is geared to the motor and drives the chain by the meshing of cogs on its periphery with the ends of the pins by which the members of the chain are articulated. The sheave, B, is moveable so that the tension of the chain may be adjusted according to requirement, while the slack of the upper side is taken up by an adjustable idler pulley, E. The entire weight of the vehicle

means of secondary links, of similar construction, which served the purpose of distance pieces. The arrangement indicated is applied to both sides of the machine, two complete tracks being formed in this way for the two sets of bearing wheels, and both being independent save for the driving connection, which is made through a differential gearing of ordinary form.

An unusual provision, is that by which steering is effected. In order to accomplish this, the rate of travel of the respective tracks is altered by applying a brake to one side or the other of the differential. This is done through the medium of an ordinary steering wheel, the effect being practically the same as would result from braking one of the wheels of a live axle. It is asserted by the Automobile Journal, in which an ac-

GOING IN AND OUT OF A BROOK

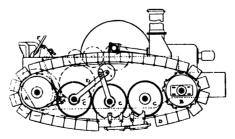

CLIMBING A "ONE IN TWO" CLAYBANK

ground, and also of reducing the unit pressure on that surface. One of the most unique of these is the Hornsby "chaintrack" tractor, which is produced by Messrs. Hornsby and Sons, makers of the Hornsby Akroyd heavy oil engines, which have been favorably known in England for many years. Its principle is that of laying down a temporary roadway or track over which the machine may run, and which is automatically picked up after use and transferred to the forward end of the machine to be used again. It differs from a system of similar nature, at one time proposed in this country, in that the track extends the full length of the vehicle and is so constructed that it acts as a sort of bridge, following the average grade of the ground, and therefore presenting a perfectly uniform path for the load-carrying wheels upon which the vehicle itself is carried.

As far as the construction of the power plant and the tractive and load carrying features of the vehicle are concerned, it is not radically different from the ordinary heavy commercial vehicle. It is, in fact, built for use with either heavy oil or gasolene, according to local demand and possessed the usual transmission and change gear features.

The "track" consists of an endless chain band, running over sheaves at the front and rear ends of the machine, and driven from one of the sheaves only. The interior of is carried by the wheels, C, running on the track formed by the inner surface of the chain.

The design of the chain itself, is particularly unique. Two sets of links are incorporated in its construction. Those which may be termed the main links, consist of heavy castings, cored out on the under side to receive the wooden bearing blocks upon which the machine rests. Upon their upper surfaces they are channeled out to receive the bearing wheels, while at their ends are abutments, so constructd that while unlimited flexure is permitted in a downward direction, the links are rigidly placed with regard to pressures from below. In conse-

35 HORSEPOWER TRACTOR

quence of this, the lower part of the track at all times forms a sort of girder which is capable of supporting the machine from two or more points. Connection between the respective main links is accomplished by count of this machine recently appeared, that the steering device is so successful that it is possible to turn the tractor in its own length, inconceivable though it may seem.

In regard to the performance of the tractor, the same authority mentions a test in which "On swampy ground, a 'lurry' loaded with three tons was hauled by five horses until it sank to the axles, when the horses failed to drag it out. The 30-35 horsepower motor car model, weighing 3 tons 15 cwt., and hauling a trailer loaded with five tons, and equipped with the chain track in lieu of wheels, then proceeded to travel over the same ground, and negotiated it successfully. Horses were subsequently harnessed to the car itself, and succeeded in dragging it across the test ground, notwithstanding the fact that they had failed with the lurry, and also with a twowheeled cart carrying 11/2 tons.

"As a test of its hill climbing capacity, the Chain-Track tractor showed itself to be capable of surmounting a bank of soft clay 20 feet high, having an incline of 1 in 2."

At present three of these machines are in use. One is in operation by the British War Office, and it is stationed at Aldershot, where it is known as "Caterpillar No. 1." Of the two others, one of 20 horsepower, is propelled by an oil engine, while the second, which is shown in the accompanying illustration, is of 30-35 horsepower and driven by a gasolene motor.

SOLVING "USED CAR" PROBLEM

Bowen States a General Difficulty and Explains His System—Making Cars Dependable as Well as Saleable.

"The Motor World's editorial on the 'Used Car Situation' was of especial interest to us because, like a good many other automobile firms, we have been endeavoring to find the right solution of this problem for some time paast," was the observation of Frank H. Bowen, of the Harry S. Houpt Co., New York and New Jersey agents for the Thomas car to a Motor World man. Mr. Bowen's official title being that of "Manager, Used Car Department," his version of the problem itself, and the method of solving it with which he is most familiar, naturally carry no little weight.

"The practice of turning over all secondhand cars to dealers, who make a specialty of handling them, has resulted in their being sold and put on the road without any preparation whatever, although generally in need of a thorough overhauling," he continued, "and a total break-down is bound to result in a short time. The new owner is naturally disgusted, and invariably places the blame on the car itself. In view of this fact we have evolved the following plan, which has eliminated this objectionable feature.

"As soon as the car which has been taken in exchange is received, it is taken down in our own shop, all parts showing wear or misuse are replaced by new parts, and the entire car is reconstructed, taking every bolt and nut into consideration. The car is then taken to the paint shop, where it is entirely repainted and the upholstery redressed.

"When the car has received the final test, both in the shop and on the road, it is placed on sale on the 'used car floor,' at a price which is plainly marked, and from which there is no deviation.

"Our policy is that the owner of a Thomas car is a Thomas customer. The same attention to the upkeep of a second hand car will be given to the new owner as would have been given to the original owner.

"Though this policy has been in force but a short time," he concluded, "these cars have been sold to a very different class of customers than ever before purchased second-hand cars. In fact, the system has brought us into touch with a class of buyers who, in the past would not consider any but a new car."

Paris Shies at Shabby Buses.

Motor omnibuses in Paris are not as popular as they are in London, or other great cities, it would appear, owing to the economical policy of the operating company, which has refused up to this time to install

a proper equipment, or to accede to the demands of the riding public and the landlords along the routes. Consequently the stock of shabby vehicles, said to number not more than a hundred, continues to ply the streets under a growing cloud of disfavor. The unpopularity of the vehicles is due solely to the fact of their being mechanically unfitted for the service which is expected of them, and it is thought that a better equipment would not suffer the same oprobrium. The root of the difficulty rests in the fact that the concession of the Paris Omnibus Co., is to expire in 1910, and that negotiations for the renewal of its monopoly have not as yet been completed.

When the company was persuaded, somewhat tardily, to adopt the use of motor vehicles, instead of ordering a complete new installation of rolling stock, the chassis were specified to fit the bodies of the old threehorse omnibuses, of which a great number were already on hand. Consequently the vehicles are unwieldy and unsightly. This fact, added to the poor maintenance afforded them is responsible for their low standing at present. The public complains of their cramped and vibrating accommodations, while the shopkeepers along their courses complain of the dust they stir up in dry weather and the mud they sling when it rains. That brand of economy which is characterized by its penny-wisdom and pound folly, never is destined to succeed where the traveling public is concerned.

Franklin Truck to be Fitted to Rails.

The possible usages of the motor truck seem to be almost unlimited. The H. H. Franklin Mfg. Co., through the Quaker City Automobile Co., their Philadelphia dealers, have just sold one of their 2,000-pound trucks to the Thacker Coal & Coke Co. This truck will be fitted with wheels with steel flanged rims and will be run upon railroad tracks throughout the Pennsylvania mines and shipping yards of the Thacker Co.

War Department Calls for Supply Wagon.

Specifications have been issued by the War Department covering the construction of a supply wagon for use by the signal corps of the United States army. As evidence of the satisfactory service Franklin motor cars have already given in the service of the United States Government, the Franklin people point out that the specifications for this supply wagon calls for a 24 horse-power air-cooled motor.

The Oakland Car Working Its Way East.

One of the smartest and most attractive cars ever offered for the price, the Oakland, the latest creation of A. P. Brush, has been unduly long in gaining a foothold in the East. A beginning has been made, however, the Bergdoll Motor Co., of Philadelphia, having been allotted a choice parcel of eastern territory and negotiations being under way for New York representatives.

MAY MEAN NEW IGNITION SYSTEM

Phenomenal Qualities Ascribed to Recently
Discovered German Alloy—Its Alleged Free Yield of Sparks.

It it possible that the application of a phenomenon which is at present attracting no little attention in German scientific circles may ultimately lead to the extinction of the electric equipment in connection with the ignition system of the internal combustion motor. If practicable, it would lead to the adoption of an igniter similar to the old-time flint-lock of small-arm history.

"It has been discovered" according to Consular authority, "that an alloy of iron and cerium, lanthanium, or any other of the rare earths (as used in manufacturing incandescent gas mantles) will create luminous sparks on being struck with some metal tool, such as a knife edge, a file, or the like. The shower of sparks given off at the point of impact is sufficient to ignite not only gas, but even a cotton wick saturated with alcohol, and it is possible to utilize these iron alloys for igniting all sorts of explosives. The behavior of these alloys has been found to vary according to their percentage of iron, the sparking reaching a maximum with a content of 30 per cent.'

Such a development would seem almost too economical to be a commercial possibility. At the same time, it is by no means inconceivable that the hammer and anvil igniter with striking points composed of alloys of rare earth and iron may be a feature characterizing motor equipments of the future.

Self-Applying Anti-Skid Shoe.

A recent foreign invention in the non-skid line, is constructed in persuance of a scheme which has been tried on the London omnibuses, in which a chain is suspended along side each of the rear wheels in such a way that when any side slip is developed the chain is pulled under the tire and offers sufficient resistance to check the action. In the new system, a leather strap is employed, which is suspended from a couple of springs attached to the axle in such a way that the center of the loop thus formed lies close along side the tire on the inside of the wheel. A flat plate, made of leather and copiously studded, is attached to the strap at this point, with an offset edge projecting toward the tire. When the skidding tendency is developed, this shoe is immediately drawn under the wheel and forms a positive hindrance to the objectionable action. While more crude, and probably less satisfactory in action, it is to be observed that such an arrangement would possess this advantage over the ordinary anti-skid tire, that present objectionable park ordinances would not affect its use.

FRELINGHUYSEN'S "MASTERPIECE"

Full Text of Revised New Jersey Law-Commissioner Smith Will Recognize Unexpired Licenses.

New Jersey's revised system of "admission fees" and "passports," otherwise the amended Frelinghuysen law, now is in full force, and J. B. R. Smith, the able Commissioner of Motor Vehicles, has his hands full in putting it into effect.

Although one arrest has been made of an automobilist who had a paid-up license under the old law, Mr. Smith has ruled that such licenses and registration certificates shall hold good until one year from their dates. For instance, any "passport" that does not expire until July or September next will be recognized, but for the remainder of the year, the holder must pay the full rate named by the new law.

The full text of the law is as follows:

PART I.

Definitions.

1. As used in this act:
(1) The term "motorvehicle" includes all vehicles ropelled otherwise than by muscular power, excepting such vehicles as run only upon rails or tracks.
(2) The term "motor cycle" includes only motor vehicles having pedals and saddle with driver sitting

astride.
(3) The term "automobile" includes all motor ve-

(3) The term "automobile" includes all motor vehicles excepting motor cycles.

(4) The word "magistrate" shall be deemed and understood to mean and include all justices of the peace, judges of the city criminal courts, police justices, recorders, mayors and all other officers having the power of a committing magistrate.

2. Automobile fire engines and such self-propelling vehicles as are used neither for the conveyance of persons for hire, pleasure or business, nor for the transportation of freight, such as steam road rollers and traction engines, are excepted from the provision of this act.

PART II.

The Construction and Equipment of Motor Vehicles. 3. Every motor vehicle must be equipped with a plainly audible signal trumpet.

plainly audible signal trumpet.

4. (1) Every automobile shall carry, during the period from thirty minutes after sunset to thirty minutes before sunrise, and whenever fog renders it impossible to see a long distance, at least two lighted lamps, showing white lights, visible at least two hundred and fifty feet in the direction towards which said automobile is proceeding, and shall also exhibit one red light, visible in the reverse direction. Upon the fronts of the two aforesaid lamps showing white lights shall be displayed, in such manner as to be plainly visible when such lamps are lighted, the number of the registration certificate issued as in this act provided, the same to be in Arabic numerals not less than one inch in height.

less than one inch in height.

(2) Every motorcycle shall carry, during the period from one hour after sunset to one hour before sunrise, and whenever fog renders it imnossible to see a long distance, at least one lighted lamn, showing a white light visible at least two hundred feet in the direction toward which the motorcycle is proceeding.

5. Automobiles of more than ten horsepower shall be provided with at least two brakes, nowerful in action and separated from each other, of which one brake must act directly on the drive wheels or on the parts of the mechanism which are firmly connected with the wheels. Each of the two brakes must suffice alone to stop the automobile within a proper time. One of the two brakes must be so arranged as to be operated with the foot; provided, however, that on automobiles not exceeding ten horsepower one brake will be sufficient.

Motorcycles shall be provided with at least one

horsepower one brake will be sufficient.

Motoreveles shall be provided with at least one brake, which may be operated by hand.

6. No motor vehicle tire shall be fitted with a chain when used upon gravel, macadam or other made roads, except upon natural dirt, asphalt, cobble. Relgium block or vitrified brick pavements; provided, however, that tires may be fitted with a chain when used upon roads covered with a coating of at least one inch of snow or ice.

7. Every motor vehicle must have devices to prevent excessive noise, annoving smoke and the escape of gas and steam, as well as the falling out of embers or residue from the fuel.

PART III.

Department of Motor Vehicle Registration and Regulation.

Regulation.

8. The Secretary of State shall forthwith organize in connection with the Department of State the deartment of motor vehicle registration and regulation. He shall provide suitable quarters for the same and the shall provide suitable quarters for the same summent of the proper enforcement of the provisions of this act. He shall approve all bills for diabursement of money under any of the provisions of this act, which shall be paid by the State Treasurer, upon the warrant of the Comptroller out of any appropriation of the provisions of the conficio commissioner of motor vehicles, and shall have personal charge and supervision of the confocusion of this act. The Commissioner of Motor Vehicles, who shall be chief clerk of the department of the provisions of this act. The Commissioner of Motor Vehicles, who shall be chief clerk of the department of the provisions of this act. The same the canabilities of all kinds of motor vehicles, and be canable to pass upon the efficiency of motor vehicles and the competency of motor vehicles and the competency of motor vehicles shall also appoint as many inspectors, not containing evidence of violations of this act, in obtaining evidence of violations and otherwise assisting in the enforcement of the act. The said inspectors shall be chosen with especial reference to their fitness for the work, and shall be required to submit themselves to such an examination as the Commissioner of Motor vehicles shall organize the inspector force with the chief inspector as the same and the competence of the department, or for any other cause. He shall fix the compensation of the inspector force with the chief inspector force with the compensation of the subsector force as shall appear desired the providence of the same and the compensation of the subsector force as shall appear desired by the compensation of the subsector force as shall appear desired by the compensation of the comp

proper person to be granted such a license; and the said commissioner shall have power to grant a registration certificate to the owner of any motor vehicle, application for reastration having properly been made and the fee therefor paid, and the vehicle being of a type that complies with the requirements of this act. But it shall be lawful for the said commissioner of motor vehicles to refuse registration to any vehicle that, in his estimation, is not a proper vehicle to be used upon public roads and highways of this State.

12. The commissioner of motor vehicles shall have such power and duties as are in this act given and imposed, and shall collect such data with respect to the proper restrictions to be laid upon motor vehicles, and the use thereof upon the public roads, turnpikes and thoroughfares, as shall seem to be for the public good, and under the direction of the Secretary of State shall report to each Lerislature the operations of his office for the year ending on the next preceding thirty-first day of December. It shall be his duty to attend to the enforcement of the provisions of this act.

13. The commissioner of motor vehicles shall keep a record of all his official acts, and shall preserve copies of all decisions, rules and orders made by him, and shall adopt an official seal. Copies of any paper or papers filed in his office, may be authenticated under said seal, and when so authenticated shall be evidence equally with and in like manner as the originals, and said commissioner sha. be empowered to communicate with the police departments and peace officers in the State for the purpose of and with the object of the roroper enforcement of this act.

14. Motor vehicle inspectors may be appointed, as provided in section nine of this act, and shall be presented with a badge indicative of their office, and when wearing such badge on the left breast of the outermost garment shall have power to stop any motor vehicle and examine the same to see that it complies with the requirements of this act, and sha

PART IV

The Operation of Motor Vehicles.

PART IV.

The Operation of Motor Vehicles.

15. No person shall drive a motor vehicle, the owner of which vehicle shall not have comolied with the provisions of this act concerning the proper registration and identification of the same; nor shall any person drive a motor vehicle which shall display on the front or back thereof a fictitious number, or a number other than that designated for such motor vehicle.

This section shall not apply to the owners or drivers of automobiles licensed pursuant to subdivision three of section sixteen of this act, but such automobiles licensed under said section shall at all times display on the back thereof the registration number of said automobile under the laws of the State in which the business of the owner shall be conducted, as provided in the said section, and no other number shall be required or shall be displayed upon the said automobile.

16. (1) Every resident of this State and every non-resident, whose automobile shall be driven in this State, shall, before using such vehicle on the public highways, register the same, and no motor vehicle shall be driven unless so registered. Every registration shall expire and the certificate thereof become void on the thirty-first of December of each year; provided, it may be lawful for any automobile duvergistered, to operate under said registration certificate. Such registration shall be made in the following manner: A statement in writing shall be made to the Commissioner of Motor Vehicles, or his lawful agent, containing the name and address of such owner, together with a brief description of the character of such automobile, including the name of the maker and the manufacturer's number, and the rated horse-power. The applicant shall pay the Commissioner of Motor Vehicles for each registration in the rated horse-power. The applicant shall pay the Commissioner of three dollars for automobiles of the first class; five dollars for the second class; and ten dollars for the third class. Automobiles of the horse-power or more of th

served on such owner within this State; the service of such process shall be made by teaving a copy of the same in the office of the Secretary of State with a service fee of two dollars to be taxed on the plaintiff's costs of suit. Said Commissioner of Motor Vehicles shall forthwith notify such owner of such service by letter directed to him at the post office address stated in his application. Upon any and every transfer of a registered automobile by the owner thereof, in whose name the same is registered, the said registration and certificate thereof shall forthwith be and become void; but the same may be validated by the endorsement of the Commissioner of Motor Vehicles, the purchaser having made written application therefor and paid a transfer fee of one dollar.

(2) Every resident who is the owner of a motorcycle, and every non-resident whose motorcycle shall be driven in this State, shall pay an annual registration or license fee of two dollars for such motorcycle, which shall include the right of such person to drive such motorcycle within this State without an examination of his ability to run a motorcycle, unless such an examination be required by the Commissioner of Motor Vehicles; and such owner shall be given a registration certificate, in which shall be designated the proper registration number, and such certificate shall expire on the thirty-first of December of each year, unless revoked by the Commissioner of Motor Vehicles, or as otherwise provided by this act.

designated the proper registration number; and such certificate shall expire on the thirty-first of December of each year, unless revoked by the Commissioner of Motor Vehicles, or as otherwise provided by this act.

(3) Every person or corporation regularly engaged in the business of carrying passengers for hire by means of automobiles, which business shall be conducted in a State adjoining the State of New Jersey, and the conduct of which business shall require such automobile to enter the State of New Jersey for said purposes shall make application, which applicant be a corporation, by an officer of the said corporation, and shall specify the number of automobiles which shall be operated in connection with the said business, the type and motive power of each, and the registration number of each under the laws of the adjoining State in which said business shall be connected, the Commissioner of Motor Vehicles shall issue to the said applicant, upon the payment of a fee of one hundred dollars, a registration certificate, which shall have endorsed thereon the type and batter egistration haber of matching the said applicant, upon the payment of a fee of one hundred dollars, a registration certificate, which shall have endorsed thereon the type and batter egistration alone to the said applicant, upon the point of entry in the State; provided, however, that not more than fifteen of the said automobiles to be operated within the State of New Jersey at any one time, and that no automobile shall be included under the provisions of such registration certificate unless the same is duly registered and licensed under the laws of the State in which such business is being conducted.

Perry manufacturer of or dealer in automobiles within this State instead of registerine each business within this State instead of registerine each business is being conducted.

Perry manufacturer of or dealer in automobiles within this State instead of registerine each business is being conducted by the manufacturer or dealer, as the case may

of drivers' licenses. Those authorizing the licensee to drive cars of less than thirty horsepower shall be

of the first class, and those authorizing the licensee to drive cars of thirty and greater horsepower, shall be of the second class. The annual license fee to be charged shall be two dollars for drivers of the first class, and four dollars for drivers of the second class. If an automobile has more than one rating of horsepower, all fees shall be reckoned at the highest rating. Provided, however, that the Commissioner of Motor Vehicles shall, upon the application of any person who or corporation which shall have complied with the provisions of sub-division three of section sixteen of this act, issue to the said person or corporation a sufficient number of special drivers' certificates, which shall have endorsed thereon the registration number under the laws of the adjoining State in which the business of the said applicant included in and covered by any license certificate issued pursuant to said sub-division three of section sixteen of this act, and which, when duly countersigned by a special agent appointed for that purpose by the said Commissioner of Motor Vehicles pursuant to the provisions of section ten of this act, shall authorize and permit the person to whom the same is issued to operate any of the automobiles registered under the laws of such adjoining State, the registration numbers of which shall appear endorsed upon the said certificate, and no others within the State of New Jersey, for a period of not to exceed twenty-four hours at any one time. Such driver shall at all times when operating any of the said vehicles within the State of New Jersey, the part of the said driver and the preceding provisions of this section shall not be applicable to him.

18. Each license to drive an automobile shall specify the maximum horsepower of the automobile allowed to be driven thereunder, and shall, have endorsed thereon in the proper handwriting of the licensee the name of said licensee. And said licensee when thereupon requested by any motor vihicle inspector or magistrate, while in the performance of the dut

e. No intoxicated person shall drive a motor yehicle.

20. No person shall drive a motor vehicle without the consent of the owner.

PART V.

Identification Marks of Motor Vehicles.

Identification Marks of Motor Vehicles.

21. The owner of every automobile which shall be driven on the public highways of this State shall display on the front and rear of such vehicle, not less than fifteen inches or more than thirty-six inches from the ground an identification mark to be furnished by the motor vehicle department; provided that the said motor vehicle department; provided that the said motor vehicle department shall not be required to furnish such identification mark to any motor vehicle already registered, prior to Iune first; and such motor vehicle so registered shall be permitted to display any identification mark lawful at the time of the passage of this act prior to said June first. Said identification mark shall contain the number of the registration certificate of said vehicle in stroke of not less than four inches in height with a stroke of not less than four inches in height with a stroke of such design as shall be prescribed by the Commissioner of Motor Vehicles. On the tag shall be, in smaller characters, the manufacturer's number of the car, certified by the Commissioner of Motor Vehicles. The identification marks of vehicles shall be either of metal or leather, sufficiently enduring to be plainly legible under all atmospheric conditions for at least one year. Motorcycles shall also display such identification marks on the front and side thereof as the Commossioner of Motor Vehicles shall prescribe. All identification marks shall be kept clear and distinct and free from rease, dust, or other blurring matter, so as to be plainly visible at all times during daylight and at night.

PART VI.

Use of Roads and Highways,

Use of Roads and Highways.

22. (1) Drivers of motor vehicles, whether of burthen or of pleasure, using any of the turnpikes or oublic roads in this State, when met by another motor vehicle, or by a carriage, sleigh, or sled, shall keep to the right, and when overtaken by another motor vehicle, carriage, sleigh or sled they shall likewise keep to the right, so as in both cases to permit such motor vehicle, carriage, sleigh or sled, either met or overtaken, to pass uninterrupted.

(2) No owner or purchaser or driver of a motor vehicle who shall have complied with the requirements and provisions of this act shall be required to obtain any other license or permit to use or operate the same, nor shall such owner or purchaser or driver be excluded or prohibited from or limited in the free use thereof, nor limited as to speed upon adypublic street, avenue, road turnpike, driveway, parkway or other public place, at any time, when the same is or may hereafter be opened to the use of perquired to comply with other provisions or conditions as to the use of said motor vehicle, except as in this section contained shall be construed to apply to or include any speedway created and maintained in pursuance of an act of the Legislature of the State of New Iersey entitled "An act to provide for the construction and maintained in pursuance of the Legislature of the State of New Iersey entitled "An act to provide for the construction and maintained in pursuance of speedway created and maintained in pursuance of an act of the Legislature of the State of New Iersey entitled "An act to provide for the construction and maintained in pursuance of speedway created and maintained in pursuance of an act of the Legislature of the State of New Iersey entitled "An act to provide for the construction and maintained in pursuance of an act of the Legislature of the State of the

ties of this State," approved March nineteenth, one thousand nine hundred and two; nor to any parks or parkways created and maintained in accordance with an act of the Legislature of the State of New Jersey entitled "An act to establish public parks in the counties of this State and to provide for the acquirement, improvement and regulation of the same," approved March twentieth, one thousand nine hundred and one. No city, town, township, borough or other municipality shall have power to make any ordinance, by-law or resolution limiting or restricting the use or speed of motor vehicles, and no ordinance, by-law or resolution heretofore or hereafter made by any city, town, township, borough or other municipal or local authority by whatever name known or designated in respect to or limiting the use or speed of motor vehicles shall have any force, effect or validity.

(3) No person shall drive a motor vehicle upon any public street, public highway, public road, public parkway, turnpike or public driveway in this State in a race or on a bet or wager.

(4) Every driver of a motor vehicle, after knowingly causing an accident by collision or otherwise knowingly injuring any person, horse, or vehicle shall forthwith bring his motor vehicle to a full stop return to the scene of accident and give to any proper person demanding the same his name, the number of his driver's license and the registration number of the motor vehicle, and the names and residences of each and every male occupant of said motor vehicle.

PART VII.

Provisions Concerning Safety of Traffic.

PART VII.

Provisions Concerning Safety of Traffic.

residences of each and every male occupant of said motor vehicle.

PART VII.

Provisions Concerning Safety of Traffic.

23. The following rates of speed may be maintained, but shall not be exceeded, upon any public street, public road or turnpike, public park or parkway, or public driveway, or public highway, in this State by anyone driving a motor vehicle.

(1) A speed of one mile in seven minutes upon the sharp curves of a street or highway or when turning a corner, and a speed of one mile in four minutes at the junction or intersection of a prominent cross-road where such a street, road or highway passes through the open country. The term "open country" meaning where houses are an average more than one hundred feet apart.

(2) A speed of one mile in five minutes where such street or highway passes through the built-up portion of a city, town, township, borough or village where the houses are on an average less than one hundred feet of any horse or other beast of draught of our min in four minutes within two hundred feet of any horse or other beast of draught of our drugen upon the same street or highway; provided, however, that such speed not exceeding twenty miles per hour, shall be lawful in the open country as may be necessary in order to pass a vehicle traveling in the same direction, but the speed shall be diminished forthwith if necessary to comply with the provisions of this act.

(4) Elsewhere and except as otherwise provided in subdivisions one, two and three of this section a speed of one mile in three minutes; provided, however, that nothing in this section contained shall permit any person to drive a motor vehicle at any speed greater than is reasonable, having regard to the traffic and use of highways, or so as to endanger the life or limb or to injure the property of any speed of one mile in three minutes; provided, however, that the foregoing provisions concerning the speed of motor vehicles shall not apply to any speedway built and maintained for the exclusive use of motor vehicles of motor v

Proceedings.

Proceedings.

26. (1) A complaint having been made in writing and duly verified, that any person has violated any of the provisions of this act, any magistrate of the county, or recorder or police magistrate of any municipality, in which the offense is committed may, within thirty days after the commission of said offense, issue either a summons or a warrant directed to any constable, police officer, the inspector of motor vehicles or the commissioner of motor vehicles of this State, for the appearance or arrest of the

person so charged; and the magistrate shall state what section or provision of this act has been violated by the defendant, and the time, place and nature of said voletion, and upon the return of said summons or warrant the said magistrate tendine the guilt or innocense of such person, and upon coviction, may impose upon the person so convicted the penalty, by this act prescribed, together with the costs of prosecution for such offense.

(2) Such magistrate, upon receiving complaint in convenient of this act by any corporation, is hereby authorized and required to issue a summons directed to any constable, police officer the inspector of motor vehicles, or the commissioner of motor vehicles, of this State, requiring such corporation to be and manned, to answer to said complaint, which said summons shal be served on the president, vice-president, secretary, superintendent or manager or such corporation, or the agent upon whom other process against it may be served, at least five days before the time of appearance mentioned therein, and thidviduals, except where a different procedure is provided by this act.

27. Any hearing to be held pursuant to this act shall, in the request of the defendant, be adjourned for a period not exceeding thirty days from the restability of the magistrate to detain the defendant in safe custody, unless he shall make a cash deposit or enter into a bond to the State of New State of the said of any arrest without warrant, as the case may be, but in such cash stable be the duty of the magistrate to detain the defendant in safe custody, unless he shall make a surely, to or in an amount not exceeding five hundred dollars, conditioned for his appearance on the large of the said sposed of; and such bond, if forfeited, may be prosecuted by the commissioner of motor well-desi and venture the provisions of section thirty-seven of his act; provided, however, that in lieu of said bond or cash deposit or enter into a bond to the State of New Justice in the provision of section thirty-seven of this

defendant.

30. Proceedings under this act may be instituted on any day of the week, and the institution of such proceedings on Sunday shall be no bar to the successful prosecution of the same; and any process served on Sunday shall be as valid as if served on any other day of the week.

THE MOTOR WORLD

31. All proceedings for the violation of the provisions of this act shall be entitled and shall run in the name of the State of New Jersey, with the commissioner of motor vehicles or a motor vehicle inspector, or a police officer, or a constable, or such other person as shall by complaint institute the proceedings as prosecutor; and any magistrate may, at his discretion, refuse to issue a warrant on the complaint of any person other than the commissioner of motor vehicles or a motor vehicle inspector, until a sufficient bond to secure costs shall have been executed and delivered to the said magistrate.

32. (1) Any constable, or police officer, or motor vehicle inspector or the commissioner of motor vehicles is hereby authorized to arrest without warrant any person violating in the presence of such constable, or police officer or motor vehicle inspector or the commissioner of motor vehicles any of the provisions of this act, and to bring the defendant before any magistrate of the county where such offense is committed. The person so offending shall be detained in the office of the magistrate until the officer making such arrest shall make oath or affirmation, which he shall do forthwith, declaring that the person under arrest has violated one or more of the provisions of this act, and specifying the provision or provisions violated, whereupon said magistrate shall issue a warrant returnable forthwith, and the said magistrate shall proceed summarily to hear or postpone the case as provided in sections twenty-six and twenty-seven of this act.

(2) Any person arrested for a violation of any of the provisions of this act shall, upon demanding of the magistrate hearing the complaint against said person, produce his license for inspection, and if said person shall fail to produce his license, or to give a satisfactory excuse for its non-production, he shall, is addition to any other penalties imposed by said magistrate, be subject to a fine of not more than twenty-five dollars.

satisfactory excuse for its non-production, he shall, in addition to any other penalties imposed by said magistrate, be subject to a fine of not more than twenty-five dollars.

33. A summons or warrant issued by any magistrate in accordance with the provisions of this act shall be valid throughout the State, and any officer who has the power to serve the said summons, or to serve said warrant and make arrests thereon in the county where the same shall have been issued, shall have like power to serve said summons and to serve said warrant and make arrest thereon in any of the several counties of the State. If any person shall be arrested for a violation committed in the county other than that in which the arrest shall take place, the person so arrested may demand to be taken before a magistrate of the county in which the arrest may have been made for the purpose of making a cash deposit or of entering into a recognizance with sufficient surety; whereupon the officer serving the said warrant shall take the person so apprehended before a magistrate of the county in which the arrest shall have been made, who shall thereupon fix a day for the matter to be heard before the magistrate issuing the said warrant, and shall take from the person apprehended a cash deposit or recognizance to the State of New Jersey with sufficient surety or sureties for the appearance of the said person at the time and nlace designated in accordance with the provisions of section twenty-seven of this act; the cash deposit or recognizance so taken shall be returned to the magistrate issuing the warrant, to be retained and disposed of by him as by this act provided.

34. The same fees shall be allowed the magistrate and officers making an arrest or serving a summons in proceedings under this act as are allowed for like services in the small cause court and shall be paid by the defendant if the defendant be found not guilty of the charge or charges laid against him, then the costs shall be repaid to said defendant as hereinbefore provided. If

Punishments and Penalties.

PART IX.

Punishments and Penalties.

35. Any person who shall be convicted of violating the provisions of sections fifteen and twenty-one of this act shall be subject to a fine not exceeding one hundred dollars; in default of the payment of such fine there shall be imposed an imprisonment in the county jail for a period not exceeding ten days; provided, that any offender who shall be convicted of a second offense of the same violation may be fined in double the amount herein prescribed for the first offense, and may in default of the payment thereof, be punished by imprisonment in the county jail for a period not exceeding twenty days; provided, further, that the penalties above prescribed shall not apply to the display of a fictitious number.

Any person convicted of displaying a fictitious number as prohibited by section fifteen, or of violating the provisions of section seventeen, nineteen or twenty of this act, shall be subject to a fine not exceeding five hundred dollars, or to imprisonment in the county jail for a period not exceeding striv days.

Any nerson who shall be convicted of a violation of subdivision four of section twenty-two of this act, shall be subject to a fine not exceeding two hundred and fifty dollars, or to imprisonment in the county jail for a period not exceeding thirty days.

Any person who shall be convicted of a violation of section sixteen of this act shall be subject to a fine not exceeding two hundred and fifty dollars, or to imprisonment in the county jail for a period not exceeding thirty days.

Any person who shall be convicted of a violation of subdivision three of section twenty-two, or of section twenty-two, or of section twenty-three of this act, shall for the first offense be subject to a fine not exceeding one hundred dollars; in default of the payment of such fine there shall be imposed an imprisonment in the county jail for a period not exceeding ten days; provided, that any offender who shall be convicted of a second or any subsequent offense of the same violation may be fined in double the amount herein prescribed for the first offense, or imprisoned in the county jail for a period not exceeding twenty days, and in addition to such penalties the license of said offender shall be revoked; provided further, that nothing herein contained shall prevent a revocation of license for the first offense, or for the violation of any other provision of this act.

Any person who shall be convicted of violating any

Any person who shall be convicted of violating any of the following-named provisions of this act shall be subject to the penalties herein specified:

Of sections three, four or eighteen, a fine not exceeding ten dollars.

Of section six a fine not exceeding fifty dollars.
Of subdivision one of section twenty-two a fine not exceeding twenty-five dollars.

Of section six a fine not exceeding fifty dollars.

Of subdivision one of section twenty-two a fine not exceeding twenty-five dollars.

36. It shall be lawful for a magistrate before whom any hearing under this act shall be had, to revoke the license of any person to drive motor vehicles when such person shall have been guilty of such willful violation of the provisions of this act as shall in the discretion of the said magistrate justify such revocation, but an appeal of the matter to the Court of Common Pleas shall act as a stay upon said revocation, and the Court of Common Pleas upon the appeal of the said matter shall have the power to void the said revocation; and the commissioner of motor vehicles shall at all times have the power to validate a license that has been revoked, or to grant a new license to any person whose license to drive motor vehicles shall have been revoked.

It shall be lawful for the justice of the Supreme Court holding the circuit in each of the counties of this State, upon application made to him by a verified petition for that purpose by any nerson against whom a judgment or sentence for the violation of any of the provisions of this act shall have been rendered, who may desire to have the legality of his conviction reviewed or the reasonableness of the sentence or penalty imposed, to order the said complaint, process, proceedings, evidence and record of conviction to be forthwith brought before him, that the legality of such proceedings and sentence, or judgment, or the reasonableness of the sentence or penalty may be summarily reviewed and determined; and if such proceedings and sentence or judgment shall thereupon be found to be illegal, or the sentence or penalty be unreasonable, forthwith to set aside the same and to order the remission or reduction of any fine and costs that may have been imposed or the discharge of any offender from custody.

PART X.

Miscellaneous

PART X. Miscellaneous.

PART X.

Miscellaneous.

37. Moneys received in accordance with the provisions of this act, whether from fines, penalties, registration fees, license tees, or otherwise, shall be accounted for and forwarded to the Commissioner of Motor Vehicles and by him paid over to the Treasurer of the State of New Jersey, to be appropriated annually to the Commissioner of Public Roads, to be used as a fund for the repair of the improved roads throughout the State, whether they had been originally built by State aid or not, and to be by the said Commissioner, apportioned once each year among the several counties of this State according to the mileage of improved roads in each county, the share apportioned each county to be used for the repair of improved roads in that county under the direction of the Commissioner of Public Roads or his authorized representatives, and to be vaid in the same manner as State funds are now paid for the improvement of public roads. The term : improved roads" as used in this section shall not include streets paved with cobble stones, Belgium block or asphalt.

38. The Commissioner of Public Roads shall be authorized and full power and authority are hereby given to him to have erected at such points throughout the State as to him shall seem necessary, cautionary warnings of dangerous crossings, steep declivities or other irregularities or perils of the roadway, at a cost, however, not to exceed in the aggregate one thousand dollars per annum.

39. When any motor vehicle shall have been deposited under this act in lieu of bond, the said motor vehicle shall be held the property of the State of New Jersey, subject to the same conditions as would govern the bond under like circumstances, and may be redeemed by the person depositing the same upon delivery of the requisite bond or upon paying such fine and subfitting to such penalty as may be imposed; and unless the motor vehicle so deposited in lieu of bond shall be redeemed within ten days next following the date of the final determination of the matt

BLACK LIST POSTED AT FERRIES

Long Island Railroad Bars Automobilists for Violating Rules—Prominent Owners Under the Ban.

Failure to obey the rules of the Long Island Railroad Co. with reference to automobiles entering and leaving the ferryboats that ply across the East river between New York and Long Island City, has resulted in a black list by the company and 11 cars hereafter will be denied transportation over its ferries. The ban has been placed upon these cars because of the failure of the drivers to obey the rule which requires that the motor of a car shall be stopped after the car has been driven upon the ferry boat and shall not be started until the boat is tied fast to the slip. The ambitiousness of some chauffeurs to "crank up" when the boats are in mid-stream, so as to not lose a minute's time when the other side is reached, is what has caused the Long Island Railroad company to assert its rights.

The fact that the company has black-listed 11 automobiles from the use of the ferries became known on Sunday, when users of the ferries were startled by the appearance of a huge blackboard over the entrance at the Long Island City terminal. The big white letters at the top of the blackboard told that "The following automobiles have been refused transportation over these ferries." Below were chalked the numbers of 11 cars, as follows:

"36,335 N. Y., 49,145 N. Y., 49,503 N. Y., 36,328 N. Y., 51,659 N. Y., 50,000 N. Y., 27,247 N. Y., 21,227 N. J., 40,422 N. Y., 36,360 N. Y., and 34,963 N. Y.

That the Long Island Railroad company does not mean to "play favorites" is evident. Among the published list of cars that have been refused transportation are those belonging to William K. Vanderbilt, Jr., William D. Sloane, Morris Untermeyer. and Alden L. McMurtry. The others are: Lawrence Gourlie, Dr. Calvin Thayer Adams, Night Setrive Co., Lozier Motor Co., Frederick H. Tucker, Jr., H. A. Pharmson, and Thomas A. Smith.

Below the blackboard flared a big sign which read:

AUTOMOBILES!

MOTOR MUST BE STOPPED

IMMEDIATELY AFTER
BEING LOCATED ON FERRYBOATS, AND MUST NOT BE
STARTED AGAIN UNTIL BOAT IS
FAST IN SLIP.
FAILURE TO OBSERVE
THIS RULE WILL RESULT IN
REFUSAL OF TRANSPORTATION
ON FERRIES.
LONG ISLAND R. R.

That the action taken by the Long Isl-

and Railroad Co. is not without reason cannot be denied. Though not of frequent occurrence, there have been accidents resulting from starting motors before the boats are made fast to the slip, and it is to guard against a recurrence of this that the company has found it necessary to stand upon its rights, so to speak.

In explanation of the action taken by the railroad company, President Ralph C. Peters caused this statement to be issued:

"We have been forced to take this step in the interest of public safety. Years ago a law was enacted by Congress prohibiting motor vehicles from entering upon ferries under their own power. Later that measure was changed so that vehicles driven by their own power could be propelled aboard ferries and similar boats under that power. Until that amendment was enacted they had to be pushed on board by hand. The law, however, requires that motors must be stopped immediately the vehicle is located and not started until the ferry is fast in its slip again after the trip. Chauffeurs have proved obstinate and refused to obey that law, preferring to let their engines chug away. We do not intend to stand for that any longer.

"Last fall a car on which the engine had not been stopped suddenly shot ahead and knocked three or four persons into the river. Again, there is more danger of an explosion when motors are running. Such an explosion might set fire to the ferry and cause a great loss of life. We don't wish to interfere with traffic or to put any one to inconvenience, but the law must be respected. Everybody will be treated exactly alike, but we intend to break up the practice of automobilists not stopping motors once they have their cars on board and of starting them before ferries are in the slips again."

Buffalo Enforcing "Drip Pan Ordinance."

Enforcement of the new "drip pan ordinance" began in Buffalo on Monday, 4th inst. The first offenders charged with neglecting to provide their automobiles with pans to prevent oil from dripping on the pavements got off with light penalties. There were four of them arraigned before Judge Hodson, in the Municipal Court, and all pleaded guilty, but averred in extensation of their offense that they had ordered pans which had not been delivered at the time. The court mulcted each defendant only the amount of costs, \$1.50 for each, but intimated that the cases would not constitute precedents.

Bullets for the Tires of Scorchers.

Chief of Police Metzger, of Indianapolis, is on the war path. He has instructed Motorcycle Patrolman Gibney to use his revolver on the tires of any automobiles whose drivers refuse to stop when ordered. Metzger has announced that he will make every effort to have second offenders fined the limit of \$200 and costs.

SIGNS THAT "GO BY CONTRARIES"

Some in Somerville that Don't Say What They Mean, nor Mean What They Say.

· Somerville is one of several cities, considerable in size, that cluster around Boston, constituting the fellies of the big metropolitan "wheel" of which Boston is the "Hub." It has many miles of good streets, with such a variety of stiff hills and long level stretches as to lead speed loving motorists into temptation. Among its residents is C. A. Kenniston, who has a storehouse at 174 Walnut street. In front of it he has a huge sign that motorists cannot fail to see, no matter how fast they may be moting from the Mystic boulevard across Broadway and up the Walnut street hill, one of the stiffest in the city, by the way, and a good one for the climber. The sign bears the legend:

AUTO RACING
EVERY DAY
RIGHT BY HERE
MILE
A MINNIT
GRAND OLD STAND

"People here in America, and especially automobilists, do just the opposite of what they are told," Kenniston explained to a curious caller, who had noticed the size of the sign and the excellent work in the big black lettering. "They don't mind the signs on the boulevard telling them the speed limit is 15 miles an hour. They go by here a mile a m-i-n-u-t-e-, not a 'minnit' as my sign says. And, by gosh, that's dangerous.

"With all the automobilists here, it's getting as bad as down Maine. I don't dare let my daughter go out driving alone. Down Maine the farmers don't dare let their wives and daughters go down to the village store alone for fear of these automobilists; why, with their big goggle lamps they'd scare any one to death on a dark night."

And so Mr. Kenniston puts up a sign telling of the beauties of his place of business as a grandstand for witnessing the automobile racing. He hopes the drivers will do just the opposite of what the sign suggests.

Kenniston is a believer in signs. He has them all around his storehouse and yard. The most of them warn people to do just what Kenniston doesn't want them to do.

One of Kenniston's signs, for example, reads:

"Hit it and pull it down, as Samson did the temple."

Despite the fact that every driver of a wagon sees the sign in large letters, the pillar on which the suggestion is thus plainly set forth has not been hit once, even softly.

Note the straight-line Body—the hall-mark of Quality.

MATHEMATICALLY EXACT

The Oakland car, in its completeness, in an assemblage of parts, every one of which has been studied and worked out in detail, the result being a matter of mathematical certainty.

There were no theories to advance, no experiments to be proved. Engineering skill and extended automobile experience were united to produce the simplest, most efficient and economical motor car possible. Price was not considered, for elimination of costly complexity and a proper understanding of the object in mind regulated that consideration.

Maximum of Power; Minimum of Parts

The Oakland car was designed to realize to the fullest extent the possibilities of the gasolene motor in its simplest and most economical form. This includes first cost, cost of maintenance, operation and long life. We honestly believe the Oakland will stand more hard, legitimate abuse with less attention than any other automobile, regardless of price.

Simplicity of Construction

The power plant is a two-cylinder vertical engine, perfectly balanced, absolutely free from vibration, water cooled by the thermo-syphon, or gravity system (doing away with all gears, pumps, etc.), a transmission that the planetary system ought to be, but isn't, shaft drive with all bearings of more generous surface than provided for in most larger cars, and delivers TWENTY HORSEPOWER AT THE DRIVING WHEELS. Lubrication is positive and unfailing. Engine design insures perfect ignition. Carburetion is constant at all speeds. Semi-elliptic front and full elliptic rear springs provide luxurious riding qualities.

The Oakland is making friends by "making good."

Runabout, \$1300 Tourabout, \$1350 Touring Car, \$1350

The Week's Patents.

12,754. Reissue. Tire Cover. William A. Allen, New York, N. Y. Filed Jan. 17, 1908. Serial No. 411,375. Original No. 828,701, dated Aug. 14, 1906, Serial No. 298,880.

1. A covering for vehicle tires, constructed of a weather proof material consisting of connected substantially parallel strips, one for the inner face of the tire, one for each of the side faces of the same, one for the tread, and a flap connected with the inner facing strip, and adapted for lapping engagement with one of the side strips, one only of the parts thus lapped being transversely divided, and one portion of the flap being arranged to extend beneath said side strip and the other portion outside said side strip, and means for securing the flap to the side strip with which it engages.

880,526. Vehicle. Henry S. Hele-Shaw, London, England. Filed June 27, 1907. Serial No. 381,161.

1. The combination with a vehicle or transporter of a carrier rotatable in a "horizontal plane," feet supported by said carrier and movable relatively to the carrier to engage the ground and to raise them clear of the ground.

880,587. Apparatus for Manufacturing Pneumatic Tires. Thomas Sloper, Devizes, England. Filed June 27, 1907. Serial No. 381,164.

1. In a "former" employed in building up a tire fabric, means for holding a plurality of anchoring devices for the fabric, in such a manner that they may be released from the "former" without disturbing their relation to the fabric, substantially as set forth.

880,664. Friction Clutch. William J. Hilliard, Elmira, N. Y. Filed Jan. 15, 1907. Serial No. 352,418.

1. The combination in a friction clutch, of a clutch member, a friction surface thereon, a longitudinally movable section on said second clutch member, a friction surface thereon, screw mechanism for moving said sections of the second member toward and away from the friction surface on the first named clutch member, and a sleeve rotatable with the shaft and non-rotatable with relation to the screw mechanism for operating said screw mechanism, substantially as set forth.

880,704. Gas Engine. Marshall L. Wood, Montpelier, Vt. Filed Feb. 5, 1907. Serial No. 355,782.

1. In an internal combustion or explosive engine, the combination of a plurality of cylinders, and a piston in each cylinder which supplies the fuel-charge to another of said cylinders, said piston having a hollow interior in which the fuel-charge is received and compressed.

880,732. Driving Mechanism. Edmund R. Halsey. South Orange, N. J. Filed Feb. 16, 1907. Serial No. 357,702.

16, 1907. Serial No. 357,702.

1. In a friction drive, the combination, with an axle which is to be driven, of a friction device connected with said axle, a driving shaft, a transmission shaft operated from said driving shaft, a friction disc at the opposite end of the transmission shaft, and means for producing a longitudinal reciprocatory movement of the transmission shaft to bring the friction disc of said shaft in engagement with the friction device of the axle, and mechanism for producing a lateral reciprocatory movement of the transmission shaft, comprising a channeled truss or guide bar, a slide upon said bar, a bearing on said slide in which said trans-

mission shaft is revolubly arranged, and means for moving said slide back and forth upon said guide bar, substantially as and for the purposes set forth.

880,739. Automobile. Manander M. Johnson, Clay Center, Neb. Filed Nov. 30, 1907. Serial No. 404,603.

1. In automobile construction the combination of running gear, an air receiver supported thereon and having an open end arranged toward the front end of the machine, a motor, means for conveying air from the air receiver to different parts of the motor, and means for variably controling the relative quantities of air passing to said parts.

880,759. Motor Vehicle. George G. Schroeder, Washington, D. C., assignor to Farm Motor Company a Corporation of South Dakota. Filed June 20, 1906. Serial No. 322,563.

1. A motor vehicle comprising a body provided with traction wheels, an independent drive shaft for each wheel, gearing for imparting forward and reverse rotations to each drive shaft and each adapted to independently connect its respective shaft with either of its respective gearings.

880,815. Stored Pressure Motor Starting Device. Edward P. Noyes, Winchester, Mass., assignor to Charles F. Brown, trustee, Reading, Mass. Filed Dec. 28, 1906. Serial No. 349.822.

1. In a compound motor system, the combination of a high presure internal combustion prime motor adapted to drive the external load indirectly through the medium of exhaust pressure fluid, an independently running low pressure engine operated by the pressure of the exhaust from said prime motor, means for storing the pressure fluid suplied by said prime motor and for admitting it to the low pressure engine, and means for temporarily connecting the low pressure engine to drive the prime motor.

880,856. Reversible and Variable Speed Power Transmitting Device. Joseph Bartosik and Peter Krummel, Pittsburg, Pa. Filed May 17, 1906. Serial No. 317,283.

1. In combination aligning shafts, discs on the adjacent ends of the shafts, the opposed faces of the discs being conical, a drive shaft passing between the discs, friction rolls on the drive shaft movable on the shaft, a frame movable on each of the rolls, a bar secured to each frame and slidable through the remaining frame, and means engaging the bars to impart movement thereto.

880,884. Spring for Vehicles. Leverett C. Haynes, Boston, Mass. Filed Oct. 3, 1906. Serial No. 337,308.

Exclusive Features of Solar Lamps

(2) Interchangeable Parts

A most important point for the owner or user to consider in purchasing a motor lamp is the matter of interchangeable parts. The entire construction of Solar Lamps by tools and jigs assure the user absolutely of interchangeable parts. In the event of accident the matter of repair is greatly simplified, and naturally less expensive than complete replacement, which is often necessary when the lamp parts are not interchangeable.

This important detail and all others explained fully in our new 1908 catalog. Write for copy.

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

Use Columbia Lock Nuts

COLUMBIA NUT & BOLT CO., Inc., Bridgeport, Conn.

WHITE WINS

Double Victory in Harrisburg Endurance Run

A 30 horse-power White Steamer was the only touring car to make a perfect score in the 32_J-mile endurance run of the Motor Club of Harrisburg, held May 4 and 5. The White was awarded the principal trophy, the Board of Trade Cup, and also the *Patriot* Cup for which four cars, including the White, tied in last year's contest. Three of last year's successful drivers competed with the same makes of cars in this year's contest and their relative performances decided the award of the 1907 trophy, the White, of course, being the winner.

The contest was run over the rough and hilly roads of eastern Pennsylvania. A 20-mile-an-hour schedule prevailed, with checking stations at intervals of approximately 30 miles. Each car carried an observer, and, in addition, all working parts were sealed. At the conclusion of the run the cars were critically examined by a committee of well known experts.

That the single White entry should have made the only perfect score in the touring car division is significant of the superior reliability and strength of construction of the White. The results of the Harrisburg contest, it should be further pointed out, were the same as in the memorable contest of the Quaker City Motor Club on January 1, 2 and 5, and in last year's struggle for the Hower Trophy, in that the single White entry proved triumphant over a large number of the leading gasolene cars.

NEW SAN FRANCISCO-LOS ANGELES RECORD

A 30 horse-power White Steamer set up a new record from San Francisco to Los Angeles on April 28, 1908, covering the 478-mile mountainous journey in 17 hours and 17 minutes, thus cutting 56 minutes from the former record which had stood for nearly two years.

PERFECT SCORE IN DETROIT ENDURANCE RUN

The single White Steamer entered in the three-day, 419-mile endurance run of the Detroit Dealers' Association, held on April 29-30 and May 1, made the usual White performance—a perfect score.

PERFECT SCORE IN BALTIMORE "SEALED MECHANISM" CONTEST

The single White Steamer entered in the 147-mile "sealed mechanism" contest of the Automobile Club of Maryland, held May 2, made the usual White performance—a perfect score.

Here's a Record Breaker!

DURING the months of January, February, March and April, 1908, one dealer in the middle west sold Rambler automobiles to the value of \$127,325.93.

There is a big opportunity for substantial business men to add greatly to the volume of their business by selling Rambler automobiles.

More business of all kinds is being done in the middle and southwest to-day than in any other section.

Right now St. Louis, perhaps the choicest location of all, is open for the sale of Rambler automobiles.

The Rambler sales agency proposition is reciprocal and is bound to interest any wideawake business man.

Large Sales

make it possible for us to import THE CELEBRATED BRAMPTON CHAINS from ENGLAND (paying freight and duty), and sell them at the same price at which the several other automobile chains are sold to manufacturers, jobbers,

THE BRAMPTON MOTOR CHAIN

All side plates on both sides on the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement.

THE BRAMPTON CHAIN is made of helf-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material—self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMP-TON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size—as follows:

CHAINS TO FIT AMERICAN CARS

Your 1908 Car

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

Agents wanted in unoccupied territory. Catalog on request.

We are Sole American Agents for BRAMPTON CHAINS, and they cannot be bought from anyone else except through our Agents.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches: leaves the automobile with its original new lustre, without being sticky or greasy. Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all Automobile Dealers. Price 60 cents per bottle.

The Miller Automobile Jack

The Miller Automobile Jack is a quick acting, automatic lowering jack, designed especially for automobile use, and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. It is high-grade and one of the finest finished jacks on the market. We guarantee this jack for twelve months. The list price of the Miller lack \$3.50 each. We guarantee the Jack, \$3.50 each.

The Auto-Meter-

-Is Believed

Every big motor event that has taken place in the past three or four years has seen more Auto-Meters in evidence than all other makes of speed indicators combined.

In the Glidden Tours the number of Auto-Meters used by contestants doubled and tripled all other makes put to-gether.

In the New York-Paris Race the only speed indicator is a Warner on the Thomas car.

Nearly all the automobile manufacturers of the country use the Warner to test out their

cars before they leave the factory.

Two of the most successful makers are including the Warner as

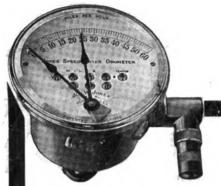

part of their regular equipment.

Aren't these facts father significant—don't they mean anything to

Send for our new book, "The Final Truth About Speed Indica-

CHICAGO MAY HAVE TWO SHOWS

Proposition for "Independent" Exhibition
Interests Local Automobile Club—
Two Locations Available.

Chicago is in a fair way to have two shows instead of one next winter. General Manager Alfred Reeves of the A. M. C. M. A., made overtures to the Chicago Automobile Club in regard to the matter of an "independent" show and the board of managers officially responded, by letter dated May 8, to the effect that "Barkis is willin" to receive further advances. Simultaneously, men in Chicago who are interested in the direction of giving the Windy City a show that will appeal to others than the Selden group of makers began to hunt for a suitable building for the show, keeping always in mind the adaptability of the Dexter Park Pavilion at the stockyards. They have discovered that the new Seventh Regiment armory on Wentworth avenue near Thirtythird street is an ideal structure for the show and doubtless will try to get an option on the building for the latter part of next January.

The regiment's new home is well under way and will be completed in plenty of time for the automobile show. It is admirably located and easily accessible by electric cars, the elevated railroad and the steam roads. There will be two large drill floors that will not only facilitate the aesthetic installation of machines, but afford a wide scope for decorative effect.

Sternbergh Wins on Appeal.

After sustaining two defeats, Herbert M. Sternbergh, formerly president of the Duryea Power Co., Reading, Pa., finally has obtained a reversal of judgment in the hard fought case which followed the appointment of a receiver for that company. When the company reached the bankruptey court, Sternbergh presented claims for \$14,000 for money advanced and sought to vote his

claims in the election of a trustee. In opposition it was contended that Sternbergh was really a debtor to the extent of \$25,000 for unpaid stock subscriptions, and therefore was not entitled to a vote. The referee sustained this argument and in turn was upheld by the court. Sternbergh appealed and this appeal has been decided in his favor by Judge Buffington, sitting in the United States Circuit Court for the Pennsylvania district. The effect of this decision will permit Sternbergh to participate in the distribution of the assets of the estate upon the basis of his claim, but will not disturb the trusteeship, which was not attacked in the appeal, as the estate is now practically wound up, the plants and assets having been sold; also he will not be compelled to face a suit by the trustee for the unpaid stock subscription which was held in abeyance pending the decision of the appeal.

R. Hale Smith Takes His Own Life.

R. Hale Smith, president and treasurer of the R. H. Smith Mfg. Co., Springfield, Mass., makers of the Springfield Motometer, committed suicide by shooting himself in the right temple on Tuesday night last, 12th inst. He was found unconscious by his brother shortly before 10 o'clock and expired an hour later. He had shot himself while seated at his desk in his office, after first telephoning his brother and a doctor requesting that they come at once because of "something important," and sending a note to his wife. To ill health and brooding over business worries are ascribed the cause of Mr. Smith's action. He was 63 years of age and a man of much prominence in Springfield, being, among other things, chairman of the Board of Public Works.

To Sell the Sager Productions.

The Motor Distribution Co., of New York City, which was incorporated this week with a capital of \$25,000, has taken the selling agency for Sager equalizing springs, cross chains and protection bumpers manufactured by the J. H. Sager Co., Rochester, N. Y.

MORRIS FINED \$100 FOR CONTEMPT

Manhattan Storage Man Violates Injunction and Rushmore Hales Him to

Court—Morris Blames Clerks.

Having obtained injunctions against the Manhattan Storage Co., the Manhattan Lamp Works, the General Automobile Supply Co., and the Manhattan Screw & Stamping Co., among others, restraining each and all of them from manufacturing or in any way dealing with "colorable imitations" of the Rushmore flarefront design, the Rushmore Dynamo Co. has been unusually active in pressing home their advantage.

Despite the injunctions, it is alleged that several of the defendants have continued to make or sell lamps of the sort and accordingly Rushmore had them cited for contempt of court.

The first of these cases to be tried involved Adolph Morris, of the firm of Morris & Grinberg, who do business as the Manhattan Storage Co. It was heard yesterday by Judge Hough, in the United States Circuit Court in New York, and resulted in a fine of \$100 being imposed on Morris. According to the evidence, Grinberg had escaped legal service. The marshal had been unable to locate him and Morris's lawyer stated that Grinberg "never goes to the Broadway store, being engaged in a manufacturing business in another part of the city."

Morris, who appears to have been "caught with the goods" admitted his guilt and made efforts to settle the case out of court. Rushmore himself had played the part of Sherlock Holmes, and calling at the Manhattan Storage Co.'s establishment had induced one of the salesmen to fit one of the infringing lamps to his automobile while a photographer in waiting took a picture of him while in the act. The court ruled however, that the photograph was not material proof.

Morris practically threw himself on the

mercy of the court. He pleaded that a serious accident to his three daughters had caused him to absent himself from his store for three weeks, and generally threw the blame on his clerks who manfully substantiated his every statement. Morris, they said, had given them strict orders to put the offending lamps in the cellar and not to sell or display them in any way. The fitting of one of the lamps to Rushmore's automobile was explained with exquisite gracefulness. The lamp "just happened" to be reposing on a shelf when Rushmore called, and it was solely to oblige a prospective customer that the salesman took it out of doors and attached it to his car that he might see "just how it looked," and not for the purpose of effecting a sale. It it had not been for the overzealousness of this clerk, there would have been no contempt, Morris's lawyer maintained. thought a \$10 fine would amply cover any contempt that had been shown. Rushmore's lawyer had not a great deal to say, while his opponent played so hard on the harp of human sympathy that Judge Hough at one stage of the proceedings, asked Rushmore's counsel: "Why are you so bloodthirsty?" the judge expressing the belief that "if an order of this court goes out branding this defendant as in contempt, it will affect him in his business relations." Earlier, however, the court declared himself less mercifully.

"I decline to believe," he then said, "that if strong and emphatic orders had been given to the clerks by Mr. Morris that the injunction would have been violated."

Trinidad a Good Possible Market.

According to the Canadian commercial agent at Port of Spain, Trinidad, an opening for motor cars exists in those islands. "This country is especially adapted for motor cars," he states, "having excellent roads for hundreds of miles. Very few cars have been imported, and those only by people who have been abroad and selected for themselves. The number of persons here who are in a position to drive their own vehicles is comparatively large, and if a handy, reliable, and fairly cheap machine were introduced there would be, I think, a good market for them, and the first one on the spot will get the advantage."

Mason to Make Addition to Factory.

With capital stock increased from \$50,000 to \$100,000, the Mason Motor Car Co., of Des Moines, Iowa, plans the building this summer of an extension to its plant. The addition will be 44x150 feet, and will house the painting, upholstering and assembling departments.

Elkhart Building a Cement Factory.

Work has been commenced on a twostory cement factory at Elkhart, Ind., for the Elkhart Motor Car Co. The building will be 40 by 120 feet and is expected to be completed in about 60 days.

The Week's Incorporations.

Norwalk, O.—New London & Norwalk Transportation Co., under Ohio laws, to establish an automobile passenger and freight service.

Jamaica, N. Y.—Jamaica Motor Car Co., under New York laws, with \$1,000 capital. Corporators—J. A. Jones, John Leonardi, F. B. Anderson.

Chicago, Ill.—American Puncture Proof Tire Co., under Illinois laws, with \$60,000 capital. Corporators—G. E. Divon, J. L. G. Dykes, H. S. Osborne.

Allenhurst, N. J.—Atlantic Coast Garage, under New Jersey laws, with \$125,000 capital. Corporators—W. F. Weed, J. F. Padelford, J. D. Brockway.

Camden, N. J.—Pennsylvania Taximeter Cab Co., under New Jersey laws, with \$50,000 capital. Corporators—J. C. Hinckle, W. C. Wilson, H. H. Voorhees, Camden, N. J.

Jersey City, N. J.—Taxi Motor Car Co. of Philadelphia, under New Jersey laws, with \$300,000 capital. Corporators— C. A. Cole, Hackensack; R. F. Tully, F. Vreeland. Jersey City, N. J.

Buffalo, N. Y.—Buffalo Sightseeing Co., under New York laws, with \$15,000 capital; to operate sightseeing automobiles. Corporators—Gibson Howard, Fred J. Weber, Henry G. Breed, Jr.

Camden, N. J.—Autobus Co., The, under New Jersey laws, with \$1,000,000 capital; automobiles, vehicles, motor cars, etc. Corporators—F. R. Hansell, W. F. Eidell, J. A. MacPeak, Camden, N. J.

Jersey City, N. J.—Sterling Vehicle Co., under New Jersey laws, with \$300.000 capital; to manufacture automobiles, motor boats, etc. Corporators—H. O. Coughlin, B. S. Mantz, L. H. Gunther, Jersey City, N. J.

Hoboken, N. J.—International Generator Co., under New Jersey laws, with \$100,000 capital; to manufacture engines, automobiles and motor boats. Corporators—J. E. Whiting, Willard P. Jessup, Frank C. Pringle.

New York City, N. Y.—American Zust Motor Co., under New York laws, with \$50,000 capital. Corporators—Walter F. Sykes and Walter F. Sykes, Jr., 85 Water street; L. Lawrence Weber, 1402 Broadway, New York City, N. Y.

Asbury Park, N. J.—Zacharias Garage Co., under New Jersey laws, with \$100,000 capital; to manufacture automobile vehicles and electric and other motors. Corporators—C. R. Zacharias, L. Hulit, Asbury Park; F. L. C. Martin, Plainfield, N. J.

New York City, N. Y.—Motor Distribution Co., under New York laws, with \$25,-000 capital. Corporators—Bennett Bishop, 54 West Fifty-fifth street; John F. Meader, 536 West 112th street; Edgar B. Bronson, 194 Riverside Drive, New York City, N. Y.

New York City, N. Y.—S. Healey Co., under New York laws, with \$20,000 capital; to manufacture motors. Corporators—Herbert

T. Jennings, 206 Broadway; James W. Mc-Cabe, 215 Pearl street; Sumner Healey, 652 West Fifty-first street, New York, N. Y.

Brooklyn, N. Y.—American Carburetor and Improvement Co., under New York laws, with \$25,000 capital. Corporators—Mathias Weiwoda, 1660 Bushwick Ave.; Fred W. Keller, 1814 Broadway; Henry Berliner, 859 St. John's place, Brooklyn, N. Y.

Buffalo, N. Y.—People's Auto Delivery Co., under New York laws, with \$100,000 capital; to transfer baggage and freight and manufacture automobiles, carriages, carts and motor vehicles. Corporators—David S. Ferris, Henry E. Juengling, and Hugh E. Barrett, Buffalo. N. Y.

New York City, N. Y.—Jenness Motor Truck and Equipment Co., under New York laws, with \$100,000 capital. Corporators, Edgeworth Smith, 136 Fest Fortyfourth street, Thomas E. Fitzgerald, 30 Nassau street; J. Frank Phillips, 605 West 111th street, New York City, N. Y.

In the Retail World.

A. G. Bigelow, of Des Moines, has opened an agency for Maxwell cars at Dubuque, Iowa.

Corder & Flinn is the style of a new firm which has located at Broadway and Seventy-sixth street, New York. They are handling the Acme car.

D. W. Cook, formerly superintendent of the Western Tool Works, Galesburg, Ill., has become a partner in the Galesburg Automobile Co. A. A. Addis is senior member of the firm.

C. Charles Jones, who conducts a garage on Ella street in Beatrice, Neb., is reported to have perfected plans for the erecting of a building 100 by 30 feet, adjoining his garage in which automobiles will be manufactured. He expects to form a \$75,000 company to further the enterprise.

The Livingston & Ramsdell Motor Car Co., New Jersey State agents for the Palmer & Singer automobiles, formally opened their garage in the new De Camp building, 284 Halsey street, Newark, on Wednesday evening. 6th inst. Several hundred visitors were entertained at a collation. This company formerly was in Jersey City.

Germane Becomes Standard Sales Manager.

F. M. Germane, formerly located at Chicago as western representative of the Standard Roller Bearing Co., has been appointed sales manager of the company; he. of course, will have his office at the factory in Philadelphia, where, in fact, he has been located for the past 18 months.

Green Acquires a Top Plant.

C. F. Green has purchased the top plant of the Automobile Equipment Co., Detroit, and combined it with his interests in the Motor Specialty Co. of the same city. Previously Green was connected with the former concern.

POPE TO DECLARE 25 PER CENT.

Substantial Dividend Now Actually in Sight—Facts and Figures Brought
Out at Court Hearing.

The creditors' dividend, which it was known the receivers of the Pope Mfg. Co. have been planning to distribute, but the amount of which was a subject for speculation, now actually is in sight. It probably will be ordered by the courts within the next few days and will amount to 25 per cent-

These facts were brought out last Friday in the Superior Court at Hartford, Conn., when Albert L. Pope, one of the receivers appeared and made an application for an allowance for the receivers, Albert A. Pope of Hartford, and George A. Yule of Kenosha, Wis., for their services.

A. L. Shipman for the receivers, said the receivers of New Jersey had received \$1,500 apiece, and Mr. Pope had received \$2,500 on account in Connecticut before the appointment of Mr. Yule. Both were giving their entire time to the conduct of the business and they asked for \$500 a month apiece.

Joseph L. Barbour, representing six creditors who held claims to the "large" amount of about \$2,000, said his clients were getting restive over the payment of large salaries to the receivers and no payments to the creditors. Mr. Pope countered heavily by stating that he was present at a meeting of a creditors' committee in New York on Thursday where claims of over \$1,000,000 were represented, and that these creditors had stated that they would not oppose a compensation of twice the amount asked.

The difference in the attitude of creditors, as thus shown, caused a smile to appear on the faces of those present.

Judge Curtis ordered an allowance of \$500 for the receivers for their services.

It was in the course of the hearing that Receiver Pope told the court that the Pope company has liabilities of \$1,650,000, quick assets of \$5,000,000 and full assets of \$7,000,000, and that with \$1,000,000 in cash on hand, it was expected that within a few days the court of New Jersey will order a 25 per cent. dividend to those creditors whose claims have been allowed.

Suit to Recover Richcreek Assets.

Harry J. Milligan, trustee for Seth M. Richcreek, bankrupt, has filed suit in Indiana Supreme Court to recover \$10,000 from the Ford Motor Co. and Frederick A. Joss. The complaint alleges that the amount was paid to the two defendants about November 25th by cash and notes upon John N. Navin, the Gibson Automobile Co., J. H. McKernan, Susan McKernan, John J. Williams, English Woolen Co., American Engineering Co., the Capital In-

vestment Co., and others. The complaint alleges that upon the date the notes and cash were given Richcreek was insolvent and his condition was known to defendants. The suit is brought on order of the United States District Court for which Milligan is acting, on the ground that the payment, if allowed to stand, would be granting the defendants preference over all other creditors.

April Report of the E. V. Receivers.

The receivers of the Electric Vehicle Co. have filed with the clerk of the Superior Court. at Hartford, Conn., a report of their transactions during the month of April. The report is as follows:

Maxwell Seeking Pacific Coast Site.

W. B. Jameson, representing the Maxwell-Briscoe interests, is reported as having visited several California cities with a view of definitely locating in that part of the country the Maxwell branch factory, which the Motor World several months ago reported as being contemplated. Jameson is quoted as saying that the factory will have a capacity of 3,000 cars and will be in operation before the year ends.

Parish & Bingham to Make Trucks.

The Parish & Bingham Co., Cleveland, Ohio, have acquired an interest in and made arrangements with the McCrea Motor Truck Co., also of that city, to engage in the manufacture of McCrea electric trucks. These are the small trucks designed for what may be termed interior use, that is for handling baggage at railway terminals, for transporting factory products within factory yards, etc.

"BETWEEN THE SHOWS" MODELS.

Pennsylvania Adds Two to Its Regular Line—Planning Factory for Forthcoming Four Cylinder Roadster.

Ordinarily the practice has been to use the automobile shows as the time and place for the introduction of new models. But there is a well defined tendency to break away from the customs of the past in this respect and to bring out new designs during the riding season. The most recent example of the "between the shows" development is furnished by the Pennsylvania Auto Motor Co., who just have announced the addition of two models to their regular product.

One of the new comers, a five-passenger touring car, is styled "Pennsylvania 25." The power plant consists of four cylinders 41/4x41/4, with valves in the heads. The unit axle and transmission construction is similar to that employed in the present type "C" car, though the wheel base of the new car is slightly less than that of the earlier model, being 105 inches. The price of this new model is \$2,250. The first of these cars will be on the road in about six weeks. The other model, which is well under way and which is expected to be given a "try out" during the next three weeks, will becalled the "Vanderbilt." The power plant, transmission and wheel base will be identical with the "25," but with a higher gear ratio and a light two-passenger roadster body. It is announced that this car will be guaranteed to develop a speed of 75 miles an hour and absolutely to be a stock

The company now is preparing plans for a two-story building 125 feet by 281 feet, the building is to be devoted to the construction of a four-cylinder roadster which will be produced in the fall. At the present time the company will give no detail information of this roadster excepting to announce that it will be sold for \$1,200, will be thoroughly up to date in detail and construction and will be made in only one model, or two passenger roadster.

Elmore Taximeter Cabs for Washington.

The Terminal Taxicab Co., who control the carriage privileges of the terminal station at Washington, D. C., have contracted with the Union Automobile Co., the Elmore agents in that city, for 35 Elmore taximeter cabs, deliveries to commence within 60 days. The contract carries with it the exclusive privilege of such service for a period of ten years.

Hobbie Building Buggies Now.

L. W. Hobbie is reported building a 12 horsepower motor buggy on a limited scale in Hampton, Iowa. He styles his creation the "Hobbie Accessible."

Note the straight-line Body—the hall-mark of Quality.

MATHEMATICALLY EXACT

The Oakland car, in its completeness, is an assemblage of parts, every one of which has been studied and worked out in detail, the result being a matter of mathematical certainty.

There were no theories to advance, no experiments to be proved. Engineering skill and extended automobile experience were united to produce the simplest, most efficient and economical motor car possible. Price was not considered, for elimination of costly complexity and a proper understanding of the object in mind regulated that consideration

Maximum of Power; Minimum of Parts

The Oakland car was designed to realize to the fullest extent the possibilities of the gasolene motor in its simplest and most economical form. This includes first cost, cost of maintenance, operation and long life. We honestly believe the Oakland will stand more hard, legitimate abuse with less attention than any other automobile, regardless of price.

Simplicity of Construction

The power plant is a two-cylinder vertical engine, perfectly balanced, absolutely free from vibration, water cooled by the thermo-syphon, or gravity system (doing away with all gears, pumps, etc.), a transmission that the planetary system ought to be, but isn't, shaft drive with all bearings of more generous surface than provided for in most larger cars, and delivers TWENTY HORSEPOWER AT THE DRIVING WHEELS. Lubrication is positive and unfailing. Engine design insures perfect ignition. Carburetion is constant at all speeds. Semi-clliptic front and full elliptic rear springs provide luxurious riding qualities.

The Oakland is making friends by "making good."

Runabout, \$1300 Tourabout, \$1350 Touring Car. \$1350

Oakland agents are already making money. Would you be one of them? Act NOW.

Cable Address, "MOTORWORLD," NEW YORK.

Entered as second-class matter at the New York Post Office, November, 1900.

NEW YORK, MAY 14, 1908

The Matter of Personal Responsibility.

Nothing would appear more supremely ridiculous at first thought, than the decision of the Tribunal of Louviers that the driver of a motor car is personally responsible for the safe conduct of the driver of another following directly behind it. As well, one might say, make him responsible for the safety of the driver of the car ahead. But then, French laws and French legal decisions are frequently more or less peculiar according to the American understanding.

For example, a law recently enacted provides that any "conductor" or owner of a motor vehicle who, "having been in a collision with any other vehicle or individual or object, does not immediately stop and give his name and address to the police or other representatives of the law," shall be punished by a heavy fine and several months imprisonment. This is entirely independent of the offender's actual responsibility for the

accident, independent of its extent, of its nature. Thus the owner of a car which became involved in an accident due solely to contributory negligence on the part of a second party, if he failed to identify himself to the police at once, might be subject to heavy punishment for the secondary and wholly independent offense.

That there is some excuse for such queer laws as these appear to be, is evidenced from a glance through the morning papers almost any day. Human nature is unchanging, and the causes which have led to such enactments are the same in all countries. Possibly they are accentuated in lands where good roads prevail, but they exist everywhere.

The truth of the matter is that every automobile driver ought to be impressed with his own personal responsibility in the matter of the power under his control. It is a power which may make him disreputable, a menace to the safety of all other users of the highway, or an equally inoffensive member of the crowd. Where that responsibility is lacking, the inevitable counteracting tendency is to establish his liability in one way or another by legal means. However unpleasant the legal form of remedy may be, it is frequently necessary, though not always justifiable in its severity.

In America, though the motoring and non-motoring groups of the public are succeeding more or less successfully in adjusting their differences, and as a rule, are dwelling peaceably together, there still is lacking in a large proportion of the former class the proper spirit of personal responsibility. In just measure to its lack, the chance of increasing weight upon the legal yoke is developed. Most automobile laws assume the purely logical aspect of class legislation. As such they are all the more hateful than would be the case were their application more general. But it is to be remembered that in most instances, they could not be established, were it not for the carelessness of many owners and their drivers in the very matters against which the apparently petty laws of France and other European countries specifically provide.

Lubricants and Lubrication.

Oddly inconsistent is the motorist who, after spending a half hour in anxiously pawing over a dozen different kinds of spark plugs before he can make up his mind which one to choose, will hastily order the

garage attendant to put a half pint of oil in the car, and drive away, satisfied that he has done wisely. Another time, perhaps, the same motorist will spend two or three hours adjusting his lubricator; or use up a half day with a coil expert, because his ignition system is not working as it should and the plugs persist in sooting up-or . down. So long as he pays a good price for his oil, and takes pains to see that it is properly fed, it seldom occurs to him that the root of his troubles may be found in an amber liquid with a bluish cast, which he has purchased innocently by the price tag alone. Yet it is safe to say that no small portion of the motorist's engine troubles may be defined and perfectly well accounted for by the three little letters which spell

The great difficulty is that the average motorist is in no way capable of specifying the qualities which are actually requisite in a proper oil for his engine, and that were he so able, he would not be able to prove their existence without extensive laboratory paraphernalia. Such being the case, there is but one method of escape from the evils of stinking exhaust, foul cylinders, and gummy bearings, which is to buy only a brand which is recommended extensively and known to be suitable. Unfortunately not every maker is as scrupulous as he might be in recommending an oil for his car, but those who are careless in this respect are comparatively rare. It is a fortunate circumstance also that there are on the market several well known brands of oil which are so reputable as to be beyond question. The motorist who specifies either of these -and gets it, is practically certain of obtaining satisfactory results.

There is still the chance, however, that the dealer may belong to the unhappy breed of substitutors, or that in his effort to swell his profits, he is in the habit of boosting the price of inferior oils, for the sake of attracting the custom of buyers who crudely suppose that high price and good quality go together in the compounding of lubricant. Chicanery of this sort is deplorably common, to be sure. Furthermore, there appears to be but one way in which it is to be crowded out of existence. That is for the buyer to insist on obtaining his own brand, and making trouble for the dealer who persists in selling him another.

Dealers who are ambitious to advance their own interests might even make it a point to advertise their stocks of popular brand -lubricants, to recommend them to all customers, and explain how it is that unknown and nameless brands may be injurious to the machine and so doubly expensive to use. If there is insufficient profit in the reputable oils, it would even be more advantageous to advance the price of the standard article than to boost a poorer or a nameless grade which is of questionable quality. It would be better for the market, better for the dealer in the long run, and vastly better for the public. For once it became understood that the brand was the only practical and available criterion of real worth, there would be no quibbling at terms which were within reason.

Improvement of the Electric.

It is a flattering characteristic, rather than otherwise, that the electric vehicle should have attracted so little attention, relatively speaking, during the past two or three years. While the gasolene-driven machine has continued to be an object of anxious solicitude to the general public, the public, and even a good share of the technically minded as well, practically has ceased to notice the electric. .It has become sufficient unto itself, and henceforth its properties and its advancement are relegated chiefly to those to whom its interests are of a specific nature. Outside its own particular branch of the trade, the problems connected with the design and construction and maintenance of the electric vehicle have come to be regarded as wholly incidental to its operation, while that has become merely a matter of dollars and cents with the user. It is rendered conspicuous by the very absence of uncertainty in its performance, and by the economy which is its strongest advantage.

Since its development was lost to view, more particularly since the general public ceased to prate of the perfect battery of former promise, many improvements have been made in its construction. The more significant of these are sketched by, Mr. Churchward elsewhere in this issue. Aside from the battery question, the improvements in motor construction and mounting. in controller design and in the general setup of the vehicle as a whole have been of more sweeping nature than the average motorist has been led to suppose. In fact, so great has been the success of these improvements that the electric vehicle engineer has been forced to resort to close discriminations and the finest of observations in order to carry the improvements still further.

Hence the investigation of the subject of "wattage," and the factors which lead to its reduction. If, wherever the term is employed, the word horsepower be substituted for it, the non-technical reader may be better able to appreciate the significance of its use. Both expressions are equivalent to the extent of signifying the energy absorbed in transporting the vehicle and its load. But the electrical unit is subject to a finer analysis that the mechanical term, so that it is possible to reduce the total figure to terms governed by conditions of load, grade, road condition, mechanical friction. and even to the number of stops made per mile or per hour.

To the average motorist, it may be, these factors do not appeal. But when it is considered that the wattage is what the owner pays for, that it is directly proportional to the precious dollar, its importance becomes more evident. What is quite as much to the point here, however, is that while the designer of the gasolene vehicle is still struggling with little details of design, the electrician has got on to broader fields and has reached a point where his further improvements may be guided and controlled solely by the question of economy in service. Except for the power plant, the two types of vehicle are similar, and the problems connected with their design are closely related. Up to this point, the two branches of the industry are abreast. In power plant design, and in upkeep, however, the latter is considerably in the lead.

Although comparatively little stir is being made just now by the two-cycle movement, that fact should not be taken as indicating a cessation of development, or that the propaganda is losing strength. On the contrary, if the records of the Patent Office are to be accorded any value, nearly as much activity is being devoted to the perfection of the two-cycle motor, as to the more common type. The voluminous nature of patent returns does not measure progress, to be sure, but it does measure the stuff of which progress is made—a just appreciation of the inducements and possibilities of the type. The two-cycle principle has been reduced to practical terms. Many motors now in use are giving absolute satisfaction. All that is required, is proper confidence in it among users, in order to stimulate the makers to further efforts at perfecting it.

COMING EVENTS

May 15, Algonquin, Ill.—Chicago Motor Club's annual hill climb on Perry and Phillips hills.

May 16, Wilmington, Del.—Delaware Automobile Association's 45 miles roadability contest to West Chester, Pa., and return.

May 16, Paterson, N. J.—North Jersey Automobile Club's 100-mile endurance run.

May 16, Hartford, Conn.—Hartford Automobile Club's 200-miles endurance run.

May 20, Indianapolis, Ind.—Indianapolis Automobile Trade Association's 160 miles sealed bonnet endurance run.

May 23. Albany, N. Y.—Albany Automobile Club's annual hill climbing contest up Menand's hill.

May 30, Salem, N. J.—Salem Horse Show and Athletic Association's track meet.

May 30, New Bedford, Mass.—Hill climbing contest up Smith Mills hill.

May 30, Denver, Colo.—300-miles road race for stock chassis.

May 30, Boston, Mass.—Bay State Automobile Association's race meet at Readville track.

May 30, Scranton, Pa.—Scranton Automobile Club's hill climbing contest on Scrub Oak mountain road.

May 30, Newark, N. J.—New Jersey Automobile and Motor Club's 12-hours endurance run.

May 30, Bridgeport, Conn.—Automobile Club of Bridgeport's third annual hill climb.

May 30, Wilkes-Barre, Pa.—Wilkes-Barre Automobile Club's third annual hill climbing contest up Giant's Despair.

May 30, Baltimore, Md.—Motor Car Racing Association's race meet at Pimlico track.

May 30, Cleveland, Ohio.—Cleveland Automobile Club's second annual hill climbing contest.

May 30, San Francisco—California Automobile Dealers' Association's endurance contest.

June 5, Jamaica, N. Y.—Long Island Subway Celebration Committee's one mile record trials on Hillside avenue.

June 6, Williamsport, Pa.—Williamsport Automobile Club's hill climbing contest.

June 24, 25, 26 and 27. Chicago, Ill.—Chicago Motor Club's 1,200 miles reliability run to Dixon, South Bend, Joliet and Chicago.

July 9. Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

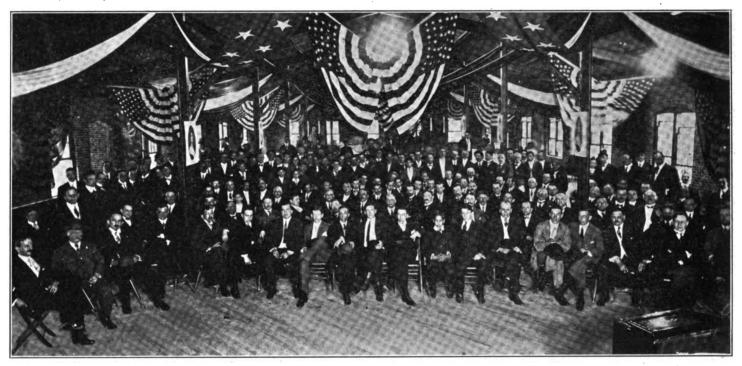

GOV. FORT PRESSED THE BUTTON

Ajax-Grieb's New Plant Starts Under Distinguished Auspices—Trenton's Mayor Assists in the Ceremonies.

When Governor Fort pressed the button which started in motion the machinery in the new plant of the Ajax-Grieb Rubber Co., at Trenton, on Monday, the 11th inst.,

dress by President De Lisser. He spoke of the early struggles of the company and dwelt strongly on the financial and moral support that was given to the new enterprise by Henry Ford, J. D. Maxwell, Benjamin Briscoe, Robert A. Patterson, William Mitchell Lewis, and James Couzens.

"Without the valuable assistance which these men rendered," said Mr. De Lisser, "our undertaking must have resulted in failure. But they stood by us with counsel "I am deeply sensible of the great debt which the Ajax-Grieb Rubber Co. owes you," continued De Lisser. "I cannot express my feelings as I try to tell you how much we appreciate the friendship that has been given us by you and by the interests you represent. Even my best friends have never granted that I can make a speech, yet if I possessed the ability of a trained orator I could not tell you how much I thank you for the interest in our success that you

AJAX-GRIEB GUESTS ENJOYING THE VAUDEVILLE ENTERTAINMENT

his action was perhaps more typical of the sentiment of New Jersey citizens toward the automobile that that of the law makers of the State. The occasion was the official opening of a substantial addition to the new plant, which recently has been completed.

By special trains from New York and Philadelphia the guests of the company were brought direct to the factory, where many of the prominent citizens of Trenton already were gathered. With a profusion of flags and bunting the new brick building presented a gala appearance. The visitors were conducted to the enormous room which occupied the entire upper floor, where the opening exercises were to be held. Here the decorative scheme was continued; the walls and ceiling being almost hidden by American flags and bunting, and posters of the Ajax girl, while at one end of the room was the stage for the speakers and later was the scene of a vaudeville entertainment.

As Governor Fort and Mayor Madden of Trenton entered the room they were heartily cheered by the assemblage and were conductd to the stage by Horace De Lisser, president of the Ajax-Grieb Co., and Harry Grieb.

The exercises were opened with an ad-

HORACE DELISSER (AT WHEEL). HENRY GRIEB, GOVERNOR FORT AND MAYOR MADDEN

and encouragement, and this interest backed by the generous and enthusiastic support of our friends in the automobile industry has made possible and necessary this enlargement of the plant, which is the occasion of this gathering. have shown in the past, and are showing now by assisting in making memorable this evidence of the increased recognition of the merits of our product which compels this addition to our factory."

Governor Fort was then introduced and

WHAT AILED THE CARBURETTER

Simple Trouble that was a Long Standing Mystery—The Cause Easily Eliminated When Found.

made a short speech in which he referred to the Ajax-Grieb company as being an important factor in the development of the State's manufacturing interests. He congratulated the company on their progress and wished them a full measure of prosperity, and expressed the hope that other industries would locate in Trenton and help to strengthen the reputation which the city already had of not being dependent on its legislature for its prominence amongst American cities.

Mayor W. F. Madden, of Trenton, followed the Governor, and spoke in the same vein. He congratulated President De Lisser and his associates on their success and hoped that the future of the company would see its enlargement and development as its past had seen it.

At the close of the speeches the guests were served with lunch, after which they were shown through the factory and initiated into the mysteries of tire making. Later they again assembled on the upper floor where they were joined by the employes of the company and all witnessed a short vaudeville program.

The new factory increases the Ajax capacity to 600 complete tires per day, covers and inner tubes, to say nothing of an immense output of druggists' sundries and other moulded rubber specialties.

Law that Saps Value of Patents.

Beginning August 1st., a new provision of British patent law goes into effect which will act as a direct curtailment of the validity of patents covering articles of foreign manufacture. The clause, which is known as "Section 27, of the Patents and Designs Act of 1907," provides in substance that "Any article patented in the United Kingdom, which is manufactured exclusively or mainly abroad may, on the application of anybody bringing the facts to the knowledge of the Comptroller of Patents, be considered as not protected by letters patent." In consequence of this provision, it is expected that considerable alteration will be made in the status of firms of foreign origin doing business of a proprietary nature in the British Isles.

Cadillac Conducting a Pictorial Campaign.

In a campaign to reach new customers a novel educational and selling method is being developed by the Cadillac Motor Car Co., of Detroit, involving the use of a "picture show" and a lecturer. A complete and expensive stereopticon equipment showing more than 200 views, either taken inside the factory or illustrating Cadillac achievements in various parts of the world, is provided, accompanying which is an hour's interesting and breezy talk on the subject of automobiles in general and the Cadillac in particular. The company's agents invite owners and "prospects" to their local salesrooms to constitute the audiences, and the entertainment is said to be already "booked ahead" for the entire season.

It is often held against the gasolene engine that one of its most provoking characteristics lies in the fact that many of the trifling disarrangements which may from time to time affect its running are exceedingly baffling to locate, the difficulty in this respect often being greatly out of proportion to the seriousness of the trouble. Several seasons ago a prominent expert humorously hit off the situation by saying that in automobile practice the chief difference between steam and gasolene engines was that "with steam engines it takes but a minute to find the trouble and an hour to fix it, while with gasolene motors it takes an hour to find the trouble and a minute to fix it." A recent verification of the latter half of the epigram came within the experience of a prominent New York motorist who has been driving for several years and who rightly considers himself not inapt in finding and remedying trouble when he

For several weeks he had been bothered with his engine missing and cutting uncertain capers. Consultation with repairmen and others soon narrowed the cause down to the carburetter. The latter was taken off and cleaned, the needle valve readjusted and its parts inspected. When the device was replaced the car apparently ran all right but an out of town trip in hilly country developed all the old faults again. In steady climbing on long hills the motor would work very well but on the more level roads where frequent alterations of speed were necessary, it would behave badly indeed. Search after search revealed nothing calculated to disclose the nature of the difficulty, and the driver of the car went from week to week getting the best service out of the machine that he could, but constantly annoyed by the mystery.

In preparation for the drive to the Briarcliff race, he was cleaning the exterior of his engine and oiling up, when he discovered that every time the accelerator pedal was pressed a column of gasolene squirted from the top of the carburetter float chamber, the latter being completely flooded: A moment more and the cause was discovered. The rod leading from the accelerator pedal to the throttle valve of the carburetter passed, in its movement, over the top of the float. Consequently the float would be pushed down every time the accelerator pedal was depressed or released, flooding the carburetter. The remedy was as simple as the cause and consisted in merely clipping off about quarter of an inch from the top of the pin, so that the accelerator rod would not strike, after which the engine ran as smoothly as could be desired. The original cause of the trouble was probably a too vigorous depression of the pedal, slightly bending the rod so that it touched the pin.

Now the Art Dealers Complain.

Again is the automobile accused of interfering with the success of mercantile pursuits. The jewelry trade, having sent forth its wail that motor cars were preferred to gems, must now yield the floor to the picture dealers, who are taking their turn in ascribing the dullness in business to the preference of the wealthy for automobiles instead of paintings. A dealer, who is prominent in art circles, recently speaking of business depression said:

"There is little or nothing being done by the picture dealers. Not only has the volume of sales materially decreased, but it is extremely hard to make collections. One of my patrons, with whom I have had business relations for several years, 'held me up' on the matter of a comparatively small bill which was overdue, and a day or two later I saw him enjoying an outing in a new automobile, which he had just purchased, though he has three others. I have bought several pictures lately," the art dealer continued, "from men who wanted the money for motor cars. Walls which have contained five of six paintings now are occupied only by three or four, and these are separated with remarkable ingenuity so that the effect of the display continues to be good.

"Pictures have always been considered a luxury and automobiles used to be so considered, but the conditions seem to have changed and with the automobile in the necessity column there is little chance of supplying luxuries in the shape of pictures to men who want necessities in the shape of motor cars."

Continental Gets Big Order for Balloons.

While generally it is assumed that the activities of the Continental Tire & Rubber Co. are largely confined to the manufacture of tires, a recent order received from the British government for balloons, proves that such is not the case. The India office have placed an order with the Continental company for 48 balloons, to be used for scientific purposes. The company already has supplied material for many successful air ships, balloons and aeroplanes, notably the "La Patrie," Zeppelin, "Ville de Paris," De la Vaux, and the Farnum aeroplane.

Automobiles for Mail Collection.

Automobiles are to be extensively used by the French government for the collection of mail in Paris. A number of cars were placed in this service a few days ago. It is intended to extend rapidly the use of automobiles for the purpose, and it is thought that by October there will be 120 gasolene cars used for the collection of mail in the French capital.

LOWELL PROJECTS BIG ROAD RACE

Popular Movement for 200 Miles Contest on July 4—Ten Miles Circuit of Fine Roads Available.

Lowell, Mass., has contracted the road racing fever. If plans of the Lowell Automobile Club materialize the fever is expected to break out in a 200-miles race over a ten miles circuit in that city on July 4th. Though the matter was broached only a few days ago the proposition seems to have been received with much enthusiasm in Lowell and no difficulty is anticipated in raising the \$10,000 which it is estimated will be required for the race.

A ten miles course has been selected between Lowell and Tygnsboro, including the smooth and level Merrimac boulevard, and Congressman Butler Ames has offered a trophy for the race. Tiffany already is at work on the design, it is stated. The prime movers of the affair are John O. Heinze and Frank S. Corlew, president and vice-president, respectively, of the Lowell Automobile Club.

While no definite statement has been made concerning the eligibility of cars for the race it is probable that it will be restricted to stock chassis. The contest will be limited to 12 cars and the entry fee has been fixed af \$250.

According to Corlew the entire course is to be guarded by militiamen, it being claimed that the militia authorities in Lowell and Lawrence and the rank and file of the men are wlling to turn out for the purpose, and that under the law they may turn out in uniform and with arms on the Fourth of July without an order from the governor. If 500 militiamen can be secured the guarding of the course will likely be better than at any race ever held in this country.

The course, which has been selected extends along the boulevard to Tyngsboro bridge, then turns to the right over a short stretch of cross road and then down Varnum avenue to the boulevard. At the Lowell end the club plans to improve a short piece of road, making banked turns and a safe and easy connection between Varnum avenue and the boulevard. This will do away with all sharp turns, as those at the upper turn also will be modified. With its few turns and two long stretches the Lowell course will offer plenty of chance for speeding and as it is only ten miles around will add to the excitement, as the cars will be constantly passing and repassing each other.

The Lowell Club has asked for subscriptions for the promotion of the race and the profits to be derived from the entry fees and the sale of grandstand seats will be divided between the city of Lowell, the town of Tygnsboro and the State Highway Commission, it is stated. One of the

main objects of the race is to attract the attention of automobile manufacturers to the Spindle City, as it is claimed that the city of Lowell offers unusual advantages for the location of automobile factories.

Fifteen Events for Dead Horse Hill.

Fifteen events have been carded for the annual Dead Horse hill climb promoted by the Worcester (Mass.) Automobile Club, announcement of which was made this week. The Worcester City Council will give a hearing on the club's petition for the right to close the roads on the day of the climb and it is anticipated that there will be no trouble in this respect. Meantime the work of repairing the roadbed and putting it in shape for the climb is progressing. The list of events is as follows:

Gasolene cars with 60.1 to 75 horsepower, inclusive; gasolene cars with 40.1 to 60 horsepower, inclusive; gasolene cars with 24.1 to 40 horsepower, inclusive; gasolene cars with 15.1 to 24 horsepower, inclusive; gasolene cars with 15 horsepower and under; all makes of motorcycles; free-for-all, open to cars of all types and motive power; gasolene cars selling for \$850 and less; amateur event, owners to drive, for the Worcester County championship trophy, to be won three times in succession; gasolene cars selling from \$851 to \$1,250, inclusive; cars selling from \$1,250 to and including \$2,000; free-for-all, gasolene stock cars only; cars selling from \$2,001 to and including \$3,000; cars selling from \$3,001 to and including \$4,000; cars selling from \$4,000 and over.

Events for Jamaica Subway Celebration.

Entry blanks for the straightaway races. to be held on Hillside avenue, Jamaica, Long Island, on June 5th, under the auspices of the subway celebration committee and the Long Island Automobile Club were issued Tuesday. The contestants will be divided into nine classes, as follows, each class having a change for a try at one kilometre, one mile and two miles, although it will require a separate entry for each: Open to gasolene cars selling under \$1,250; open to gasolene cars selling from \$1,251 to and including \$2,000; open to gasolene cars selling from \$2,001 to and including \$3,000; open to gasolene cars selling from \$3.001 to and including \$4,000; open to fourcylinder cars selling for over \$4,000; open to six-cylinder cars selling for over \$2,500; free for all, open to cars of all types and, motive power; open to steam cars only (stock); stock chassis open to cars having 301 to 550 cubic inches piston displace-

Wilmington Schedules a Reliability Run,

Saturday next, 16th inst., the Delaware Automobile Association will promote its first contest. It will be in the nature of a roadability run, on schedule time, over a 45 miles course from the Wilmington (Del.) court house through Kennet Square and West Chester back to the starting point.

AMERICAN ENTRY RETAINS ITS LEAD

Credited Fifteen Days in New York-Paris
"Race"—Contestants Now Nearing
Siberia on Steamship.

Because of the lost time in going to Alaska, where the route proved impassible, The Thomas car in the New York-Paris "race" has been allowed a 15 days' start over its competitors, from the time they reach Siberia.

The Italian Zust and the French De Dion did not go to Alaska, but sailed from Seattle for Japan, and the judges of the race at a recent meeting decided that the Thomas would have been 15 days ahead of them if it had done the same thing. The German car, Protos, has been handicapped 15 days back of the Zust, and De Dion because it was put aboard a train and shipped from Ogden, Utah, to Seattle.

All of the cars are now on the boat from Japan to Siberia, and on landing the American car will be counted as 15 days ahead of the French and Italian cars and 30 days ahead of the German entry.

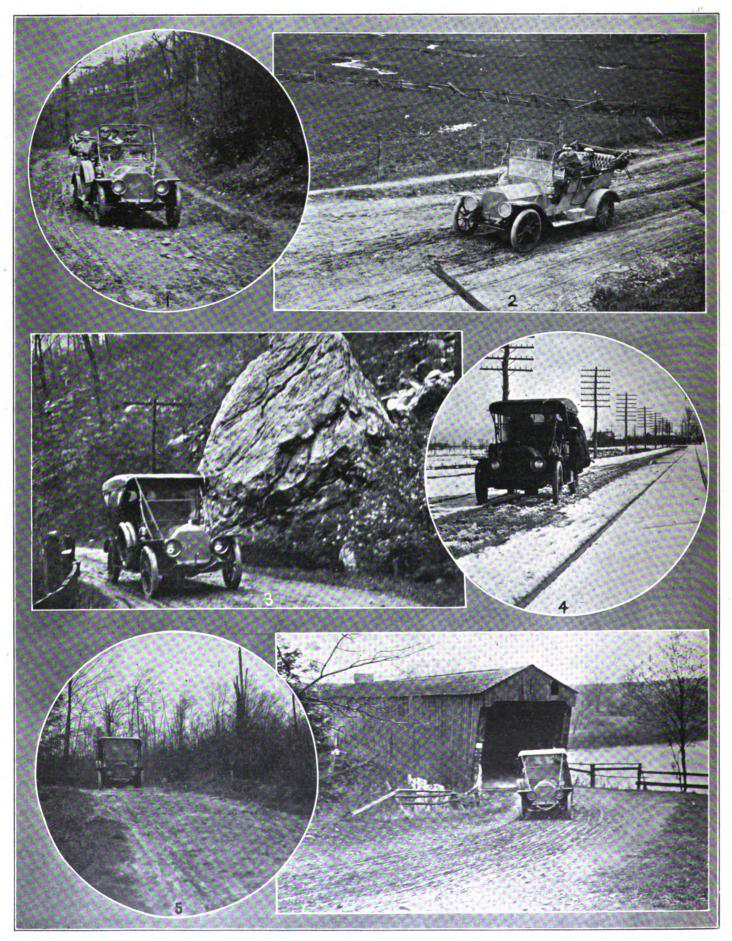

Trophies for Hartford Endurance Run.

What is expected to prove to be one of the largest endurance runs ever held will take place on Saturday of this week, 16th inst., over a course of 174 miles leading from Hartford, arranged by the Automobile Club of Hartford. When the entries closed this week 49 nominations had been made. Six trophies are to be disposed of as follows: To the car listing at more than \$1,500 which makes the nearest to a perfect score; to the car listing at \$1,500 or less which makes the nearest to a perfect score; to the car listing at more than \$1,500 and less than \$3,000 which consumes the least gasolene; to the car listing at more than \$3,000 which consumes the least gasolene; to the car listing at less than \$1,500 which consumes the least gasolene, and to the car which does most consistent work.

Proposed Double Transcontinental Race.

Having been "second fiddle" to Le Matin, of Paris, in the New York to Paris race promotion, the New York Times is now endeavoring to get up a race of its own, and has, undertaken to interest manufacturers and others in a trans-continental contest across North America, from New York to San Francisco and back again, a different route being taken for the western and the eastern trips. So far all the plans are rather hazy, but in addition to definitely promising a suitable trophy the following tentative plan of the contest has been outlined: A contest for regulation stock cars under a maximum power and over a minimum weight, a speed trial, an endurance test, the cars to be handled by a single crew, and scored according to a strict schedule.

VIEWS ON THE GLIDDEN TOUR ROUTE FOR 1908

1. ON THE ROAD TO PITISBURG. 2. THROUGH PENNSYLVANIA OIL FIELDS. 3. PICTURESQUE ROAD TO JOHNSTOWN, FA.
4. JUST OUT FROM BUFFALO. 5. ON THE CREST OF THE ALLEGHANIES. 6. COVERED BRIDGE ON ROAD TO MARRISBURG.

SELECTING THE GLIDDEN ROUTE

Pathfinders Make Substantial Progress— New York not in Itinerary and New Jersey to be Avoided.

Buffalo, Pittsburg, Philadelphia, Albany and Boston will be the four largest cities touched by the American Automobile Association's touring contest for the Glidden trophy this year and they will be reached in the order named. New York City will not be entered and New Jersey soil will not be touched during the tour.

The route was changed on Monday so as to include Philadelphia and avoid New Jersey. Secretary Dai H. Lewis and his sixcylinder Premier pathfinder had reached the Delaware Water Gap, but Chairman Hower directed that they go back to Harrisburg and lay the route from there to Philadelphia. The big car, driven by Ray Mc-Namara, did not get away from Harrisburg until nearly noon on Monday and did not reach Philadelphia until Tuesday night. Tuesday's run made the twelfth day out for the pathfinding car, but on the tour itself Philadelphia will be the stopping place on the night of the sixth day out, or the fifth day of travel, the Sunday previous being spent at Bedford Springs, Pa.

The reason for eliminating New Jersey from the route of this year's tour is the sandbagging motor law of the State. It was originally planned to run from Philadelphia to Atlantic City and spend Sunday at that resort. It would have cost the contestants about \$13 license fee for each car, however, for the two days and so the State was avoided and instead of getting a reasonable fee, like other States, it will get nothing. Its principal resort will likewise be minus several thousand dollars that the tourists would have spent there but for the attitude of the State's law makers toward those who use automobiles.

The run for each day and the stopping places at night and Sundays, as thus far arranged, are: July 9, Buffalo, N. Y., to Cambridge Springs, Pa., 117.4 miles; July 10, Cambridge Springs to Pittsburg, Pa., 110.2 miles; July 11, Pittsburg to Bedford Springs, Pa., 106.4 miles; July 12 (Sunday), at Bedford Springs; July 13, Bedford Springs to Harrisburg, 107.3 miles; July 14, Harrisburg, Pa., to Philadelphia, 133.5 miles; July 15, Philadelphia to Milford, Pa.; July 16, Milford to Albany; July 17, Albany to Boston.

From Boston the tour will go up into Maine, thence back into the White Mountains and probably will disband at Saratoga on July 22 or 23. The details beyond Boston will not be settled until after the pathfinding trip is completed.

As the Premier pathfinder has proceeded, Secretary Lewis has made note of every turn, of the character of the roadbed, the land marks, the toll gates and their fees, and of the distances between each turn and crossroad, so that the route book issued will be more complete in detail, more accurate and of permanent value as a touring guide. Nearly all of the overnight stops will be in big cities, where there are ample accommodations, and arrangements have been made all along for putting up the tourists at regular rates.

Following the usual custom, the first few days of the tour have been made comparatively easy and the harder days will come later in the mountains.

Four Days' Carnival for Stroudsburg.

A four day automobile carnival during the last week of June is the ambitious program announced by the recently formed Monroe County Automobile Association, of Stroudsburg, Pa. If present plans are carried out the carnival will be one of the biggest of its kind that has been attempted. For the first day it is planned to run a sealed bonnet reliability contest, starting simultaneously from New York and Philadelphia, to end at Delaware Water Gap, and this will be followed on the second day by several hill climbing events for amateur drivers to be run on a less tortuous hill than that used by the professionals. The third day will be devoted to a series of time trials over a level stretch of road near Mount Pocono, while a half mile track in the neighborhood of Stroudsburg will be used for a gymkhana meet on the final day of the carnival.

Trophy to be Converted into Badges.

A solution, as unique as it is unusual, has been found by the Norristown Automobile Club, by which it may dispose of the silver trophy that was won by 15 perfect scorers in its recent endurance run. The owners and drivers of the cars that finished the run without points against them met last week and voted to melt the trophy that had been offered to the winning car, and run it into badges. They considered this expedient more satisfactory than having their names engraved on the cup.

Stanley Hill for Cleveland's Climb.

For the first time since the inauguration of its annual hill climbing contest the Cincinnati Automobile Club will not hold its contest on Paddock hill this year. The date has been set for May 28th, and Stanley avenue has been selected as the venue. The course is a new one averaging from 11 to 15 per cent. grade. It has two turns, but both are slight. The change was made because of the poor condition of the Paddock hill road.

Following the lead of other prominent clubs throughout the country, the Albany (N. Y.) Automobile Club is determined upon an active compaign against overspeeding. All the members are entering an agreement to report offenders.

CLUB COMPELLED TO TOE MARK

Withdrawal of White's Protest did not Settle Wilkes-Barre Snarl—All Differences Now Reconciled.

Despite the fact that Walter C. White withdrew his protest in reference to the Wilkes-Barre hill climb the A. A. A. racing board declined to grant a sanction to the Wilkes-Barre Club until late last Friday afternoon.

The facts of the case are that White's withdrawal of his protest was absolute and unconditional but the racing board held that the Wilkes-Barre Club should comply with the original ruling of the racing board. For that reason the sanction was withheld until the terms of the original ruling of the racing board were fully complied with. The free-for-all trophy in last year's hill climb, the Board of Trade Cup, is in the possession of J. B. Ryall, and he absolutely refused to surrender it.

The Wilkes-Barre Club offered to give Mr. White a cup equal in value to the Board of Trade trophy and, thereupon, the racing board allowed the sanction. White, however, withdrew all opposition two weeks ago, when the Wilkes-Barre Club offered to give him a medal and to re-engrave the Board of Trade cup, and was in no way responsible for the eleventh hour mix-up.

Reliability Run Plans Kept Dark.

Hiding a heavy secret in their breasts, the members of the Indianapolis Automobile Trade Association are going around with their fingers to their lips, trying to conceal the rules and route of the reliability run which is slated for May 20. These are to be announced only a day or so before the day of the run, so that intending competitors will not have a chance to practice on the route or make elaborate special preparation of their cars. It was also thought that an early announcement of the route would perhaps arouse the antagonism of farmers and others along the roads specified, who might put obstacles in the way of the run.

Smooth Roads for Rocky Mountain Run.

In spite of the fact that it is to be called the "Rocky Mountain endurance contest," thereby suggesting leaps from crag to crag, and the hurtling of precipices, the race for stripped stock cars which is to be held at Colorado Springs, Col., on Memorial Day, will be held on roads that are smooth and far from mountainesque except in their scenic features. The promoters have employed a big force to put the roads in perfect condition for the contest and a large entry list has been secured. The course is known as the Sand Creek-Barr-Brighton course and the grandstand will be at Sand Creek.

PHOTOGRAPHING ROAD RAYELIING

Government Secures Pictorial Records of the Effects of Motoring—Relation of Speed to Destructiveness.

With a battery of photographers to "snap" its flight, a big racing car going over a mile a minute threw a scare into the farmers along the celebrated Conduit road, outside of Washington, not long ago. Many of them thought it was a machine designed for some of the big world events, and that the photographers were employed by the newspapers. Such was not the case, however, the surprising feature of the affair being that it was wholly a United States Government enterprise.

Inasmuch as the government asserts its ownership and control of the Conduit road, regarding it as a military highway, it can permit as high speed as it likes, a legal point which Marshall Collins of Glen Echo was at one time prone to dispute, but the strength of which has since forced him to give up arresting motoring diplomats and others for the more peaceful occupation of working in a dry goods store. Therefore the Government's racing car was allowed to go the limit.

The object of the apparently mad dashes and the corps of photographers was to give the Office of Public Roads accurate data as to the effect that high speed automobiles have on rock surface or macadam roads. To this end the trials also included the passage of horsedrawn vehicles and automobiles of various weights and speeds, the dust clouds raised by each being photographed.

What was disclosed as a result of the experiments is made known, by the official statement which is in part as follows:

"Those who witnessed the experiments near the national capitol could not doubt for a moment that the various road experts all over the world are correct in the opinion that very rapidly driven automobiles are tearing up the surface of the macadam road, for not only were huge clouds of dust lifted into the air and blown off the road, but careful examination showed that the material under the wheel tracks of the machine was distinctly loosened and ravelled even during the short period of these tests.

"No such effects were noticeable after the passing of iron-tired vehicles; the series of tests beginning with the passing of a horse-drawn vehicle. This was photographed as it moved along, and also as the wagon tires passed a given mark. Then the automobiles were sent over the course. The first was a heavy-weight touring car moving at five miles an hour. A series of pictures was made of that car at varying rates of speed until its maximum of 45 miles an hour was attained. Then the work was taken up by the huge racer, which tore down the road

first at a speed of 50 miles an hour, then at 55, 60, and finally at 65. It fairly lifted the road surfacing material as it sped along, regular ridges of rock dust rising from the rear wheels and floating away in blinding clouds. Other tests were made and other pictures taken of various types of heavy cars and runabouts. It was plainly noticeable and was commented on that automobiles moving at the slow rates of speed equal to the speed made by horse-drawn vehicles made very little dust, the theory that fast speeding automobiles are responsible for road surface destruction being pretty thoroughly substantiated by these means.

"The results of this interesting bit of road work will be carefully studied and put together in a paper or papers to be presented to the International Road Congress which will meet at Paris on October 11; for so far-reaching are the ravages of the automobile on the wonderful roads of France that that country has urged highway engineers of all lands to assemble at her gay metropolis in the fall to take up the problem and strive for a solution of it.

"It has long been known to highway engineers that automobiles were shorteningthe lives of the rock surface roads of the world and many experiments have been made in the past six or seven years to determine the actual cause of the damage done. To understand how the soft broad tires of the modern motor car can work an injury to a surface that not only withstands, but improves under the constant passing and repassing of vehicles with iron tires, one must be apprised briefly of the theory on which, first Tresauget of Lomoges, and later MacAdam of Ayr, worked when giving such highways to the world. They reasoned that a road surfaced with bits of stone would improve under wagon traffic because the iron tires of the passing vehicles would constantly crush the stones and form rock dust particles; that those rock dust particles would not merely fill in all the interstices between the stones, but would also form a surface dust binder; the wettings and rollings tending to cement the dust in a shell-like surface and thus make the entire road one traffic-withstanding, water-shedding mass.

"They reasoned well and wisely. The macadam roads lived up to the theories of their inventors and improved with the passing years until the advent of the automobile. It was but a short time after it came into vogue that highway engineers in all civilized lands learned that a new condition was confronting them, and established customs were being menaced. The trouble was traced to the automobile and studied. It was noted that the soft rubber tire was the highway menace. It crushed no rock itself, and therefore contributed no quota of the needful surface dust binder, while the tremendous tractive force of the rear wheels drew up the dust made by the iron-tired wagons and sent it whirling away over adiacent lands.'

FOR GOOD ROADS AND GOOD LAWS

Partial Program for the Convention at Buffalo—Highway Experts and State Governors Who will Attend.

If present plans do not miscarry the good roads and legislation convention which is to be held in Buffalo, N. Y., Tuesday and Wednesday, July 7th and 8th, by the American Automobile Association will assume more importance than was at first supposed. The committee, which has in charge the arrangements for the convention met in New York City on Tuesday of this week and showed that it has not been idle since being formed.

Chairman Robert P. Hooper, of Philadelphia, presided, the other members in attendance being Charles Thaddeus Terry, Frederick H. Elliott, and Alfred Reeves, New York City; Paul C. Wolff, Pittsburg, and George C. Diehl, Buffalo.

Although the list has not been completed it is certain that several noted speakers will address the convention upon the subject of good roads. The speakers who are assured are Joseph W. Hunter, State highway commissioner of Pennsylvania; W. E. McClintock, State highway commissioner of Massachusetts; and Frederick Skene, State engineer of New York. It is expected also that Governors Hughes of New York, Harris of Ohio, and Stuart of Pennsylvania will deliver speeches.

Mayor J. N. Adams of Buffalo will formally present the key of the city to the visiting automobilists on Tuesday, the 7th. The first session will be devoted to a discussion on Uniform Automobile Legislation, and will be under the direction of Charles Thaddeus Terry, chairman of the legislative board of the American Automobile Association. The afternoon will be given over to a discussion on Good Roads, under the direction of Chairman Hooper of the good roads board of the national organization. In the evening the delegates will be entertained at one of the local theaters.

Wednesday morning will be devoted to a further discussion of the subjects relative to good roads and the afternoon will be taken up by a series of practical demonstrations by noted road builders on the maintenance and the preservation of the highways. A feature of this demonstration willbe the tests showing the best methods to be followed in preparing dustless roads. An automobile tour of inspection of the roads in construction in Buffalo will be included in the afternoon's program.

At the meeting on Tuesday last Alfred Reeves was appointed chairman of the publicity committee in charge of the convention. George C. Diehl of Buffalo was appointed chairman of the committee on practical demonstrations on roads.

SPECIAL BODY FOR FIRE CHIEF

Pierce Favors St. Paul by Departure from Stock Model—Conveniences Provided for Head Fire Fighter.

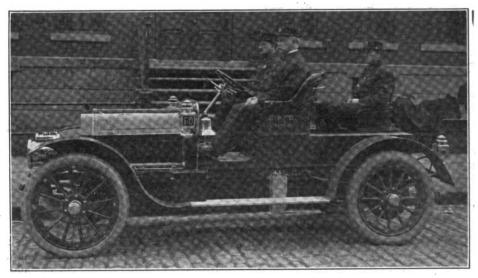

Following the example set by many cities St. Paul, Minn., has furnished the chief of its fire department with a motor car—a 45 horsepower Great Arrow, which was bought from the St. Paul agents of the George N. Pierce Co., of Buffalo, N. Y.

While the makers of the Great Arrow have done practically nothing in the past in the line of designing special bodies, they have made a notable exception to their rule

town unless the tax per diem is paid, but it is not thought that it will be enforced except in the case of the stage line's cars.

Automobile Apparatus for Fire Brigade.

As a result of something like two years of experimental service, in which both steam and electric machines have been employed, Herr Reichel, chief of the Berlin fire brigade, has decided upon a permanent equipment of electrics for service in the inner districts of the city, and of steam cars for the suburban regions. The test, for which an appropriation of about \$12,500 was secured, has been most thorough. The electric machine under test averaged two trips drily, frequently running as much as 22 to 25 miles outside the city. During the month

ST. PAUL FIRE CHIEF IN HIS PIERCE GREAT-ARROW.

in this case, as the accompanying illustration of the St. Paul fire department's car serves to show. While the chassis is of the standard model, the body has been designed to fulfil the requirements of a fire chief. The rear seat is of the disappearing type, and the rear under-body is arranged to furnish storage for the boots, helmet and other paraphernalia of the fire fighter.

Ohio Town Bars Automobile Stages.

Commercialism clashed with progress and set the 500 inhabitants of Jackson Center, Ohio, to talking when a local merchant succeeded in pushing through the council an ordinance which practically bars all automobiles from the town. The ordinance provides that automobiles shall pay \$1 a day for use of the streets, and owners shall be fined from \$5 to \$25 for each refusal to pay this tax. An automobile stage line from Jackson Center to Wapakoneta became so popular a local dealer complained it was taking trade from him. The ordinance was the inspiration of his perplexity. Council's move was promptly met by the stage line announcing that it would run its cars only to the town limits of Jackson Center. The ordinance however is worded so that it bars all automobiles from the of July, 1907, no less than 611 miles were covered; this being about the average mileage of a horse-drawn fire-engine during an entire year.

Automobile Serves as a Traveling Chapel.

While the automobile as an agent for evangelical purposes is not new, there is, however, a smack of novelty in the large sight-seeing car that has been utilized as both a traveling chapel and an advertisement for a Philadelphia church. Every evening the car is filled with 30 gospel singers, accompanied by a trombone playera cornetist and a minister, at the corner of Broad and Arch streets, and proceeds on a tour. Five stops are made en route when the choir sings and the minister makes a brief exhortation. Two large signs, announcing a "surprising Southern singer" and telling of a "wonder pianist" are prominently displayed on the sides of the car.

Kaiser Wilhelm Giving up His Horses.

Motor cars are growing in the favor of Emperor William, of Germany, to such an extent that he recently sold a number of his horses and has created a special automobile department in the Imperial stables. Already the Kaiser has nineteen machines,

GERMANY SHOWS RAPID GROWTH

Big Increase in Number Both of Pleasure Cars and Commercial Vehicles—Nearly Doubled in Bavaria.

During the year 1907, the use of motor vehicles in the German Empire increased something like 33 per cent. over that of the year previous, according to Consul General Nicolas Ifft, of Annaburg. By the official statistics, recently published, the whole number of vehicles in use on January 1, 1908, was stated to be 36,022. Of these, 34, 244 were designed for passenger transportation, and 1,778 for freight. Somewhat more than half of those rated as passenger vehicles, however, were motorcycles.

The increase was much larger, proportionally, in South Germany than in North Germany, being but 17.2 per cent. in Prussia as against 84.8 per cent. in Bavaria and 148.1 per cent. in Hesse. In the city of Berlin the increase in the number of motor vehicles for the year was only 6, or 0.2 per cent. Of the passenger vehicles, 14.046 were used for business or professional purposes and 13,771 as pleasure and sporting vehicles. During the year 5,686 motor vehicles passed the frontier for temporary use for touring purposes in the Empire.

That close system which is such a characteristic Teutonic asset, is revealed in the coupling of close figures as to motor accidents, with the number of vehicles in use. For instance, during the period of one year, in the province of Brandenburg, the ratio of accidents to machines was about 1 to 2, while in the Rhineland, there was only one accident to every 20 machines. In 95.5 per cent. of the whole number of 4,864 accidents recorded, the owner of the vehicle causing the accident was identified, and in 1,406 cases, punishment was meted to offenders.

Rambler Aims to Interest Doctors.

"There are two classes of automobile buyers," says the Rambler Magazine, editorially. "One class always buys a product that is either of unreasonable cost or very cheap in price. The other class always demands proof of worth, and that is the only true measure of cost." It is to the latter class that the efforts of Thomas B. Jeffery & Co. are being most strongly directed, and especially for the benefit of a strong contingent of that class, the "Physician's Number" of the magazine has just been issued. It is packed from cover to cover with relations of the experiences of a great number of owners who have employed their cars professionally, and found the service to be of advantage in their work. The contents carry conviction, and as the edition is to be distributed to 50,000 prospective owners, it is easy to imagine it may prove a remunerative as well as an interesting effort of publicity.

TWO VALVES COMBINED IN ONE

New Foreign Motor with Novel Form of Valve Gear—Original Method for Securing Double Service.

Although there are many advantages connected with the use of the independent poppet valves which commonly are used in gas engine practice, it is evident that where it is possible to combine the functions of both the inlet and exhaust organs in one moving part, considerable advantage is likely to be gained, particularly if the combination be possible to effect without loss of efficiency, mechanical or thermal. In the telescopic valves which are featured in the construction of the Franklin motors this year, a very close approximation to this desideratum is obtained by the use of two concentric valves. A recent foreign design which accomplishes the distribution with the use of only one moving part, however, and which, for its specific purpose appears to be wholly practicable, is the valve gear employed on the R. E. P. motors, which have contributed to no small stir in the aeronautical world abroad.

The most striking feature of these motors, aside from their very light weight, and high ratio of power to weight, is the fact that they are built in V-formation, and of 5 and 7 cylinders, according to the power requirements of the flying machine they are to serve. Because of the rigorous demand for economy of metal in their construction, the use of the one-piece, double-service valves, is particularly noteworthy.

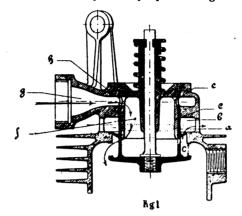

From the accompanying figures some idea of the method by which the double duty is secured, may be obtained. In Fig. 1, the valve is shown in the inlet position. It will be seen that its diameter is relatively large as compared with the cylinder bore, and that the casing or chest in which it works comprises two chambers separated by a horizontal wall, the upper being the intake, and the lower, the exhaust passages, respectively. The cap closing the central portion of the chamber, and also supplying the guide for the valve stem, is made with a depending sleeve, which comes down nearly to the level of the top of the combustion chamber, and is separated from the walls of the central chamber by a space just sufficient to admit the sleeve, which is the main characteristic of the valve itself.

The valve, which is made with independent head and stem, is composed of the sleeves mentioned, and a couple of flanges, the lower of which forms the valve proper and secures the intermittent closure of the combustion space. The sleeve is pierced by two sets of small circular ports, the upper row of which afford communication between the interior of the valve and the intake port. The lower row connects the interior with the combustion chamber simultaneous-

THE MOTOR WORLD

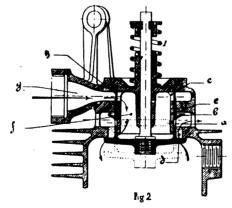

ly. The upper flange serves to exclude the entering gases from the exhaust port during the period of admission.

In the inlet position, as shown, the gases enter through the usual manifold connection at g, passing through the ports, h, to the interior, f, of the valve. Thence they pass downward as indicated by the arrows, and enter the cylinder proper through the

ports, c. During this interval, the flange, b, is seated in the cylinder opening surrounding the principal port, thus excluding the gases from the port, s, which surrounds the cylinder head and gives outlet to the exhaust through a series of small circular ports. In this connection, the construction of the valve sleeve and the closing cap, c, with its depending sleeve forming the valve seat or guide, is plainly shown.

At the end of the intake period, the valve is permitted to close to the full length of its travel, when the head, d, rises into its seat in the cylinder head, sealing the combustion chamber, as in Fig. 2. The openings in the lower part of the valve sleeve now register with the blank wall of the

lower portion of the cap, e. while the ports, h, in its upper portion, are sealed by the same member. For the exhaust stroke, a slight motion of the valve, opens communication between the cylinder and the atmosphere through the large circumferential port, but excludes the fresh intake gases by reason of the registry of the ports in the lower part of the valve, with the lower part of the sleeve. The intake relation is again established by the complete motion of the valve to the lower end of its travel.

From this it will appear that the valve

gear required may be essentially simple, the motion necessary for both intake and exhaust being merely the direct thrust common to all poppet valves, with the modification required to cause a dwell of one stroke in mid-travel. The principal advantages are that the combustion chamber is left perfectly plain, making possible a high compression, a simple casting, and a clean-working engine; that the exhaust gases have a free release and a short path to the atmosphere, in this case without the intermediary of an exhaust manifold or muffler; and that the passage of the live gases through the interior of the valve has a cooling effect upon it, as a result of which the cylindrical construction, with its considerable bearing area, is made possible. For the motor of larger size and more arduous service, it may be questioned whether such an arrangement would be entirely practicable. At the same time the suggestiveness of the system makes it well worth consideration with regard to its possible availability.

Waterproof Slip Covers for Cushions.

Slip covers for protecting the upholstery are an important adjunct to the car which is to be kept in good order internally, even though subjected to severe road wear. It is necessary that these coverings be of the right sort, however, if sufficient use is to be obtained from them to repay their cost. They must be cut to the exact shape and size of the cushions they protect, and they must be so contrived that they will go on easily, and without danger of stretching or tearing. The material should be reinforced with patches under each fastener, and the fasteners themselves should be not too bulky and of a secure type. For binding the seams, enameled binding leather is more suitable than any other sort, and further, possesses the advantage of helping to keep the material in shape. The goods employed for the purpose, should, of course, be of a serviceable, water proof variety.

Adaptability of Steel Belt Transmission.

Although the use of belt drive for motor car transmissions has entirely disappeared except in the case of one or two light vehicles at present manufactured abroad, it is possible that recent developments in the use of steel belting for transmission purposes in power plants may cast a new light on the matter. As a result of a series of exhaustive trials by a German firm, it has been found practicable to use steel for belting purposes with a remarkable degree of economy. It is stated that on account of the solidity and lightness of the metal, a belt of 1-6 the width of the common leather belt and of considerably less weight may be used. As it can be given considerable tension, the distance between the driving and driven members may be rigidly fixed, while centrifugal force and its effects are reduced to a minimum. The total power loss is claimed to be not over 1 per cent., while the slip is less than 1-10 of 1 per cent.

APPEAL OF THE MOTOR BUGGY

How the Country Physician "Doped It Out" for Himself—Then He Got an Unpremeditated Demonstration.

How great is the attraction which the motor buggy holds for the man whose need of personal transportation over the highway is imperative, is not generally appreciated by those whose motoring experience is drawn solely from contact with the more elaborate and conventional types of vehicle. That it is based upon logical conclusions, must be evident from the very type of owner and prospective owner to whom this class of machine most appeals. In other words, to the man who requires a certain number of vehicle miles at the lowest possible cost, and whose use of the vehicle is to be largely a business one, the motor buggy appeals, simply because of its lack of superfluous details in any way, and its practical appearance. A valid consideration in this connection, which also carries great weight, is the fact that it is designed for a solid tire mounting.

Not infrequently it happens that interest in this type is developed in unexpected quarters. The experience of a local agent for a well known make of high wheeled machine is an interesting case in point. He was driving his demonstrating car on a 25 miles trip to a neighboring city. As he passed through a small town on his way, he noticed be was being closely watched by a man of studious aspect, who was standing by the curbstone beside a medium-powered runabout of conventional design. Looking back a few moments later, he was surprised to note that the same man had got into his car and was following only a short distance behind him.

'As the road was clear and in good condition, I 'let her out' pretty well," says the agent in question, "and though I knew about what the other machine would do, I was not altogether surprised that it did not pass me, even when it came up close behind once or twice. Finally, on a long down grade, it shot ahead, and I had expected not to see it again, when, much to my surprise, I found it waiting by the roadside in a village just at the foot of the hill, with its owner standing in the middle of the road and 'flagging me.' At first I was disposed to question his purpose, and had visions of local bailiffs and other unpleasant rural factors. But his first words checked all doubts on that score, without, however, enlightening me as to his pur-

"'Are you in much of a hurry?' was his question when I stopped beside him.

"'No,' I said, 'not much.'

"'Because if you are not, I want to talk to you just a minute.'

"So I told him 'talking' was part of my

business, and if there was anything in reason he wanted to talk about, I would be glad to accommodate him.

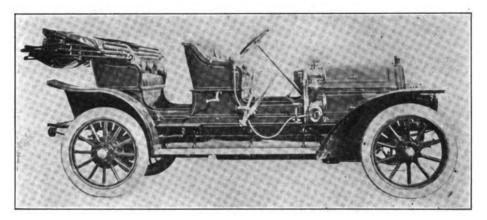

"Well, sir, it turned out he was a doctor, and lived back there in that little town, where he had a pretty wide-spread practice. Some two or three years back he had bought his machine, and was using it right along. But he had become interested in the high wheel proposition recently, and was anxious to talk it over with someone who knew all about it. So I told him I was just the man he wanted to see.

"It seems he had followed me all along just for the sake of observing how the buggy worked on country roads, and having stolen a demonstration as you might say, in this way, he was ready now to talk upkeep and all that sort of thing. He had no complaint against his own machine in any particular

DOUBLE RUMBLE WITH A TOP

The Thomas Tourabout a Compromise Between Runabout and Touring Car— Features of Its Adaptability.

In the development of automobiles the tendency of the times lies more in the line of refinement and simplification of body design than it does in alteration of the power plant. Probably the most striking change that is manifest in the outward appearance of a motor car is seen in the development of the rumble seat, which within the past year has attained a large degree of popularity. As the idea of the rumble found favor, the manufacturers of cars with this feature extended its scope by designing it

THE THOMAS TOURABOUT

way, he told me, but at the same time he had come to the conclusion that it was not just what he wanted.

"'The great trouble is,' he said, 'that when I get a call in the middle of the night, I have got to waste time in pumping tires. This don't happen all the time, but it happens often enough to make me average just about as much time in getting away from the barn as though I had to stop and harness a horse. Then, too, there are times when a little more road clearance would add materially to my average speed.'

"More than that, he said he was using more car than he needed. He was sure there was more machinery and more weight to be handled, and consequently more expense in connection with its use, than was really necessary. He had about decided that the high wheel proposition was what he wanted to tackle, but he had had some doubts as to the way the high wheels would work on the road, and as to how much speed could be made without shaking the rig to pieces. That chase behind me had settled his opinion.

"And this, mind you," concludes the dealer, "from a man who has driven an ordinary light runabout for a good many thousand miles, and sober miles at that, and who had 'doped' out his conclusion without any help from anybody else."

for the use of two persons instead of one, and following the line of development still further, the next step was in the arrangement of a top for cars so equipped. With the addition of the top the development of this type of car seems to be complete. The rumble back differs from the touring body mainly in the absence of doors and in the lighter construction which is made possible because of this elimination.

The latest car of the double rumble type is a very attractive model made by the E. R. Thomas Detroit Co. This car, which has been named the Tourabout, combines the lightness and speed of the Thomas runabout with almost the carrying capacity of a touring car, as shown in the accompanying illustration. A feature of this latest Thomas model is the ease with which the rear seat can be removed and a single rumble, or a trunk substituted.

The power plant consists of a standard Thomas-Detroit Forty motor, of the four-cylinder vertical type, with cylinders of 5 by 4¾ inches dimensions, and three-speed, selective, shaft transmission. Timken roller and Hess-Bright ball bearings are used throughout except in the crank journals and on the connecting rods, where die pressed tin babbit bearings are utilized.

The Tourabout weighs about 2.400 pounds and is flexible and easy to control.

RAN SECOND TO RIDERLESS HORSE

Automobilist Sued for Damages Nine
Months After a Nine Miles Heat—
Two Stories of the "Race."

A nine miles heat, said to have been made between Jeffersonville and Utica, Ky., in from 35 to 40 minutes, between an ordinary farm horse of mature years, and, as the complaint refers to it, an "Auto-Mobile," was the subject of a trial that has occupied considerable time of a jury in the Clark Circuit Court at Jeffersonville, Ky. The plaintiff was Fletcher Bushfield, a Utica township farmer, and the defendant, Charles C. Peel, who conducts a bicycle and automobile repair shop in Jeffersonville.

Peel owns a large car in which he frequently takes his family out for pleasure trips. One of these was made to Charlestown on April 27, 1907, and on the return voyage he "flushed" a horse belonging to Bushfield. The animal did not take kindly to the vehicle and with head and tail erect, started down the pike for Jeffersonville, nine miles distant. The race was an exciting one and along the line the people were notified by telephone of the novel contest. Many went out to see the race, but none attempted to stop the steed that persisted in keeping in front of Peel's machine. The horse finally ran into a Jeffersonville livery stable, still ahead of the automobile, having covered the nine miles, as alleged, in about forty minutes.

It was not until January 11, 1908, that Bushfield filed suit for \$125 as damages, the full price of the horse. In his complaint, he alleged the horse was on a public highway when Peel came along in a large, powerful and rapid-geared "Auto-Mobile." causing the animal to take fright and run down the pike. It was alleged Peel made no attempt to stop the machine, but continued to chase the horse. By reason of the long run it was alleged the horse was made sick, sore, "staved up," rendered unfit for service and damaged in the sum of \$100, judgment for \$125, the true value of the horse being asked.

Some of the testimony was interesting, but the witnesses varied on the time the race took place. Some said it was 4 o'clock in the afternoon, while others fixed the hour at 6 o'clock. All of the witnesses for the plaintiff said the machine was "goins some"; so was the horse in keeping ahead of it. One witness testified that she had been notified of the coming of the horse and machine and went out to see the race. She said she would not make an attempt to stop the horse through fear she might be run over by the automobile on account of it going so fast.

When Peel was put on the stand he said he was delayed by the horse until an hour was consumed in making the trip. He said the beast would not turn to the right or left and that when the machine was slowed down to give the animal a chance to leave the road, he would not do so, but persisted in jogging along in front of the automobile. He said he used every possible endeavor to get the beast to leave the road, but he would not do so.

Automobiles Serve as Political Rostrums.

While automobiles long have been used by political candidates and spellbinders during the campaigns, the use largely has been confined to the service of transportation. Occasionally the motor car has been utilized as a platform from which to address gatherings, but it remained for Winston Churchill to discover the value of the top of a limousine as a point of vantage from which to appeal to his hearers for their support. During his recent campaign for a seat in Parliament, Churchill hurried from place to place in a car equipped with a limousine body. Instead of engaging halls in which to address the voters. Churchill pulled up at convenient street corners and mounting to the roof of the limousine, made his speeches from a decidedly advantageous standpoint.

Chicago politicians have gone even farther by equipping machines with speakers' platforms, for street metings. Four cars thus equipped convey Republican campaigners from point to point, the arrival at a speaking site being heralded with bugles and red fire.

Organized to Fight the Jersey Law.

In accordance with the determination to fight the amended Frelinghuysen law a committee representing the associated automobile clubs of New Jersey will make its first attack on the constitutionality of the license clause. The committee was appointed at a meeting of the Associated Clubs held May 7, at the New Jersey Automobile and Motor Club, Newark. W. C. Crosby, of that city, is chairman of the committee, which is authorized to secure counsel and begin proceedings at once. Sufficient funds have been assured by the different clubs that are affiliated with the State body and the best legal talent that is available will be secured. President George Paddock, of the New Jersey Automobile Trade Association, was present at the meting and assured the State body that the dealers would co-operate with the automobile clubs in the proposed fight.

Proposes High Tax on "Rubbernecks."

Running sight seeing automobiles will come high in Buffalo if the Doull ordinance providing for the licensing of them passes. The aldermanic law committee is expected to report favorably on the ordinance. It provides that companies operating such vehicles must maintain waiting rooms for passengers, and must not allow the sidewalks to be used for that purpose. The fee per year is based on the seating capacity—\$1 per seat.

WOULE-BE PURCHASER IS SOLD

Bargain Car all Right in Down Hill Demonstration—Then Seller Gets Away with Cash Deposit.

Convinced that he was the one that was sold, and not the automobile that he bought, Frederick B. Drury, of Barre, Vt., made complaint to the Boston Police which had the effect of landing in the toils a young man named Paul C. Hersey of 3 Copeland street, Roxbury. The charge against Hersey, is specifically, larceny of \$200.

Drury, it seems, thought he ought to have an automobile, and when he saw an advertisment that struck him as being a pretty good bargain, in he came to Boston to put through the deal. The bargain proved to be more than he bargained for. It took him to 18 Lynde street, in the West End, where he met young Hersey, and the machine. All three started out on a trial spin, after Drury had planked down the \$200 as evidence of good faith. His own good faith seemed to be the only faithful part of the deal.

The machine went through its initial paces in right good style. It shot down the hill leading to Cambridge like a thoroughbred that had been cooped up in a stall for a week. When it struck the level, however, the car stopped, but Drury had no suspicion that all was not "on the level," even when Hersey requested him to stand by the machine until he, and his operator could return for some repair tools.

"You wait here until I return," said Hersey; but fortunately for Drury, he did not obey orders to the letter, else he might have been waiting yet, for that was last Tuesday and so far as is known Hersey had not returned up to Sunday morning. Neither had he returned the \$200. Drury waited as long as he thought he ought to then he concluded that he ought to report the automobile deal to the police.

Chicago Club to Aid Law Enforcement.

Good roads and the subject of scorching were thoroughly discussed by the board of governors of the Chicago Automobile Club at their regular meeting held May 8, and it was voted that Claude Seymour, A. R. Stumer, and T. J. Hyman should represent the club at the two days' convention to be held in Buffalo, N. Y. Discussion of scorching brought about a resolution which converts the club into a committee of the whole, each member being appointed a monitor to report cases of reckless driving to the board, which in turn will present the facts to Chief Shippy. It is noted, however. that the board makes a distinction between fast and reckless driving, the resolution defining reckless driving as "driving under conditions such as jeopardizes life, limb or property."

EVOLUTION OF THE ELECTRIC

Churchward on the Advance in Motive
Power Transmission and Control—
The Reduction of "Wattage."

During the last two or three years, while the gasolene vehicle has been making tremendous headway and gaining rapidly in the popular estimation, the electric vehicle has persued a course which has been marked by nothing quite so much as by its even tenor. Because electrics have become wholly practical, and are operated with none of the formality which the highly paid attendant has impressed upon the average owner as being requisite to the other, development has been accomplished with but scant attention on the part of those not directly connected with its production. The factors which have characterized this progress are briefly summarized by Alexander Churchward, whose connection with this branch of the industry has been intimate and of long duration; who also presents some valuable figures on the "wattage" of the present day vehicle, and the considerations which lead to its economy.

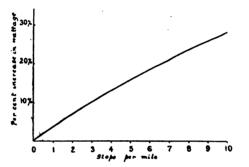

Nearly all of the earlier vehicles of the larger sizes were driven by motors mounted on the rear axle, the method of transmission being usually of the single reduction spur gear type, says Mr. Churchward. In the smaller sizes, such as runabouts, live axles with differentials and single motors were used. In the larger sizes two motors and dead rear axles were used.

The method of control adopted in these earlier types was what is known as the "commutated battery system," the controller changing the connections of various sets of cells from parallel to series, thereby varying the speed of the vehicle by varying the electro motive force impressed on the motor. The main advantage of this method of control was the unequal discharge of the different battery sets when connected in multiple. The mileage of these earlier vehicles was quite low compared with the results obtained from the same size battery to-day, the reason being that the friction, or in other words the "wattage," was excessively high.

It has been shown that motors mounted directly on the rear axle, are necessarily slow speed, comparatively heavy, the efficiency on overloads not high, and the transmission under average conditions not very efficient.

Next in order came the double reduction motor mounted on or suspended from the body of the vehicle, the power being transmitted from the motor countershaft or, in some cases, where slow speed, single reduction motors were used, from the motor shaft to the rear wheels by means of chains and sprockets. The vehicle efficiency of this type of transmission was found to be higher than the direct spur geared type, due to the increased flexibility in the directing mechanism, less weight on driving axle, better distribution of total weight, and the use of a lighter, higher-speed, and more efficient motor.

In 1903 one company placed on the market a new and lighter type of commercial vehicle, the principle features being: Net weight, approximately 0.6 of that of any vehicle of similar carrying capacity; flexible armored wood frame; single motor, roller chain drive from motor to countershaft; double chain drive from countershaft to rear wheels. Although this vehicle in the smaller sizes was capable of carrying nearly its own weight, it was found to be efficient and satisfactory in service. This was due to the great flexibility of the running gear and transmission. Such was the suc-

cess of this type of vehicle that it proved conclusively that the weight could be reduced considerably in all types of electric vehicles, without impairing the efficiency or increasing the cost of maintenance.

Following along these lines, nearly all the standard vehicles to-day, with the exception of some few makes of the heaviest trucks, are equipped with a single motor and double chain reduction, but great improvements have been made by different manufacturers on this single motor type of vehicle. The first reduction roller chain has been replaced by a silent chain-the efficiency of the silent chain at high speeds being much greater than the roller chains. The plain bearings in the wheels are being replaced by some type of roller or ball bearing. Pressed steel frames for the smaller size vehicles and steel channel frames in the larger sizes are so designed as to retain the necessary flexibility and strength without increasing the weight.

Great strides have been made also in the design of motors especially suited to this single motor construction, the efficiency be-

ing increased on normal and overloads many per cent, while all unnecessary weight has been removed without impairing the steep torque characteristics so essential to motors taking their energy from storage batteries.

Another important advance has been made in the design of the controlling apparatus, which has been modified to suit the new conditions. The standard practice today is not to commutate the battery, but to combine the field windings of the motors, with proper shunting and thus obtain a greater number of speeds at higher efficiency that formerly. On all the older types of vehicles the controller used, opened the circuit between controller points, the result being arcing or burning of contacts, and expensive wear and tear on gearing, motor and tires. But in 1904 the General Electric Co. brought on a new controller, which obviated all of these troubles, and increased the mileage, life of tires and batteries.

This controller was so designed that the motor circuit was not opened in any point from the first to the last, the torque on the motor never falling below a certain predetermined value. It is known as the "continuous torque controller" and is applicable to both single and double motor equipments.

Much study has been given by vehicle manufacturers to the reduction of friction or wattage of their vehicles. A few years ago a commercial vehicle consuming 120 watt hours per ton mile on hard level asphalt was considered successful, but lately this limit has been reduced below 100 watt hours per ton mile, and in some cases, under favorable conditions, as low as 60 watt hours per ton mile.

Although the wattage of a vehicle on hard level asphalt cannot be taken as a criterion of what the vehicle will do in actual commercial service, yet it serves as a basis from which all calculations of mileage and traction can be made. The number of stops per mile has a great influence on the wattage of a vehicle, and as the mileage of any vehicle, with a given battery, is approximately proportional to the wattage, therefore the number of stops to be made will directly affect the possible mileage. The increase of wattage in per cent. due to stops is shown in the accompanying diagram.

The wattage is also influenced by the type of tired used. With solid tires of different makes the free running wattage may vary 10 to 15 per cent. on hard level asphalt, but the differences becomes less apparent on

THE MOTOR WORLD

REFINEMENT IN THE CONE CLUTCH

Light and Compact Construction of New "Long Arm" Model-Special Features in Conventional Design.

There is a certain comforting assurance of probable reliability in the use of any adjunct to the car which is known to have been designed along correct theoretical lines, and constructed in accordance with the best conditions of modern practice. On this account the work of the parts specialist may be accounted of especial value, since every article placed on the market is pro-

10 stops per mile.. 37.5 Asphalt 1 % grade. 41.5 Macadam 1 % 38 N. Y. City average 3 5 stops per mile.. 3 On pleasure vehicles some form of pneumatic tire is nearly always used, and there is even a greater variation with different makes of pneumatics, than with solid tires. A vehicle equipped with a single tube cord tire will have a radius of nearly double that obtainable when equipped with a standard double tube tire. Several of the tire companies have designed a special fast low wattage tire, of double tube construction, for use on electric carriages, but, although the radius of action is nearly that of the single tube cord tire, the liability to puncture is as great.

There has therefore been the choice between long mileage (per charge) and the liability to puncture and its attendant dangers, and short mileage and the comparative safety of a stronger tire. Lately a nonpuncturable inner tube has been brought out, and has been thoroughly tested. If this is used in conjunction with a special low wattage outer casing, we then arrive at the possibility of long mileage (per charge of battery) with a comparative safety and low tire maintenance.

From tests lately made, it would appear that the combination of this inner tube and a fast outer casing, does not increase the wattage perceptibly over that of the same casing and an ordinary inner tube.

duced as a specific and not as an incidental effort. An instance in point is the "1909" model cone clutch, which has just been produced in early anticipation of the market by the "Long Arm" System Co., Cleveland, O. It is a compact and very light form of the conventional design. Yet being a special product, there can be no question about accepting it as a trustworthy component of the car.

In detail, the new clutch is much like the previous model. Its features include the large diameter and light, skeleton cone, with its standard angle of 10 degrees, its cork inserts, and friction material of a special grade of leather; its long center bearing, which prevents disalignment and consequent uneven engagement; and its variable tension device, which consists of a split, threaded bushing, which is locked by means of an expander bolt, when properly adjusted. The spring is of liberal size and enclosed, yet readily accessible for adjustment, and one fork of the universal joint is made integral with the driving sleeve, while the transmission is through a dropforged center cross which is furnished with the clutch. Disengagement is secured through the use of hardened rollers, for

which lubrication is provided, and in all other respects the main object of securing a high ratio of power capacity to weight and bulk have been subordinated to conditions governing efficiency of performance. The general arrangement is shown by the accompanying illustration, in which the construction is self-evident. Alterations in diameter, angle and friction surface will be made to specification on large orders.

The Principles of Valve Timing.

To the average motorist the mysteries of valve timing are of no particular interest. At the same time it is well for him to understand the principles upon which it is based, as well as the purely mechanical process by which it is accomplished, sufficiently well to be able to cope with the problem all by himself, should occasion require. In this connection, the most difficult point to understand is why the opening of the exhaust should be advanced, and its closing retarded. Considering the relative rate of piston travel at different points in the stroke, however, there is no real difficulty in understanding even this, as a foreign expert lucidly explains.

"Starting with the commencement of the suction stroke," he remarks, "it is obvious that there is very little downward movement of the piston at the commencement of the revolution of the crankshaft. Therefore, no suction can be set up until the crankshaft has gone through a certain angle (about 10 degrees). Thus it is of no use opening the inlet valve until 10 degrees past the dead center. Similarly no compression can take place until about 10 degrees past the bottom dead center, but the charge from the carburetter has been sucked in at high velocity, and therefore can keep flowing in under its momentum during that period when the piston is practically stationary at the bottom dead center. This accounts for the advantage to be obtained from the late opening and closing of the valves. The early opening of the exhaust valve has been often explained, but its late closing is not so apparent. As there is no longitudinal movement of the piston until 10 degrees after the dead center, and as the inlet valve is not opened until that point is reached, it is generally beneficial to keep the exhaust valve open until the piston starts moving down, so that the exhaust gases, which are under pressure, can be given every chance of escaping."

Naptha for Cleaning Upholstery.

Naptha may be used for cleaning the upholstery of the car when very dirty or greasy. If soiled only slightly equal parts of alcohol or salt and naptha should be used. The proportion should be such that when dissolved the mixture will feel gritty between the fingers. To use this, dampen the material with a sponge and brush over the dampened surface. The soiled spots will disappear and the material change to a fresh look.

NEW YORK'S NEWEST MOTOR CAB

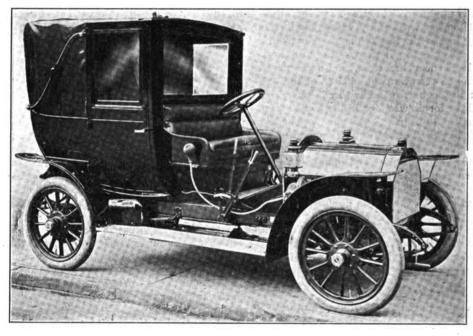

Characteristics of American Locomotive
Model Adopted for "De Luxe" Hotel
Service—Some Original Features.

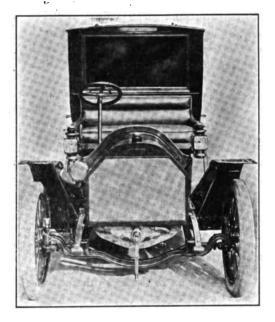

Probably the non-mechanical New Yorker has learned before this that the various types of motor cab now plying the streets of his city in taximeter service may be identified by their color, and has therefore assumed an air of great wisdom by his ready ability to name off the maker of any one of the several sorts now in service. To such

limited by a governor to a rate of 800 revolutions per minute, that the spark regulation is fixed in so far as the operator is concerned, and that the machine is geared to a maximum vehicle speed on direct drive of but 20 miles per hour. The automatic limitation of the engine speed precludes the possibility of any "racing" beyond this rate, either in motor or vehicle.

Interchangeability, which has been mentioned as a distinguishing feature, is conserved by the use of front and rear axle, motor, transmission and steering groups, which may be replaced individually as required, without special fitting or alignment. In most cases, also, this may be done with-

consisting of a large central ring, with tubular extensions at either end which form the housings and supports for the driving stubs. These extensions are ribbed to the central member in such a way as to secure the most desirable distribution of metal at every section. The spring seat and brake anchors are rotatively mounted in this member, their torques thus being transmitted directly to the frame members. The rear end of the driving shaft is carried in a housing affixed to the central body of the axle, and terminating in a torsion tube, which is attached to the chassis by a rotating yoke. The latter, by its method of attachment carries only torsional stresses,

SIDE AND FRONT VIEWS OF THE AMERICAN LOCOMOTIVE MOTOR CAB

a one, some little confusion is likely to result from the appearance of yet another color scheme on the streets, namely that of a dark brown body and yellow running gear. His anxiety may be set at rest quickly, however, by the statement that vehicles answering to this description are the very latest product of the American Locomotive Automobile Co.; that it is built in Providence, R. I.; and that the first hundred of the type are now being put into service, the initial instalment having gone into use last week at the Waldorf-Astoria llotel.

For those who desire to go beneath the paint in learning to discriminate between machines of different makes but of the same general class, considerable originality will be found in the machine in question. It is built exclusively for cab service, and with this in view such points as facilitate interchangeability, prolong the life of the parts, and make the replacement of parts a matter of minutes rather than hours, have been given especial attention.

One of the most striking points in this connection is found in the fact that the motor, which is of the slow speed type, is

out dismounting either of the other organs from the chassis, or even disturbing them in their location.

The significant details of the vehicle are: motor, four-cylinder vertical; cylinder dimensions, 315-16 by 434 inches, bore and stroke; rated output, 16 horsepower; low tension ignition, with Simms-Bosch magneto; transmission, by multiple disc clutch, similar to those employed in the Berliet touring cars; three-speed, selective gearset, the third speed being direct, with a speed reduction of 3.8 to 1; shaft drive, and live rear axle; wheel base 103 inches; tread 55 inches, tires 32 by 3 inches, front and rear; height of frame from the ground, 24 inches; total vehicle weight, 2,600 pounds. Two sets of brakes are provided, as in all well ordered cars, the service set being of the contracting type, while the emergency equipment operates by expanding shoes against the interior of the same set of

The most original, and from the designer's point of view, the most interesting feature of the chassis, is the rear axle and its anchorage. The bridge, or supporting axle is comprised of a one-piece drop forging,

and allows the axle independent movement except in the radial sense, to which it is confined by the tube and also by a pair of radius rods which join the front side of the brake anchor with the frame, and which are articulated on the same transverse center of the chassis as the yoke supporting the torque tube. The live portion of the axle is of the true floating type, and the differential and bevel gearing is enclosed by a light housing attached to the axle, which carries no load. The wheels, of course, are carried on the ends of the axle tubes. An indication of the thoroughness and high class nature of the construction which is employed throughout, is found in the use of annular ball bearings on all journals of the transmission and running gear.

Like the chassis, the bodies are designed and built with special regard to the severe duty which is to be required of them. The woodwork is of seasoned ash, with sheet steel panels, the door mouldings and glass frame fences being of metal. The interior is trimmed with good vaneer, and the glass frames are of polished mahogany. The upholstery is of hand-buffed leather, and the door handles and other fixtures are of brass.

SOLITARY COP OPERATES THE TRAP

Pelham Manor's Short Stretch of Parkway
Costly to Motorists—How the System is Worked.

Because the village of Pelham Manor, just outside of New York City, purposes the erection of a new town building and "needs the money," automobilists passing through on Sundays are "trapped" with unfailing regularity on that portion of the Pelham Parkway lying within the village limits and the experience invariably costs them "\$25 per." At least that is the view taken of the matter by people conversant with the situation. The village controls about 400 feet of the parkway just beyond the Hunter's Point Inn, on the main road from New York to Boston, its jurisdiction commencing at the top of the first incline past the Hunter's Island Inn and indicated by a signboard on the right side of the road. This signboard has recently been changed in that the speed limit is now 12 miles an hour instead of 4, as hitherto. Almost opposite the signboard is a lamppost and from this lamp a course measuring 110 yards has been measured on the sidewalk by the Pelham police, the finishing mark being on a telephone pole on the right side of the road at the foot of the decline.

On Sundays and when traffic is heaviest one lone police officer is stationed about 200 feet beyond the finishing line and it is upon his judgment of the speed that arrests are made. There are no police at the commencement or the finish of the trap. The road curves at this point and a shorter and somewhat dangerous curve is just ahead as the Travers Island club house of the New York Athletic Club comes into view.

The trap is in operation every Sunday afternoon and occasionally in the morning. The automobilists are arrested and taken up into the woods about a mile, held in cash bail for \$25, and the trials generally are set for 6 o'clock on the succeeding Thursday evening.

In a recent trial where the evidence of the policeman was disputed the policeman swore that standing 530 feet from the starting point and 200 feet from the finishing point he could tell within six inches when the cars passed the imaginary line drawn at right angles to those points. The operator and his guest who was seated at his side both swore that their White steam car was going only 11 miles per hour by the speedometer that was in plain view of both, that they had slowed down upon seeing the sign previously referred to, that the power had been shut off and the footbrake set. The policeman, however, swore the car was going 25 miles an hour and that he had jumped on the running board while it was at that speed—a remarkable evidence of agility, if true. In spite of the facts offered in defense the usual fine of \$25 was imposed. It is stated that the measurement of the course has not been checked and that the cop on duty there has not even measured it himself.

Women Establish "Free Rest Room."

As the citizen of the Bowery would say, "pipe" this sentence, from the Palmer correspondent of the Boston Journal, balanced as neatly as any juggler on the Poli circuit ever manipulated twenty cigar boxes, three billiard balls, a piece of chalk and a lighted lamp on top of a billiard cue reposing on his nose: "Henceforth the fame of the town of Palmer will be cherished in the hearts of automobilists as a green, breezy, rippling oasis in a waste of inhospitable burgs with many sassy youngsters shying rocks at the tonneau. squawking hens, lallygagging it across the road exasperatingly near the tires, and farmers retreating in terror to the shelter of the garret at the request of a bevisored, begoggled chauffeur for a 'wet' for his 'whistle' from the well.

"Thanks to the Old Center Improvement Club, composed of ten of the most estimable women of Palmer and always alive to modern requirements, a free rest room for automobilists, the first in America, has been opened here. There is no doubt that it will be popular, for from one end of the summer to the other a continuous file of whizz-chug cars keeps Palmer mummified in dust like an old lost masterpiece of Dante, and there is a perpetual yell from the tourists for a yank at a faucet."

Abilene Claims the "Youngest Motorist."

Infant prodigies make their meteoric appearance in every walk of life, and claims to the title of "youngest motorist" are by no means uncommon The latest claimant for that title is Miss Bessie Coulson, who will round out six years of her life time in June next. She is the daughter of Councilman E. E. Coulson, of Abilene, Kan., and he has so much confidence in her ability to operate his two cylinder touring car that when he reaches home he permits her to take it from the curb, around the corner, where, unaided, she turns and backs it through a narrow door into the garage. She drives through the streets with great skill, her father being with her merely to see that no mishap occurs, and she can bring the car to a stop at the curb as neatly as an experienced chauffeur could do it.

May Attire Motorcycle Cops in Khaki.

Toledo may set the fashion for rational dress for motorcycle policemen by adopting khaki uniforms for the motorcycle squad. The question came before the board at its last meeting and olive drab was the color most favored, as being less likely to show dust and oil spots as quickly as blue uniforms. The new motorcycles required for the use of the squad also were ordered purchased.

NEW DOCTRINE OF RESPONSIBILITY

Astounding Decision by a French Legal Tribunal—Innocent Man Convicted of "Involuntary Homicide."

That a driver may be held responsible. for an accident caused by a vehicle following the one he is driving is the extraordinary legal doctrine set up in a recent decision of the Tribunal of Louviers, a French court. Under this decision a chauffeur named Pouget is adjudged guilty of "homicide through imprudence," and is under a sentence of one month's imprisonment and to pay a fine of 40 francs. The Touring Club de France has decided to appeal the case, which will be reheard before a higher court in Rouen. If such a decision should be allowed to stand, it is thought, the effect would be to make automobiling in France a matter of intolerable risk.

The case arose from an accident which occurred on August 20, 1907, when Pouget and another chauffeur named Fritz were taking to Dieppe two automobiles just purchased by Payne Whitney. When they reached the village of Pis Aller the car driven by Pouget was ahead and he successfully negotiated his way along a street encumbered by a grocer's handcart on the left in charge of a man, a two-horse wagon and a donkey cart on the right, and a dog in the middle of the roadway. Fritz, following Pouget at a distance of about 300 yards, ran over the dog, this accident throwing his automobile to the left, where it crushed the hand cart and killed the man attending it, while Fritz himself was thrown out of his seat, fell on his head and received injuries which resulted in his death that night in a local hospital.

At first an attempt was made to hold Payne Whitney responsible, but that failed and the authorities then proceeded against Pouget, accusing him of "homicide through imprudence," since he had led the way and was responsible for his comrade's attempting to follow. The Court of Louviers accepted this curious doctrine and declared that though Pouget was neither the author nor the accomplice in the death of the two victims, he was guilty of involuntary homicide in not protecting the grocer's man from the motor car following.

Home Made Automobile a "Scorcher."

A Sunday outing which Calvin Bangs of Everett and William Butler of Boston had planned to take in an automobile built by themselves and upon whose construction they had expended about \$800, was prevented by a copper boiler exploding and demolishing the machine. Butler was sitting in the seat at the time, while Bangs was "firing up." In a twinkling the \$800 and their labor "went to hell" as one of the men expressed it.

The Week's Patents.

880,958. Multiple Cylinder Engine. Frank X. Bachle and John C. L. Kress, Clyde, Ohio. Filed June 13, 1907. Serial No. 378,-691

1. A multiple cylinder engine having its cylinders provided with pumping and combustion chambers, said chambers each having a port communicating therewith, a crank shaft and a rotary valve geared to revolve with the engine crank shaft and having a gas supply chamber and a gas distributing chamber, said supply chamber having ports arranged to register at different points in a rotation of the valve with the ports leading to the pumping chambers of the cylinders, and said distributing chamber having two series of ports, one series of which registers with the pumping chamber ports at different points in a rotation of the valve while the other series registers with the combustion chamber ports at different points in a rotation of the valve.

881,026. Spring Cushion for Automobile Tires. John P. Parsons and William Fleming, Pittsburg, Pa. Filed July 6, 1907. Serial No. 382,518.

1. A cushion tire comprising an outer casing inclosing a split annular frame provided with a circumferential recess, resilient means positioned in said recess, an outer split frame supported on said resilient means, an annular cushion carried by said outer frame, and means positioned within said annular frame for expanding and contracting said tire, substantially as described.

881,040. Compressor for Internal Combustion Engines. Harry W. Adams, Fargo, N. D., assignor of one-half to Philip W. Farnham, Fargo, N. D. Filed July 11, 1905. Serial No. 269,154.

1. A compressor having an inlet valve, a conduit for the delivery of compressed fluid, an exhaust valve controlling said conduit, a coil spring for normally holding the inlet valve in its closed position, and a movable member having one surface thereof subjected to the pressure of the gas in said delivery conduit beyond said exhaust valve and for increasing the tension of the spring and increasing the resistance to the opening of the inlet valve as the pressure within said delivery conduit increases.

881,058. Gas Engine Igniter. Albert N. Classon, Rutland township, Lasalle county, Ill. Filed April 20, 1906. Serial No. 312, 800.

1. An ignition apparatus for internal combustion engines, comprising a magneto, an eccentric located upon the shaft of the armature thereof, a vibrator electrically connected to said magneto, binding posts oppositely disposed in the path of the vibrator, an eccentric rod connected to said eccentric and to said vibrator, and a condenser in parallel with said vibrator and binding posts, whereby the vibrator may be positively operated and an alternating current generated.

881,069. Engine Starter. Herbert P. Francis, Oroville, Cal. Filed April 20, 1906. Serial No. 312,806.

1. In an engine starter, the combination of a means for storing energy, a rotary shaft, means connecting it to the engine, a gear in connection with said means for storing energy, a gear in connection with the shaft, an independently rotatable member, a gear carried thereby, and means for arresting the movement of said independently rotatable member at will, said means being automatically controlled by the means for storing energy.

881,102. Anti-Friction Bearing. Walter C. Baker, Cleveland, Ohio., assignor to The American Ball Bearing Company, Cleveland, Ohio, a Corporation of Ohio. Filed April 2, 1906. Serial No. 309,387.

1. A wheel bearing and steering mechanism comprising balls, rollers, or other antifiction devices, one of said anti-friction devices being located within the wheel hub, and within the line of the tread thereof, the other of said anti-friction devices being located inwardly from said wheel, said antifriction devices being of different sizes, and the larger of said anti-friction devices being located in a line with the traction and tread of the wheel, and a steering knuckle located between the two bearings.

881,122. Speed Mechanism. Frederick H. Hodgkins, Chicago, Ill. Filed Aug. 25, 1905. Serial No. 275,035.

1. In a speed mechanism, the combination of a hollow shaft, a slidable shaft in said hollow shaft, a friction member mounted on the hollow shaft and locked to the slidable shaft, driving members mounted on the hollow shaft at the ends of the friction member, each of the driving members having a seat and the ends of the friction member being shaped to engage the seats on the driving members, means for actuating said driving members, means for adjusting said slidable shaft to shift the friction member into operative engagement with one or the other of said driving members, and yielding means to move the friction member out of operative engagement with the driving members.

881,147. Heat Radiating Device. Julian L. Perkins, Springfield, Mass. Filed June 5, 1907. Serial No. 377,351.

1. The combination with the cylinder of a revolving engine, of heat-radiating ribs spirally disposed around the cylinder whereby air is directed around the latter to the rear side thereof, when the engine is running.

881,214. Explosive Compound Engine. Ellis J. Woolf, Minneapalos, Minn., assignor to The Woolf Valve Gear Company, Minneapolis, Minn., a Corporation of Minnesota. Filed March 2, 1907. Serial No. 360,148.

1. A compound explosive engine having its high pressure pisson connected to travel in advance of the co-operating low pressure piston, and a charging chamber subject to compressing action of both of said pistons for forcing a charge into the explosion cylinder, substantially as described.

881,227. Anti-Vibration Device for Automobiles. Charles C. Dodge, Newark, N. J., assignor to The Dodge Lubricator Company, Boston, Mass., a Corporation of Massachusetts. Filed Sept. 1, 1905. Serial No. 276,671.

1. An apparatus of the character referred to, comprising a cylinder, a support connected to the cylinder, means by which said support may be adjusted, a piston in the cylinder, bell-crank fulcrumed on said support and having relatively long and short arms, a piston rod, and means by which the cylinder and the short arms of the bell-cranks may be attached to two relatively movable parts of a vehicle.

881,248. Change Speed Gearing. Hubert Le Blon, Paris, France. Filed Jan. 31, 1907. Serial No. 355,044.

1. In combination, a driving member, high and low speed gears therefor, a driven member, a sleeve therefor loosely mounted

WANTS AND FOR SALE.

15 cents per line of seven words, cash with order.
In capitals, 25 cents per line.

FOR SALE—Or exchange for touring car body, one 1907 Buick M. G. body complete. E. KEELER CO., Williamsport, Pa.

FOR SALE—1907 Pullman runabout or surrey, detachable rear seat, 4 cylinder, 30-35 H. P.; victoria top; Sprague's folding front. Five gas lamps and generator. All metal parts nickel plated. Tires, Goodrich, Bailey tread. Tires and car good as new; car run 900 miles. Reason for selling, have ordered new 6-cyl. Pullman. Car cost new \$3,000; price, \$1,250. Address Post Box 448, Harrisburg, Pa.

FOR SALE—\$100 to \$500 saved. Buy a good second hand car now for next season. Write me to see how much I can save you on others' sacrifice prices. Light touring cars and roadsters, including Thomas, Pierce, Packard and Peerless, and other standard makes from \$640 to \$1,680. C. T. PAXTON, 1200 Niagara St., Buffalo, N. Y.

FOR SALE—300 sets 28x3 best grade artillery wheels, fitted with clincher rims, less hubs. Write for bargain prices on single sets or the lot. THOMAS B. JEFFERY & COMPANY, Kenosha, Wis.

F OR SALE—One new 1907 M. G. Buick runabout body complete. E. KEELER CO., Williamsport, Pa.

high and low speed gears for said sleeve communication with each mixing chamber meshing with said first mentioned gears and for the respective mixing tubes, and means provided with adjacent coupling members, an intermediate coupling member mounted on said sleeve, and means for shifting said sleeve to throw said intermediate coupling member into engagement with either of said loosely mounted gears.

881,273. Gearing. Charles Wicksteed, Kettering, England. Filed Aug. 9, 1906. Serial No. 329.937.

1. In speed gearing the combination of two clutches having a part movable axially into and out of engagement with its co-operating part, a rotatable operating shaft having two eccentric bodies thereon, means for operatively connecting one eccentric body with the axially movable part of one clutch in such manner that rotary movement of the shaft imparts axial movement to the clutch part, means for operatively connecting the second eccentric body with the axially movable part of the sec-ond clutch in such manner that rotary movement of the shaft produces axial movement of this second clutch part, substantially as set forth.

881,279. Carburetter for Internal Combustion Engines. Perry Allen, Flint, Mich. Filed May 31, 1907. Serial No. 376,533.

1. In a carburetter, a casing having an air passage provided with ports in both ends, a gate valve controlling the discharge port, a fuel supply pipe having a plurality of discharge ports facing the gate valve and under the control of said gate valve, a second valve controlling the quantity of second valve controlling the quantity of fuel passing into the supply pipe, and means for connecting the two valves for mutual movement.

881,419. Valve Stem and Tire Deflation Alarm. Abbott E. Kay, Chicago, Ill. Filed Aug. 3, 1906. Serial No. 329,271.

1. In a device of the class described the combination with an inner tube of a stem rigidly engaged thereto and having its inner end approximately flush with the tube, telescoping tubes, one rigidly engaged in the stem and insulated therefrom, the other slidable therein, spring contacts carried by the movable tube adapted to bear against the rigid tube to close a circuit.

881,416. Carburetter. Charles Krebs, Newark, N. J. Filed April 12, 1907. Serial No. 367,820.

1. In a carburetter for gas engines, the combination with a gasolene holder, of a series of mixing tubes, each tube forming a mixing chamber, a feed tube connected with said gasolene holder, said tube extending into and diametrically across each mixing tube, said tube being provided with a series of outlets, each outlet establishing a

connected with each mixing tube having a portion in engagement with the outlets in said feeding tube for regulating the spraying of the gasolene from said outlets, substantially as and for the purposes set forth.

881,428. Engine. Charles V. Martin, Charleston, W. Va. Filed Feb. 26, 1906. Serial No. 303,036.

1. In a rotary engine, the combination with supports, of a fixed crank shaft carried thereby, a casing having ported inlet and exhaust hubs revolubly mounted on the shaft, an annular partition dividing the in-terior of the casing into a central crank chamber, and an annular compartment, cyl-inders supported by the casing and having their inner ends opening into the crank chamber, exhaust valve mechanism ar-ranged in the annular compartment between the cylinders, there being ports or passages through which communication is established between the cylinders and the inlet hub and exhaust valve mechanism, respectively, exhaust valve stems extending into the crank chamber, and means arranged within such crank chamber for engaging and actuating said stems.

881.444. Power Transmission Device. Carl A. Schlachter, Rockwell City, Iowa. Filed June 24, 1907. Serial No. 380,550.

1. A power transmission device comprising a drive member, a vane drum fast thereon, radial seats formed in the drum, vanes in said seats, springs housed in said seats and tending to force the vanes outwardly, and connections between the vanes, and a common actuating member for said connections.

881,460. Magneto for Sparking Mechanisms. Harold H. Brown, Boston, Mass. Filed Feb. 14, 1907. Serial No. 357,380.

1. An actuator for magnetos comprising revoluble armature shaft provided with a radial arm; a member rotatably mounted on said shaft provided with stops coacting with said arm to limit the movement of said shaft and member relative to each other; a spring interposed between said arm and said member; a device for temporarily obstructing the movement of said arm on said shaft and again releasing it; and means movable in the plane of the axis of said shaft for automatically effecting the cessation of such obstructing action when said shaft has reached a predetermined speed.

881,471. Method of Manufacturing and Assembling Ball Bearings. Ernst G. Hoffmann, New Rochelle, N. Y. Filed June 13, 1907. Serial No. 378,699.

The method of manufacturing a ball bearing which consists in forming uninterrupted integral inner and outer rings or race ways grooved respectively on the outer and inner circumierential faces to embrace the balls and prevent lateral displacement thereof when assembled, subjecting the body of the outer ring to an electric heating current while the working face thereof and the inner rings and the balls are maintained at a low temperature, moving the ring and balls relatively in the desired direction at the instant of maximum expansion to embrace or release the balls, and immediately cooling the outer ring to prevent the heating of its working face.

Power Transmission Device. Clarence P. Hollister, Pittsfield, Mass., assignor of one-half to himself and one-half to Herbert M. Stilson, Pittsfield, Mass. Filed Oct. 4, 1907. Serial No. 395,843

1. In a power transmission device in combination, a case fluid-filled and tight, a set of gears located in said case and connected respectively to the engine for power and to the running gear of the car or vehicle for transmission, means providing for and for regulating and controlling the movement of the fluid through the case or impounding the same, and so controlling the power delivered by the engine to and also the speed of the driven member, and parts providing for a frictional engagement or

881,545. Power Transmission Means. John E. Caps and Arthur W. Caps, Kansas City, Mo. Filed Jan. 25, 1907. Serial No. 353,983.

1. In an automobile, a drive gear comprising a frame, a drive shaft, a sleeve loosely mounted thereon, a clutch adapted to hold said shaft and sleeve against relative rotation, a pair of sprockets rigidly mounted on said sleeve, a countershaft, a sprocket rigid therewith and geared to one of said sprockets on said sleeve, a sleeve loosely mounted on said countershaft, a plurality of sprockets carried thereby, a jack shaft, a sprocket carried thereby to which one of said sprockets on said sleeve is adapted to be geared, an idler disposed in bearings movable on the frame, a sprocket chain trained over said idler and over one of said sprockets of said first named sleeve being disposed in the path of and adapted to be engaged by said chain when said idler is moved in one direction and a clutch disposed on said countershaft and adapted to engage said sleeve thereon to hold same against rotation relatively to said shaft.

"The A B C of Electricity." Price 50c. The Motor World Publishing Co., 154 Nassau St., New York City.

Accidents Happen

Nuts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

FRANKLIN Automobiles

Before you buy any automobile see it weighed and test its strength.

Look at the running-cost of a light-weight automobile compared with a heavy one.

You can carry seven passengers in the Franklin Type H automobile cheaper than you can run the ordinary 5-passenger machine. And Type H has six cylinders with all the smoothness and speed and perfect balance they give. Think of it!—a powerful roomy touring-car refined and strong and capable of 55 miles an hour; yet weighing only 2600 pounds, and actually costing less to own and run than the average 5-passenger 4-cylinder machine.

Other seven-passenger machines both 4 and 6 cylinders, weigh on the average, a thousand pounds more than Type H, and cost over 40 per cent. more to run besides depreciating faster. All the Franklin models are on the same principle—high power with strength and light

weight.

The Franklin doesn't bump itself to pieces nor jolt its passengers. The laminated wood-frame and four full-elliptic springs absorb road-shocks. There are no water-cooling troubles. What water-cooled motor could run a solid week with the automobile standing still in a warm salesroom, as the air cooled Franklin did at Chicago? What heavy automobile could run from Chicago to New York in less than 40 hours?

You can't drive a heavy, steel-frame, hard-riding automobile at speed safely and comfortably on American roads.

You're sure of comfort and safety in a light-weight Franklin.

Large Sales

make it possible for us to import THE CELEBRATED BRAMPTON CHAINS from ENGLAND (paying freight and duty), and sell them at the same price at which the several other automobile chains are sold to manufacturers, jobbers,

THE BRAMPTON MOTOR CHAIN

All side plates on both sides on the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement.

THE BRAMPTON CHAIN is made of helf-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material-self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMP-TON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of

A TEST OF PRINCIPLE AND QUALITY

Probably one of the hardest tests an Automobile has ever been put to, has been met by the American entry, A THOMAS FLYER, in the New York to Paris Contest. The front wheels of this car are fitted with Timken Roller Bearings, the hardest service on a car for bearings—but up to the present time has given no trouble or needed any attention.

E. R. THOMAS MOTOR CO., Buffalo:

E. R. THOMAS MOTOR CO., Buffalo:

Gentlemen—It gives me great pleasure to inform you that the TIMKEN ROLLER BEAR-INGS which were used on the Thomas Flyer, which is America's entry in the International Race from New York to Cheyenne, where I had charge of the car. I also believe that they have given no trouble since. These bearings, as you know, are placed where the greatest strain is on them, and it is a considerable pleasure to inform you that I believe the high quality of workmanship and material in your bearings is such, that they must be able to stand up under any and all road conditions, as the strain placed upon them, and in fact the entire mechanism of the Thomas car in this race was most extraordinary, and probably the hardest strain that could be put upon any motor vehicle, either under ordinary or extraordinary circumstances. The highest praise that I can give your bearings is, that I believe that they are fit component parts for the Thomas Flyer.

Yours very truly,

MONTAGUE ROBERTS.

are made to use on all roads, rough or smooth, and represent a special knowledge of load and tractive requirements, with a wearing quality impossible with any other form of frictionless bearings. And that is why over 60 per cent. of all the high grade American Automobiles and 95 per cent. of the Trucks made in this country recognize The Timken Principle Correct and The Timken Quality

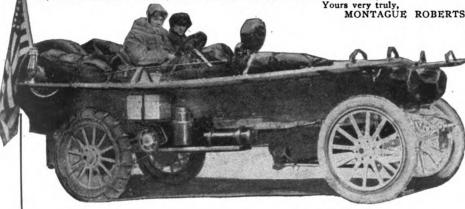

If you are building Automobiles or Trucks we would like to furnish you some data, based on facts that will not only interest you, but save you money.

THE INCOMPARABLE

THE CAR FOR SERVICE

DOUBLE VICT(RY IN HARRISBURG ENI URANCE RUN.

A 30 horsepower White Steamer was the only touring car to make a perfect score in the 320-mile endurance run of the Motor Club of Harrisburg, held May 4 and 5. The White was awarded the principal trophy, the Board of Trade Cup, and also the PATRIOT Cup for which four cars, including the White, tied in last year's contest. Three of last year's successful drivers competed with the same makes of cars in this year's contest and their relative performances decided the award of the 1907 trophy, the White, of course, being the winner.

The contest was run over the rough and hilly roads of eastern Pennsylvania. A 20-mile-an-hour schedule prevailed, with checking stations at intervals of approximately 30 miles. Each car carried an observer, and, in addition, all working parts were sealed. At the conclusion of the run the cars were critically examined by a committee of well known experts.

That the single White entry should have made the only perfect score in the touring car division is significant of the superior reliability and strength of construction of the White. The results of the Harrisburg contest, it should be further pointed out, were the same as in the memorable contest of the Quaker City Motor Club on January 1, 2 and 5, and in last year's struggle for the Hower Trophy, in that the single White entry proved triumphant over a large number of the leading gasolene cars.

Maxwell"

"When My Car Is In Condition,"

Protested a disgruntled driver when his machine had lost a hill-climbing contest to a lower (rated) power Maxwell—"when my car is in condition, I can beat you all right, all right."

The Maxwell man laughed. "I admit it," he said cheerfully—"At least, I would, if I ever saw a car of that make 'in condition."

I was only an innocent—though interested—bystander, so I held my peace.

But I thought, if the man who contemplates buying a car this season could appreciate, as I do, how much that controversy indicated as to the difference between Maxwells and other cars—why! we never could turn out enough to meet the demand even with the addition of our new ten acre factory at Newcastle, Indiana.

"When they are in condition," other cars sometimes defeat Maxwells—one never can account for the spectacular sprint of a "dark horse"—any more than he can depend on a repetition of it.

But the quality that I like in Maxwell cars—the quality that enables every Maxwell owner to wear a confident expression just before, as well as a contented one after, a contest—is that of consistency, certainty, dependability or whatever you may term it, that you can stake your life on.

Maxwell drivers have at their command a known quantity of power and performance and they can rely on repeating, at any time or place any performance done anywhere else with a Maxwell.

"It serves you right"—the Maxwell.

INJUNCTION WITH A STRING TO IT

Court Grants Badger's Appeal and Suspends the Rushmore Judgment—Wisconsin Badger not Involved.

Despite reports that the Rushmore Dynamo Works had obtained a preliminary injunction restraining the Badger Brass Mfg. Co. of New York from marketing the so-called flarefront type of lamp, it transpires that the injunction has a string to it, and as a matter of fact is not now operative.

When the motion for a preliminary injunction was granted in the United States Circuit Court for the Southern District of New York, the Badger company presented a petition for leave to appeal to the Circuit Court of Appeals and praying that the appeal be made a supersedeas. This petition Judge Lacombe granted and further ordered that the preliminary injunction shall not become effective until two days after the announcement of the decision of the Court of Appeals in the case of Rushmore vs. Manhattan Screw & Stamping Works.

The litigation, it is also made plain, involves only the Badger Brass Mfg. Co. of New York, and not the Wisconsin company, who it is authoritatively stated is quite ready to defend any suit that may be brought against them in any court to which they are subject.

Banker's Cash Capital 60 Cents..

Supplementary proceedings in the Chicago Debtors' Court on the 15th inst., developed indications that Albert C. Banker, once head of an automobile business in that city, no longer possesses the wealth which which once he was credited. The Curtin Supply Co. some time ago obtained in the Municipal Court, a judgment against him for \$35, and the proceedings brought in the Debtors' Court were to elicit an explanation of why the judgment has not been satisfied. Banker scheduled his present worldly possessions as follows:

Cash. 60 cents; souvenir watch, value 75 cents; two suits of clothes and one overcoat.

R. H. Smith Mfg. Co. Reorganizes.

Reorganization of the R. H. Smith Mfg. Co., Springfield. Mass., made necessary by the tragic death of R. Hale Smith, former president of the company, has been effected by the election of the following officers: President, Henry M. Smith; first vice-president, Arthur H. Rogers; second vice-president, Frank M. Chapin; treasurer, Henry T. Lorimer; secretary, Frank A. Wakefield. The company will continue without change of name to make Springfield motormeters.

Bondholders Buy Berkshire Property.

When the plant of the Berkshire Motor Car Co., Pittsfield, Mass., was put up at auction last week, it was bid in by a lawyer representing the bondholders. He paid \$50 more than the mortgage of \$28,000. This disposal of the property means that neither the stockholders nor creditors will receive anything, despite the fact that when the Berkshire company first got into trouble it was stated that the creditors probably would be paid in full. The liabilities amounted to \$35,000.

Three New Men in Monarch Affairs.

At the annual meeting of the Monarch Cotor Car Co., in Chicago, last week, three new directors were added to the board, viz.: R. J. Gunning, F. A. Moody, and Rush C. Butler. The old directors re-elected were P. M. Hanney, Evan A. Evans, M. H. Kilgallen, and T. A. Quinlan, Jr. The directors in turn re-elected Mr. Quinlan president and general manager, and J. A. Ward, secretary and treasurer.

Chicago Printers Sue Electric Vehicle.

Two suits were filed in the Superior Court in Chicago on Thursday last to attach \$16,725 of the funds of the Electric Vehicle Co., now in the hands of a receiver. The suits were brought by Rogers & Co. and the Long-Critchfield Corporation, both of Chicago, to collect money for printing catalogues and for advertising.

LOOKING FOR A BIGGER DIVIDEND

Pope Creditors Dissatisfied with Proposed Reorganization Plan—Likelihood of Amicable Adjustment.

Although the petition of the receivers of the Pope Mfg. Co. for authority to pay the creditors a dividend of 25 per cent. is before the courts, it transpires that the creditors do not believe the amount is sufficiently large. They are of opinion that the funds in the receivers' hands justify the payment of at least 50 per cent. of their claims and they are making an effort to obtain it. C. N. Gillett, cashier of the First National Bank of Chicago, who is secretary of the creditors' committee, and as representing that committee, has addressed the creditors with a view of achieving that end by bringing to bear united objection to a plan for the reorganization of the Pope company, which has been outlined by the stockholders.

It appears that a memorandum of this plan was submitted to the creditors' committee at a meeting held in New York on May 6th, which plan proved not satisfactory to the committee. It is understood, however, that within the last few days things have moved in a direction that presages an amicable settlement.

The plan provided for the raising of only \$119,000, being an assessment of \$5 per share on the first preferred stock, and the payment of a 25 per cent. dividend in cash and new obligations of the company for the balance of 75 per cent., payable in one, two and three years, with interest at 5 per cent.

In his address to the creditors, Secretary Gillett, of the creditors' committee, states the case in this language:

"The Pope Mfg. Co. now has on hand, in round figures, \$900,000 in cash, applicable to dividends. By their auditor's figures they will have on hand by August 1, between \$1,200,000 and \$1,300,000. This has been gotten together by the sale of two

properties in Chicago and from the result of their business generally. As the debts of the company approximate \$1,600,000, it will be seen that these figures would permit the payment to creditors of 75 cents on the dollar by August 1, which would leave the properties at Hartford, Westfield, Hagerstown, Cleveland, and Elyria from which to realize, say, \$300,000 or \$400,000. more. This is outside the various other interests owned by the company.

"The committee is emphatically of the opinion that the money now on hand and in sight belongs to the creditors and should be disbursed to them at once unless a proper re-organization plan is presented by the stockholders, providing for the payment of a dividend of at least 50 per cent. to creditors immediately, and the payment of the balance in not more than two years, and providing further for the furnishing of an ample working capital by stockholders, say, \$400,000. Anything materially short of this will amount to a great injustice to creditors under the circumstances of the case, unreasonably deferring their claims and exposing them unduly to the risks of the business. The committee has advised the stockholders through their counsel of its opinion as herein stated, and of its rejection of the stockholders' plans, so far as it is authorized to speak for the creditors on such a point.

"We are advised that the attorneys for the receivers will soon present a petition to the Vice-Chancellor at Newark, N. J., asking that the receivers be allowed to continue the business at Hartford for another year in the interest of the stockholders. Your committee proposes strenuously to object to this and asks for the support of the creditors before the court.

"The Vice-Chancellor has assured us that creditors will receive due notice before any order is made allowing the continuance of the business beyond August 1 of the present year. In all probability there will be an early hearing on the question, at which the committee expects to be represented by counsel and wishes to make a strong showing in behalf of the creditors."

Big Company Goes Bankrupt.

A petition in bankruptcy has been filed against the Empire State Engineering Co., with offices at 149 Broadway, New York, and works at 555 East 116th street, and at Rome, N. Y., by these creditors: National Brass & Copper Tube Co., \$318; Henry F. Peake, \$126, and Frederick M. Kreimer, \$289. It is alleged that the company is insolvent and on May 12 allowed a city marshal to sell some of its property on an execution in favor of the De La Vergne Machine Co. The company was incorporated in March, 1902, with \$500,000 capital, to marufacture electrical devices for automobiles and truck propulsion; over \$100,000 was spent in machinery. The company has a large plant at Rome, against which bonds of \$75,000 were issued.

The Week's Incorporations.

Los Angeles, Cal.—Fuller Motor Car Co., under California laws, with \$75,000 capital.

In the Retail World.

A. A. Webber has taken over from James Cooke the Carterear agency at Los Angeles, Cal. He will handle also the Harley-Davidson motorcycle.

Ortman & Hansel's garage on Market street, Stockton, Cal., was visited by fire May 7th, and although the building was saved two automobiles were destroyed and ten others were damaged.

The American Auto Co., of Cedar Rapids, Ia., have opened a branch office and garage at Iowa City. A repair shop is included in their new establishment.

That pioneer, George H. Lowe, has, with R. S. Crawford, formed the Lowe-Crawford Co., and opened salesrooms at 173 Huntington avenue, Boston. They will handle the Crawford car.

The Paxton Hardware Mfg. Co., of Paxton, Ill., has opened a garage and repair shop in the Cruzen building at East Pells street and Railroad avenue. They handle the Reo and Premier cars.

A new garage for the A. G. Randall Co., of Boise, Idaho, is under construction. The building is one story high and will afford ample room for a mechanical department as well as for garage purposes.

C. J. Durheim, conducting the Muskegon Bicycle and Auto Co., at Muskegon, Mich., is to have a new building two doors east of his present quarters on Clay avenue. It will be of brick with a frontage of 54 feet.

Under the name of the Earlville Garage Co., F. V. Dolder, G. H. Bernard, and E. J. Dolder, of Sheridan, Ill., have purchased the business of W. E. Angier. Hereafter it will be conducted as the Earlville Auto Garage.

A petition to have the Lakedel Auto Co., No. 5143 Delmar boulevard, St. Louis, Mo., declared a bankrupt, has been filed in the United States District Court. The petition alleges that the company has admitted its willingness to be adjudged a bankrupt.

Schedules in bankruptcy of the Kalb & Berger Mfg. Co., repairers, 530 East Seventy-second street. New York, show liabilities of \$7,764 and nominal assets of \$4,825, consisting of stock, \$1,000; machinery, \$2,458; accounts, \$366; an automobile, \$1,000, and cash, \$1.

The Spear Auto Co., of Portland, Me., has been obliged, by the growth of the automobile interest in that city, to open a branch store and repair shop on the water front. They will give attention to the repair of motor boats, in addition to automobile repairing.

The Auburn Motor Car Co. is the most recent accession to Philadelphia's "automobile zone" on North Broad street. The company is composed of F. Liebfried, Jr., and Howard W. Trump. They have located at 441 North Broad street and will handle the Auburn car.

The Fred A. Bennett Automobile Co., of Spokane, Wash., is to have a new garage on Second avenue, between Post and Lincoln streets, a locality that is developing into an "automobile row." The building, which is being creeted especially for their use, will be of brick, one story high and 142x50 feet in dimensions.

LOBDELL AFTER A POPE INTEREST

Receivers Entertain Offer for American
Wood Rim Shares—Court Hearing
Set for That and Other Matters.

E. J. Lobdell, the head of the bicycle wood rim pool, is in a fair way of obtaining a splendid bargain. He has made an offer of \$50,000 cash for the 1,465 shares of stock in the American Wood Rim Co., which are held by the receivers of the Pope Mfg. Co. and which have been carried on the books of the Pope company as of July 31, 1907, at \$73,250. The par value of the shares is \$100.

The American Wood Rim Co. is a part of the so-called Mutual Rim Co., which is the style under which the pool operates. It is a tight little combination which has kept up the price of bicycle rims despite the constant complaints of the bicycle manufacturers. It is practically a monopoly and it is understood that it always has earned a hand-some profit. The combination is practically dominated by Lobdell.

Testifying that the Lobdell offer is the best that has been made for the 1,465 shares, the Pope receivers have asked the Court of Chancery of New Jersey for instructions as to whether or not they shall accept the \$50,000. The hearing on the receivers' petition will be held in Newark Tuesday, May 26, at 10 a.m.

It is ordered that at the same hour creditors and stockholders of the Pope Manufacturing Company show cause why the petition of the receivers for leave to pay a dividend of 25 per cent. should not be granted.

The International Trust Company of Boston must also, at the same time, show cause why in declaring a dividend upon its claims, there should not be deducted the sum of \$9,407.49. This company presented to the Pope receivers claims upon promissory note obligations, aggregating \$75,000, which matured after the appointment of the receivers. At the date of the appointment the Pope Manufacturing Co. had \$9,407.49 on deposit with the International Trust Co., which was not given up, on the receivers' demand.

Times Square Loses Its Suit.

The Bergen County (N. J.) County Court last week decided against the plaintiff in a rather unusual suit brought by the Times Square Automobile Co., of New York against the Rutherford National Bank. John Purdy bought an automobile from the plaintiff last August and gave a check of the Rutherford bank for \$650. A representative of the company went to Rutherford the next day and had the check certified, but Purdy stopped payment, because the automobile he alleged, was not what was represented. The Times Square company maintained that the bank could not

stop payment on a certified check, but the verdict upheld the bank.

Offer for Pope-Toledo Plant Declined.

Toledo has had another paroxysm. Some one named Apperson-not connected with the Kokomo Appersons-made an offer of \$400,000 for the Pope-Toledo plant and the three receivers of the Pope Motor Car Co. -not excepting the Ohio receiver who was appointed at the instigation of disgruntled Toledoans - declined the offer. The Toledo folk who accuse the receivers of having no regard for their city or for the Pope-Toledo property, promptly "threw a fit." The trouble with the Apperson offer was that it was only a trifle of \$200,000 less than the Schwab offer and, like the latter, was made in spoken words and not in writing; and even receivers cannot ask the courts to pass on verbal bids. Whom Apperson represents does not appear to be known.

Remington Stockholders Can't be Assessed.

After six years of complicated litigation, the action brought by the trustee of the long defunct Remington Automobile & Motor Co., of Utica, N. Y., finally has been decided in favor of the defendant stockholders who, by the decision, are relieved from the necessity of paying assessments on their stock holdings, as one of the several verdicts required of them. The history of the company and the story of its short life in Utica has been told at length during the many years that the company's affairs have been before the courts. The final chapter now is written as the Appellate Court's decision is against the trustee, and the time within which an appeal from this decision may be taken having passed, the matter is finally and definitely closed.

Royalty Reduction Case Aired Again.

Additional argument was presented in the United States Circuit Court at Trenton, N. J., on Monday last, 18th inst., on the petition of the receivers of the Electric Vehicle Co. to reduct the amount of royalty exacted of the licensees under the Selden patent, but no decision was rendered. The court took the case under advisement. The feature of the hearing was the appearance on the scene of Job E. Hedges, counsel of the American Motor Car Manufacturers' Association. He represented several minor creditors of the Electric Vehicle Co., and of course opposed granting the petition.

Lunch Boxes Emptied the Treasury.

The Atlas Mfg. Co., Hampton, N. H., which manufactured automobile lunch boxes, is in financial difficulties. Its schedule shows assets of \$9,211.89, and liabilities of \$13,745.

Tryon Named as Receiver for Martini.

James O. Tryon has been appointed receiver for the Martini Export Co., New York, against which, several weeks since, a petition in bankruptcy was fined.

ENGINEERS TO MEET IN CLEVELAND

What They will Discuss and Who will Address Them—Local Factories to be
Visited and Inspected.

In accordance with the policy suggested at the meeting of the Mechanical Branch of the Association of Licensed Automobile Manufacturers, in Chicago, in December last, to the effect that the meetings be held at different points throughout the country, in order to give the engineers an opportunity to inspect and study the different factory methods of its members, the next meeting of the Mechanical Branch will be held at the Hollanden Hotel in Cleveland, Friday, May 22d.

The morning session will begin at 9 o'clock, taking up the subjects of proposed standard brake and clutch levers which has been given a certain amount of attention by the engineers and especially the test committee for the past three or four months. A full report of data gathered by the test committee relative to the dynamometer of the Automobile Club of America will be given and discussed. The report of the dynamometer tests is expected to contain some interesting matter. Papers on the two-cycle motor will be read by E. W. Roberts and A. W. Thompson, of the Electric Welding Products Co. will give an illustrated lecture on the advantages of combination valves, nickel steel heads and carbon steel ends. In the afternoon, and possibly the following day, the local factories will be visited and studied by the engineers in a body.

Trustee Chosen for Shoemaker.

At a meeting of the creditors of the Shoemaker Automobile Co., of Elkhart, Ind., called to elect a trustee, the Elkhart County Trust Co. was chosen for that office much to the surprise of the friends of Wilson Roose, the receiver, who also was a candidate. J. C. Fuller, representing the creditors quietly brought about the result, the vote standing 53 to 17.

McNevin Becomes Sales Manager.

Thomas H. McNevin, who has been acting as the Chicago representative of the Breeze Carburetter Co., has been called to the Newark (N. J.) factory where he will have charge of the sales department. Before leaving Chicago, he placed the Breeze goods with Fulton & Zinke, 1256 Michigan avenue.

Tire Manufacturers to Meet To-day.

A general meeting of the automobile tire manufacturers is due to occur in Cleveland to-day. Their object is to do something to remedy abuses which recently have arisen in the sale of their goods and caused a deal of friction.

Do You Realize What It Costs to Carry Dead Weight?

The man who parts with his good money for an automobile in these days is looking far beyond the first cost of the car. He wants in the first place to pay no more than a fair price for his car, but his real point of investigation is the cost of maintaining it after he has purchased.

The Oakland is made for this man.

It is designed and built for the man who runs but one car. It is made for the man who wants a car that is big enough to take his family out for a ride, and not too unwieldy for daily use about town when engaged in business.

It has all the power, style, and comfort which the exacting motorist is right in demanding, but the whole design and purpose of the car is to give the utmost value and the greatest service for the least possible expenditure.

How the Oakland Cuts Down Maintenance Costs

The Oakland car has been so refined in construction and design, with the number of working parts reduced to a minimum, but it weighs from 500 to 1,000 pounds less than other two and four cylinder cars of equal horsepower.

Aluminum is used freely throughout in its building, and it has less adjustments and working parts by over 50 per cent. than other cars of equal power and capacity.

The prompt and silent motor delivers through its straight line drive shaft full 20 horsepower to the rear axle.

The Oakland motor is a triumph of automobile designing—a two cylinder vertical motor that is perfectly balanced and free from vibration.

In appearance, performance, and cost, this is the car that most completely meets the demands of the discriminating buyer. It is an unusually good proposition for the better class of agents. Will you write to-day for further information?

NEW YORK, JUNE 4, 1908.

The A. C. A. and Its Workings.

"Lest we forget," and before the affair is made appear what it is not, i. e., an embroglio over the Vanderbilt cup rules, it is well to point out (1) that despite its present untenable attitude, the very fact that the Automobile Club of America, so-called, was until two months ago a member of the New York State Division of the American Automobile Association, is proof that it recognized what every one else in America recognizes, that is, that it is a purely local club without national authority or functions; (2) that it "got mad and refused to play" and withdrew from the A. A. A. not because of the Vanderbilt cup rules or any other after-excuse, but because it could not dictate the legislation for all of New York State, the legislation which it sought to impose involving (1) license fees up to \$40 per year; (2) fines up to \$1,000; (3) revocation of the citizens' right to the use of the common roads and, substantially, confiscation of his private property. The Automobile Club of America (of New York) performed one other service of doubtful benefit to American interests and that serves further to doubtfully endear it to American hearts: Its foreign correspondent committed the manufacturers and sportsmen of this country to a rule restricting sport to four-cylinder cars, thus effectually barring "sixes" and "doubles," of which there are many in America.

The State of the Trade.

To that oft-repeated and frequently embarrassing question-How's business? a variety of answers may be given, according to the depth or superficiality of the respondent's reasoning. If the question were asked in regard to the condition of the automobile industry at the present time, and answered in full knowledge of existing conditions, the reply would be without qualification, "Good." It is a general principle based on sound reasoning, that the bulk of business favor inclines to the firms which make the most consistent and forceful effort to secure and retain it, just as the compass needle points to the strongest pole in its field regardless of the number of other poles which may influence its position.

Those makers who have been building cars with the clear idea in view of catering to a certain class of customers; who started in with ample resources and skill at their command and have adhered to first principles with fidelity and concentration of their energies; those who have built their cars thoroughly and well; are the shining lights in the field to-day who are more or less subject to the envy of their less successful competitors. They are the established and reputable makers who even in times which otherwise may be reckoned as comparatively dull are reaping the harvest which their far-sighted policy has merited.

This in itself constitutes a reply to the shallow reasoners who decry from time to time the "runs" on various popular brands of car, and even hint at the eccentricities of popular favor. Quite to the contrary, the popularity of any given machine extending over from season to season must be taken as an indication that it is coming into a position on the market which it truly deserves; that its makers are receiving a just reward for their efforts. At no time is the effect of such popularity more evident than

during and immediately after a period of business depression. It requires a crisis to emphasize to the men in the trade the facts which have been patent to outsiders to develop the prestige of real worth.

In the broadest possible sense, people have been buying automobiles hitherto. Now it has become necessary to sell them. The demands upon salesmanship are greater than ever before, the "selling points" of the products have taken on new importance, the real worth of the car in distinction from its superficial attractions has become paramount. All this means a reorganization of selling methods, an overhauling of selling forces and the dolorous elimination of many petty men in pretty clothes whose actual value to the industry has been discovered in connection with the overturning of the former systems of administration.

Such changes are continually taking place—some with visible result, some more subtly. Certain firms are finding the market constantly improving, while others experience conditions which are just the reverse. It is a process of gravitation, permitted to take place now that the turmoil of the formative period of the industry has in a measure subsided. The results of real business ability and faithfulness to a wisely chosen policy are beginning to be distinctly manifest, and where this is the case, it is found to be true that business is indeed very good.

Prices and Reasons Therefor.

It always is difficult to reconcile a certain class of buyers to the high prices asked for the certain grades of goods. In the automobile industry this is particularly true with regard to the cost of some of the more expensive cars. But though the layman may not be able to appreciate it, there is a legitimate difference in cost between cars which are apparently alike in design and construction, which is easily accounted for by expenses due to the administration of the plant where they are produced, and is fully justified in the performance of the vehicle.

Thoroughgoing inspection of every part, extending not simply to the independent components, but repeated after they are assembled, constitutes an element of expense which is by no means inconsiderable in comparison with the total cost of producing the car, and which also more than pays for itself in the long run. The use

of high grade materials taken, not upon trust, as it were, but upon the expert recommendation of specialists in the employ of the maker constitutes another item of producing cost, not apparent in the product. The maintenance of chemical and physical laboratories for the purpose of qualifying every item of stock used in the car is no mean factor in building the high price of a first-class car, nor in contributing to the value which that price ensures.

Again, the treatment of these high grade materials by high grade processes demands a big plant and skilled operatives. Systems must be worked out, provision made for attending to every little detail in a thorough and practical manner. Systems ensure successful results, but they are expensive. It costs a good deal just to run the establishment which is equipped to turn out really excellent cars in significant numbers.

These various items are entirely in excess of the costs involved in producing cars along less conscientious and restricted lines. They multiply with great rapidity and mount up to an astonishing degree. That this addition to what might be called the basic cost of a car of certain stated specifications is a legitimate addition-that it is repaid in lower depreciation, increased serviceability and reduced cost of maintenance, is proved in a goodly number of concrete examples of such first class productions as have rescued the name of the American manufacturer from the reputation of shoddy workmanship which it used to hold among motor car builders and owners the world over.

High selling cost is not in itself a criterion of merit in motor cars any more than it is in furniture or clothing or tinned meat. The purchaser in order to invest wisely must exercise a certain amount of discrimination founded on the nature of the machine and its reputation. But he must be made to understand that there is a proper reason for the high price asked for really high grade cars.

The Anti-American Program.

The action of the disgruntled Automobile Club of America, of New York City, in deciding to conduct a race for foreign cars on American soil in opposition to the Vanderbilt cup contest immensely simplifies the situation.

It will range on one side all those who are of America and for America and Amer-

ican institutions, and on the other side all those who are against them.

The more-than-ever misnamed Automobile Club of America, so long dominated by an alleged American who is, or tries to be, Frenchier even than a Frenchman, is but proving true to its previous inclinations. It stands as the best friend the foreigners and foreign manufacturers ever possessed on this side of the water. It is no wonder that the foreign organizations have fallen over themselves in making haste to applaud the stand of the A. C. A. Not to do so would be to be guilty of the blackest ingratitude. Next to the Automobile Club of America, the "lovliest" specimen of American sportsmanship is disclosed in the Savannah Automobile Club, which wants a race so badly that it will turn any sort of a flip-flop, or carry water on either shoulder, or train in any old company in order to obtain it. If the Automobile Club of America's Hessian race on Georgia soil proves as successful, financially and otherwise, as the foreign shows that were held in New York, the Savannah club will reap its just reward.

With the issue so dearly defined and the line so sharply drawn, the American sportsman or American manufacturer who lends countenance to the A. C. A.'s mischief-making program deserves to be viewed askant. He is either hard pressed to obtain undesirable glory or doubtful publicity. It is perfectly plain that all who compete in the A. C. A. contests thereby will become "outlaws" of sport. The number of such "outlaw" movements which have succeeded can be numbered on the fingers of one hand without counting the thumb, and if the support of even the bemillioned head of the steel trust, prompted by men with grievances and bolstered by salaried employes who must needs find work to do, can establish the A. C. A. brand of outlawry, it will be strange indeed. When such movements peter out, usually, the only men who suffer are the misguided dupes who merely serve as the chess-pieces for the disgruntled chieftains. So far as concerns automobile sport, there are so many poor devils who are not their own masters, and who must needs compete when ordered to compete, or lose their jobs, that the A. C. A. breed of outlaw will be more pitiable than usual. The head of the steel trust might at least start a pension fund for the poor fellows who "don't know where they're going, but who are surely on the way"-to

COMING EVENTS

June 4, Trenton, N. J.—Mercer County Automobile Trade Association's 200 miles sealed bonnet reliability run.

June 5, Jamaica, N. Y.—Long Island Subway Celebration Committee's one mile record trials on Hillside avenue.

June 6, Williamsport, Pa.—Williamsport Automobile Club's hill climbing contest.

June 6, Worcester, Mass.—Wörcester Automobile Club's annual climb up Dead Horse hill.

June 9, New York City—Orphan's Day Automobile Committee of New York's annual parade of orphans.

June 13, Cleveland, Ohio—Cleveland Automobile Çlub's annual hill climb.

June 13, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

July 15, Huntington, N. Y.—Huntington Automobile Club's carnival and races.

June 18, Washington, D. C.—Washington Lodge of Elks' race meet at Bennings track.

June 24, 25, 26 and 27, Chicago, Ill.—Chicago Motor Club's 1,200 miles reliability run to Dixon, South Bend, Joliet and Chicago.

June 24, 25, 26 and 27, New York and Philadelphia—Monroe County Automobile Association's dual reliability run to Stroudsburg, Pa., and hill climbing contest and carnival at Mount Pocono.

June 27, Norristown, Pa.—Norristown Automobile Club's hill climbing contest on Skippack hill.

June 30, Rockville, Conn.—Rockville Automobile Club's hill climbing contest on Ned England hill.

July 3-4, Wildwood, N. J.—Motor Club of Wildwood's annual automobile carnival.

July 4, Cape May, N. J.—Quaker City Motor Club's race meet and carnival.

July 4, Lowell, Mass.—Lowell Automobile Club's 250 miles road race on Merrimac boulevard.

July 9. Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

have the brand of spurious sportsmanship placed on their backs.

The spectacle of a big club, officered by grown men, so plainly acting first the part of a small boy who "won't play," and then the part of dog in the manger, is a spectacle not often afforded.

EXCITING SPURTS UP SPORT BILL

Poole Breaks Records at Bridgeport's Annual Climb—Coffey's Daring Drive—
Thrills for 10,000 Spectators.

Breaking all records for the course "Al" Poole, who first became known as the mechanic of Joseph Tracy, and who later was given a wheel position on a foreign car, won and received just as many cheers when he piloted his Columbia car across the finish line in 1:194%. Coffey's splendid driving and the reckless abandon with which he slewed around the curves were bright features of an unusually well-managed and exciting hill climb.

To begin with there were something like 10,000 people out to see the cars scramble uphill, and despite the immense human outpouring there was not the slightest trou-

of the Sport hill climbs, and the Bridgeport Club deserves more credit than usually is given to promoting organizations, for the admirable manner in which all the minutest details were attended to. Referee A. L. Riker was about the busiest man at the course and—his face was clean. Not that this is an unusual thing with Mr. Riker, but the Locomobile's designer had spent several days on the course superintending the oiling of it, and as many times he had to

3. SCHNE AT THE FINISH

the Board of Trade cup and scored the fastest time of the day in the third annual hill climbing contest promoted by the Automobile Club of Bridgeport, held on Sport hill, Easton, Conn., last Saturday, 30th inst. Poole covered the mile of stiff grade, studded with treacherous hills, in 1 minute 17 seconds, lowering by 7½ seconds the record made over the same course last year by Tracy. Without taking any credit from Poole it can be said that John J. Coffey. of Hartford, earned just as much glory

ble in keeping the course clear for the racing machines. Due to the business-like methods employed by the Fourteenth company of the Coast Artillery, which patrolled the course, this part of the program left nothing to be desired. The crowd seemed to respect the uniformed soldiers with their rifles and usually a request was sufficient. The politeness of the guardsmen was a sharp contrast to the irritating officiousness that marked the late Briarcliff race.

The third annual was the most successful

jump in and assist in the work, by Friday night his face looked as if he had driven through a cup race over oiled roads. After the finish of the meet on Saturday Riker was noticed loading a big car with camp chairs like any \$2 a day truckman. The only man that didn't overwork on Saturday was good-looking Ralph M. Sperry, chairman of the contest committee. Sperry was snugly entrenched on the bank near the "S" turn. It may have been the fact that he wasn't alone that caused him

to look so happy, for it is a fact that he was entirely oblivious to the passing of the sputtering record-breakers, but as Sperry had worked early and late on the preliminaries he was entitled to a day off.

An effort was made to separate the spectators from their loose change by charging \$1 for grandstand seats at the finish, but when the events were half over and the price had come down to 25 cents there still were no takers. One man who had a parking space below the starting point didn't catch a victim either. The only people that made money parking cars were those who rented space for the benefit of the painting fund of the Easton Methodist church. Judging from the sale of \$2 spaces the church will get two or three coats of protection against the elements.

The crowds began to assemble at the course from the first peep of dawn and although the fog-blanketed hills gave rise to dubious forebodings there were at least 10,000 people at the course when the first event was started at 8:30 o'clock, and from then until noon there were no tiresome waits. While of course, there were crowds at both the starting and finishing points the largest collection of spectators was massed at the double "s" curve half way up the incline. This was the danger point, but as is usually the case when accidents are looked for, they characteristically refused to happen. Of the many spectators who reached the course in their own conveyances, not all came in motor vehicles. There were many horse drivers present and they lined up with their teams at various points of vantage.

It was just 8.30 when the starter gave the word to W. Pollard, Maxwell, in the first event, for cars selling at \$850 and under. Pollard climbed the hill in 2:05%, and Frank Dunnell, Ford, who followed, was timed in 2:33. The Maxwell was protested but later it was withdrawn. These were the only two starters and in the eventwhich followed, for cars listing between \$851 and \$1,250, there were the same number, the event going to Brockwell, who drove an Overland to the finish line in 1.431/5. Robert Burman, Jackson, won in the class for cars listing between \$1,250 and \$2,000. C. B. Tiley, in a car of his own construction, had a walkover in the \$2,001 to \$3,000 class.

The first excitement came in the runabout class from \$2,001 to \$3,000. Up to that time the drivers had been exercising great care, particularly on the double "S" curve, but when Harry Tuttle cut loose and covered the distance in 1:29, the succeeding drivers took heart and let their cars out all the way. The excitement began to increase in the class for cars selling at \$4,001 and over, which was for the H. D. Miller cup, and when Poole scurried up the incline in 1:20 the crowd cheered him. This was the fastest time in the event, and the best performance up to that time. Poole's Italian car was protested,

however, the claim being made that it is, not a stock car and the cup is held up pending a comparison of the catalogue specifications with those found by the contest committee. If Poole is ruled out the cup will go to C. F. Alcott, Stearns, who made the next best time of 1:23.

Young Kenneth McNeil, a son of Senator McNeil, got a big hand when he started in the amateur class for the Craufurd cup. McNeil handled his car like a veteran and captured the cup easily in 1:203/2. J. Doig in the same kind of a car was second in 1:22.

Naturally the most interest centered in the free-for-all, in which several big cars had been entered, including the winner of the Briarcliff eup race. It failed to show well, however, making the next to the slowest time in a field of nine starters. Eltridge, the driver, said a gracked admission pipe slowed his time considerably. The event went to Poole, who covered the uphill mile in 1:17. However sensational Poole's run was, Coffey's was even more so. Coffey drove a light Columbia, stripped "to the waist," and its lightness caused the spectators some uneasiness on the whirlwind run. At the first turn just beyond the start were gathered some 200 spectators and most of them had crowded up to the guard rail. The stripped Columbia skidded badly at this point and there was a rush away from the spot, until Coffey had passed in safety. At the double "S" turn Coffey gave the crowd another scare, but he continued without slowing down and as a result finished only 21/5 seconds slower than the imported winner of twice the horsepower. William Watson, in the Briarcliff Simplex, was third in 1:203/5, and popular Harry Tuttle, Stoddard-Dayton, finished fourth, his time being 1:213/5. The sum-

Endurance Run to Benefit Orphans.

At a meeting last week of the Automobile Club of Hartford, Conn., it was decided to use the funds accruing from the endurance run for the purpose of giving an automobile outing to the children of the Hartford Orphan Asylum and kindergarten for the blind. As the club's endurance run was never intended as an event from which to earn a profit it was thought that no better use could be made of the funds than to utilize them in this way. So on June 13th, fifty automobiles loaded with children will run to some nearby park where a picnic will bring happiness to the little ones.

Connecticut Clubs May Amalgamate.

It is possible that the New Britain (Conn.) and Hartford Automobile Clubs may amalgamate. At a recent meeting last week of the New Britain club the question of consolidation was discussed, and it was determined that if the local club should not develop greater strength it would be advisable to join with the Hartford organization under the name of the Automobile Club of Hartford County. At the meeting it was decided that unless the right man can be found to build up the club, the consolidation will be effected.

Rockville Organizes a New Club.

An automobile Club has been organized in Rockville (Conn.) The officers are: President, George E. Sykes; vice-president, William Maxwell; secretary and treasurer, Lebbens Bissell. The club probably will hold a hill climbing contest during Old Home week.

Granville Club Effects Reorganization.

The Granville (Vt.) Automobile Club was reorganized last week, electing the following officers: President, F. T. Pember; vice-president, Dr. J. H. Collins; secretary, E. W. Wyman; treasurer, H. Van Derwater; corresponding secretary, Mrs. Charles Mosier.

"COING SOME" UP GIANT'S DESPAIR

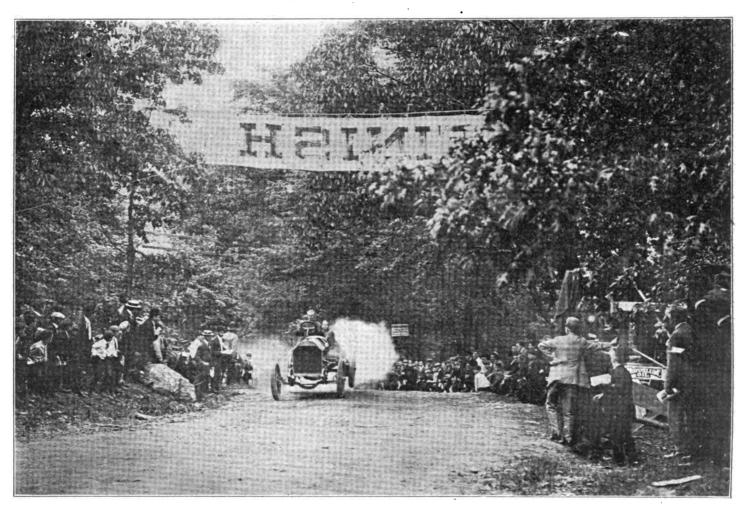

Wilkes-Barre Hill Climb Marked by Thrilling Contests and Broken Records— Haupt's Marvelous Time.

Despite moist leaden skies and a shower which fell after the sport had commenced, a monster crowd numbering about 40,000 witnessed the annual hill-climb up Wilkes-Barre Mountain, sometimes known as

When it is considered that the course rises 690 feet in a mile, that it has a grade of from 10 to 23 per cent., and that it is a continuation of zig-zaggy double "s" curves from start to finish, it will be seen that 1:38% is "going some," and following this line of reasoning it is not surprising that the Wilkes-Barre miners could not suppress a cheer when Haupt skidded around the oiled curves on two wheels.

The meet was filled with thrills, but fortruately there were no serious accidents to left in the event. These were Bitner's Rambler and Lengle's Acme. The latter won easily, but was protested, the claim being made that the Acme had no stock catalogued at less than \$3,000, whereas this class was for cars under \$2,000. Then to keep the protest ball rolling, Gilbert H. Smith protested the Pennsylvania Vanderbilt car in the event for cars between \$2,001 and \$3,000. The justice of the protest was admitted and the entry was withdrawn.

To add to the complications, many en-

WILLIAM HAUPT (CHADWICK) LITERALLY BOUNDING TO VICTORY-REAR WHEELS IN THE AIR

Giant's Despair, on Saturday last, Decoration Day, the meet was attended with as much success as the successful event a year ago.

The meet was marked by the breaking of several records made in the last climb. William Haupt, a Philadelphia young man who piloted a six-cylinder Quaker-made car was the hero of the day. He won the free-for-all and then in a special time trial covered the 6,000 feet of winding mountain road where the grade at one place is 23 per cent., in the marvelously fast time of 1:38%. This is at the rate of more than 41 miles an hour. The best previous time, 1:494%, for an automobile was made last year by Walter C. White, while the record for the course stood at 1:40, made by a monster 14 horsepower motor bicycle.

the cars and no person was injured among the drivers or spectators. The course was in excellent condition.

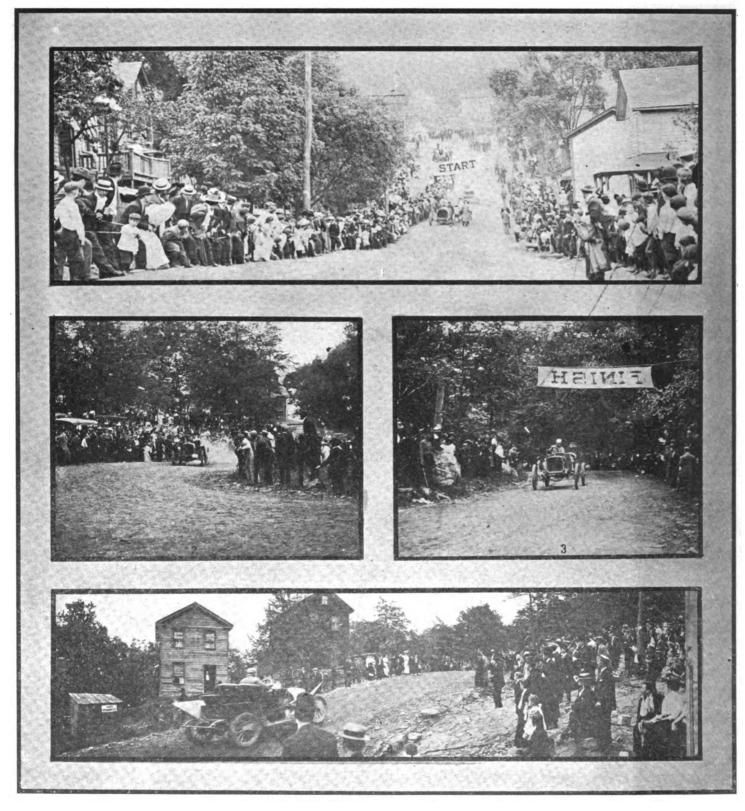

A. A. Jones, in a Ford, started the ball rolling in the event for gasolene cars under \$850, and he reached the summit, Prospect Rock, in 3:1936. After Jones had made his climb a crowd of about a thousand persons poured onto the road from an excursion train and delayed proceedings for a while. Charles Fleming, Maxwell, then made the run in 3:2236.

The fun began after Jones had trimmed Fleming, and R. Jackson enjoyed a walk-over in the second event. With the calling of the third event the announcement was made that the Corbin had been scratched, and when Berger stalled his Oldsmobile at the Devil's Elbow turn there were only two

trants were inclined to question the right of the referee to award medals in two classes where there was but one entrant, who was thereby assured of a walkover. Later the announcement was made that the promised first prizes would be awarded to the walkover participants.

At this point it was announced that the free-for-all would be held and a mix-up was occasioned that kept the Stoddard-Dayton out of the open event for cars between \$2,001 and \$3,000. The driver was informed that the event was to be postponed and so he left the course. When Referee Morrell changed his mind suddenly, as he frequently has been known to do, and ordered the events to be run according to schedule there were only two starters ready for the event, a Thomas-Detroit and a Corbin. It went

- 4. WHIRLING AROUND A SHORT CURVE

to the former in 2:1915. The next event was a welkover for S. H. Hancock; and C. A. Ward, Matheson, got a medal just after in the same manner.

Interest began to increase in the event for six-cylinder cars when Hancock ran his Stevens-Duryea up the hill in 2:08½, and Haupt followed in 1:5735. Here was a real contest at last, and it proved to be when Robinson in the big Stevens romped up in 1:52, the fastest time up to that point, breaking the record for gasolene cars made last year. The free-for-all brought out two or three big cars and Haupt in his

Great Chadwick, ran away with the race in 1:41%. Just as much interest centered in the race for cars of the Briarcliff type and this was one of the closest contests of the day, John Downer, in a Corbin, winning a popular victory when he defeated Hoffman in a Stearns, by 2½ seconds.

Haupt made his sensational run in the time trials when he covered the distance of more than a mile in 1:37%. C. A. Ward, in a Matheson "Big Six" set out to put Haupt's performance in the shade, but a flat tire caused him to ditch near the Devil's Elbow. The various sections for the Quaker City drivers were won by Marriott, Stanley; Longstreth, Maxwell, and Zengle, Pennsylvania. The summaries:

CEDRING'S UNDERSTUDY A WINNER

Brown Makes Fastest Time in Yale Hill Climb — Swan Makes Next Best Times in Three Events.

David Bruce Brown, a young New York amateur who has been understudying the late Emmanuel Cedrino, made the fastest time in the hill climb conducted by the Yale Automobile Club at the Shingle hill, near New Haven, Conn., Wednesday of last week, 27th ult. Brown covered the mile incline in 1:06-1/5, in the class for cars with cylinder capacity between 400.1 to 550 cubic inches. Cedrino who, a few days later was killed in an accident at Baltimore, rode as his mechanic and was to have driven the Fiat car in the free-for-all, but a mishap put him out of the running.

The Yale meet was one of the best ever held in New Haven; it attracted about 5,000 people to the rock-bound course. Every car was at the tape on time and after the first delay, when the spectators crowded on the course and were only cleared off when it was announced that the contest would be called off unless the road was cleared, everything proceeded without a bitch

The first event was for cars with cylinder capacity up to 200 cubic inches and this was won easily by T. C. Walker, Ford. W. A. Burke, Knox, scored a popular victory in the class for cars with cylinder capacity between 100.1 and 400 cubic inches, when he romped up and around the three curves in the fast time of 1:121/5. The nearest approach to this time in this event was made by H. Tuttle, Stoddard-Dayton. In the free-for-all, Burke ran a close second to W. W. Swan, whose Stearns was timed in 1:10. Burke's time was 1:113/5. Swan won the class for big cars in 1:15%; J. S. Joyce, Locomobile, was second. W. A. Maynard drove a Thomas Forty to victory in the class for touring cars, fully equipped, having a cylinder capacity not greater than 550 cubic inches. J. W. Matthews, Stevens-Duryea, was second in 1:321/5, and R. B. Stern, Fiat, got third place.

Mischievous Kids Kid Motorists.

Two New York youths whose combined years were about equal to the number necessary to arrive at the age of discretion had a lot of fun with automobilists one evening last week. They stationed themselves in the shadow of a tree on the driveway to Coney Island and whenever a car or motorcycle passed that was going even a little bit, one of the jokers blew a shrill blast on a whistle and they found their amusement in watching the effect. As the conspirators were in the dark the motorists could not see that they were being hoaxed, and fearing that they were exceeding the speed limits they immediately slowed down.

First Air Cooled Car at Brooklands.

What evidently is to be considered as something of an event, will be the first appearance on the Brooklands motordrome of the first air-cooled car to be raced on the huge course, which is to occur shortly. It goes almost without saying that the machine to receive this distinction is of American manufacture. It is a Frayer-Miller belonging to Jack Darwen, of Bromley.

Bliss at Head of Malden Club.

At its annual meeting the Malden (Mass.) Automobile Club elected the following officers: President, Alvin E. Bliss; vice-president, Willard E. Robinson; treasnrer, Albert B. Tenney; secretary, Herbert A. Gidney; board of governors, L. L. Libby, R. C. Guptill, Philip V. Mingo, John B. Robbins, W. S. Hopkins, G. E. Hanscom, J. W. Maguire.

PIMLICO MEET A DISAPOINTMENT

Walkovers and Runaways Characterize the Events—Fence Plunging Act in 100-Miles Race the Only Thriller.

Whether it was the unfortunate accident to Cedrino the day before, or just because the events were rather uninteresting, or both, at any rate something put a damper on the meet conducted by the Motor Car Racing Association at Pimlico track, near Baltimore, on Saturday last, 30th ult. To be sure, the crowd was large, numbering about 5,000, but they did not warm to the events, most of which were uninteresting runaways. One fence-plunging act, entirely impromptu, and the excitement afforded by a good motorcycle race, were the only features to partly repay the large crowd for the money it had expended.

In the first event, for stock touring cars selling from \$2,000 to \$3,000, there were only two starters. One of them broke down in the first mile, leaving the other to finish the remaining four miles alone. In the second event, a so-called Maryland runabout championship, there were three starters, but one of them lost a tire in the first mile and the other fizzled discouragingly so that there was only one car going fast at the finish. In another race at five miles only one car started and, of course, this was highly interesting. In the 10 miles handicap the scratch car caught the long markers in three miles, loafed behind them for three miles more and then came through and won by a mile.

The only events resembling races were the motorcycle handicap and the 100 miles "championship" for stripped cars, but as the winner in this latter event led from start to finish and finished 19 miles ahead of the second car, it cannot be said that this race was terribly exciting. The one bit of excitement occurred in the latter minutes of the race when J. S. Price, Acme, plunged through the fence, following the bursting of the right rear tire. Lineau, the mechanic, was thrown out, but escaped with a slightly cut chin, while Price was not even unseated, bringing his car to a standstill. E. L. Leinbach finished first and Robert Morton second, third place being awarded to Price.

As usual, the motorcycle race furnished the interesting part of the program, and the event would have been closer had not the starter held "Chic" Thomas, the scratch man, considerably longer than was necessary. The result was that Matthew Gault, on a five horsepower twin Indian, rode so fast that Thomas could make but little gain on him. Gault soon left Cook, his co-marker, behind, and then started after the long markers, passing the last on the turn into the stretch of the last mile. His time was 6:31. The summaries:

Five miles for stock touring cars selling from \$2,000 to \$3,000—Walkover for A. L. McCormick, Oldsmobile. Time, 6:21.

Ten miles for Maryland runabout championship—Won by Robert Morton, Pullman; second, Charles B. Kirkman, Pullman. Time, 11:454.

Five miles for cars from 40.1 to 60 horse-power, inclusive—Walkover for E. L. Leinbach, Stearns. Time, 5:31%.

Ten miles free-for-all handicap—Won by E. L. Leinbach, Stearns (scratch); second, Robert Morton, Pullman (23 seconds); A. L. McCormick, Oldsmobile (45 seconds), third. Time, 11:07.

One hundred miles championship for stripped cars—Won by E. L. Leinbach, Stearns; second, Robert Morton, Pullman; third, J. Price, Acme. Times, 2:00:47 and 2:30:47.

Five miles motorcycle handicap—Won by Matthew Gault, Indian; second, W. F. Fisher, Indian; third, Chic Thomas, Indian. Time, 6:31.

Two New Clubs in Minnesota.

In the last two weeks two new automobile clubs have been added to the roll of the Minnesota State Automobile Association and the American Automobile Association. The Brown County Automobile Club and the Kenyon Automobile Club have been organized and have affiliated with the State and the National organizations. The officers of the Brown county club are: President, Dr. O. C. Strickler; secretary and treasurer, H. G. Bingham; board of directors, Dr. E. Mueller, Henry M. Somsen, W. G. Frank, Ernest Aatternott; state director, Joseph Bobleter. The officers of the Kenvon club are: President, Dr. E. H. Marshall; vice-president, R. Leland; secretary and treasurer, Jay H. Held; board of governors, Albert Molin, Dr. A. J. Gates, E. G. Held, and N. W. Fox; state director, Arthur Bulong.

Physicians in the Oranges Form a Club.

With 40 members, the Physicians' Automobile Association of the Oranges has been organized by the medical men residing in that group of New Jersey towns embracing the Oranges. The officers chosen are: President, Dr. Edgar Calvin Seibert, of Orange; vice-president, Dr. Palmer A. Potter, of East Orange; secretary, Dr. Stephen G. Lee, of East Orange; treasurer, Dr. Arthur W. Bingham, of East Orange; governors, Dr. Thomas H. Harvey, of Orange; Dr. Mefford Runyon and Dr. Richard D. Freeman, of South Orange.

New Haven Automobilists Organize.

With Thomas G. Bennett as president, Jacob P. Goodhart vice-president, Amos F. Barnes secretary, and William H. Douglass treasurer, the New Haven Automobile Club has been formally organized. It is now a live association with a representative membership, a standard constitution and set of by-laws.

CEDRINO KILLED AT BALTIMORE

His Practice Spin on the Pimlico Oval Ends in Disaster—Collapsing Wheels Hurl
Him to His Death.

Emmanuel Cedrino, one of the best known Italian drivers in America, was instantly killed at the Pimlico track, Baltimore, last Friday, 29th ult.. while practising on the mile oval in preparation for the races that occurred the following day. The accident happened late in the afternoon, and Cedrino's car was the only one on the track at the time.

Cedrino wanted to try out the track before the races and it was late in the afternoon before he started on a practice spin.
Then he jumped into the car while his little brother, Matteo, got into the judges'
stand with a stop-watch, prepared to take
the time. He had covered three miles in
fast time and was just opposite the eighth
post on the fourth mile, when there was a
crash and the car lurched to the right, with
the right front wheel smashed to pieces.

With one hand tightly clutching the steering wheel, Cedrino reached for the clutch with the other, but he was too late. The impetus was tremendous and the powerful car leaped on its way, bumping once as the other front wheel collapsed. It was all over in an instant. With the front axle digging into the hard ground the car stood up on end and turned turtle. As it came over Cedrino was catapulted forward and he landed on his head. There was a shriek from the young brother Matteo as he and the few people at the track rushed toward the tragic spot. One glance at the mangled body of the Italian driver was sufficient. At Coroner Hollyday Emich's inquest a verdict of accidental death was given.

Cedrino has been a prominent figure in racing circles since 1904, and held several track records in this country. Before coming to America he was the head chauffeur for the Queen of Italy. His first noteworthy achievement in America was at Long Branch on August 22, 1905, when he set up a track record of 53:14% for 50 miles. He drove a car in the Vanderbilt cup race in the following October, but was put out of the running. At the last Florida beach meet he set up a record of 3:53:44 in the 300 miles race. He held all the track records for middleweight cars, from 1 to 15 miles, inclusive. He was generally regarded as a careful, though nervy driver. He had occasional mishaps, but never lost his nerve.

Emmanuel Cedrino was born near Turino, Italy, 29 years ago, and it is understood that his remains will be sent to the land of his birth for final interment. Cedrino was married about two years ago and leaves a widow and a young daughter.

DENVER RACE DEVELOPS HEROISM

Matthewson Wins in Long Grind on Rugged Roads—De Gaston Endures Torture in Struggle for Victory.

E. Linn Matthewson, driving a Thomas Forty, won the big 320 miles road race near Denver, Col., on Decoration Day, 30th ult. Matthewson covered this distance over a ten lap course of rough country in 8 hours 25 minutes 38 seconds, an average of 38 miles per hour. Albert DeGaston, in a Locomobile, finished second, but his time was not taken for the last lap. G. A. Clarke, in a Great Smith car, was awarded third place, as he was the third and only remaining one still running at the finish, from a field of eight starters. Matthewson has been protested by De Gaston, it being claimed that his winning car is not a stock model, which was one of the requirements of the race, and the protest will be referred to the American Automobile Association for decision.

It is doubtful if any sporting event ever held in Colorado ever attracted a greater concourse of people than did the automobile road race on Decoration Day. While it is impossible to exactly estimate the crowd of spectators that watched the race from different vantage points around the 32 miles circuit, expert figurers agree that there were more than 40,000 people on hand.

The start and finish was at the Model road house, some miles northeast of Denver, and the course extended over an ordinary and rough country road to Barr, crossing the railroad tracks twice in that stretch. From Barr it wriggled through the K. and P. ranch and over the low and excessively muddy region to the Brighton road, where it went through the town and across the Union Pacific tracks again. From Brighton the road extended through a sand bed, nearly hub deep, on to Henderson, Hazeltine and Adams, and then back to the starting point. Despite its tortuousness Loyern in a Thomas Sixty made the fastest lap of the course, covering the rough 32 miles in 45 minutes 2 seconds. Lovern, however, was unfortunate in wrecking his car in the sixth lap.

The race started promptly at 8 a. m., eight cars being sent away at intervals of

four minutes, as follows: 1, Brinker, Colburn; 2, Eubanks, Studebaker; 3, Clow, Colburn; Lovern, Thomas; 5, Matthewson, Thomas; 6, Clarke, Great Smith; 7, De Gaston, Locomobile; 8, Sanford, Thomas. Two of the original entries failed to start.

De Gaston, in the Locomobile, made the fastest run in the first lap, his time being 45:11, with Matthewson a close second in 45:30, and in point of time De Gaston led at the ending of the second lap. In the third lap, however, the exhaust pipe in some manner became loose and as the gases were escaping within the hood, De Gaston ripped the latter off. From that time until the finish of the ninth lap, plucky De Gaston had to breath the exhaust gases, and to further add to his discomfiture, the radiator became loose and permitted the hot water to splash over his face. There are very few men that would have stood this for seven hours-De Gaston was one of the few. He was in the race to win, and his pluck and nerve deserved a first, although he only got second. Alfred Longworth, his mechanic, also showed great pluck. At the finish of the long ordeal the skin on De Gaston's face hung in blisters, but the plucky young Frenchman was cheerful about it, forgetting his own injuries to praise his mechanic and to challenge Matthewson to another race.

Matthewson, the winner, drove a remarkable race and stopped only long enough to change tires. He started sixteen minutes behind the first car, but passed it in the first lap and from then until the finish kept the nose of his car in front. Matthewson is an experienced road and track driver and is expected to pilot one of the Thomas cars in the next Vanderbilt cup race. His mechanic was Harry A. Ball, only 19 years of age, but who rode like a veteran, and materially assisted Matthewson to win a great race. Several times when they struck the mud holes and water puddles Bell would take his coat and shield Matthewson's face to prevent the mud from flying in his face. Matthewson took a blind man's chance, but was lucky.

The Great Smith car was still in the running when the race was stopped and it was awarded third place. It had been having magneto trouble but was still gamely limping along. The others were all out, however. Brinker's Colburn was the first to dropout, as it developed leaky valves in the third lap, after covering the second in the

slow time of 1:21:39. In this lap also Sanford's Thomas cracked a cylinder and was withdrawn. There were no more accidents until the sixth lap when a mile north of Barr a tire on Lovern's Thomas gave way and the car ran amuck, overturning. Lovern and James Clock, his mechanic, were both thrown from the machine but escaped with slight injuries. The car was damaged too badly to proceed.

This left five cars in the race, but two others soon were put out of the running. Eubanks was pushing the Studebaker along at a mile a minute speed to make up lost time when an overheated journal brought him to a quick stop and a lap later the other Colburn car retired with a broken axle.

Road Race and Meet at Ogden.

Although it was not advertised beforehand it seems that somebody or other had an automobile road race and track meet at Ogden, Utah, on Decoration Day. A ten mile course from the Ogden river bridge to the Utah Hot Springs was the avenue in the morning and the road race was won by Harmon Perry, who covered the distance in 13 miutes 30 seconds. L. H. Beecraft was second in 14:00, and William Eccles failed to finish. Nine drivers stared in the ruabout class over the same course and the victory went to J. C. Jensen who finished in 15:45. Horace Peery was second in 16:30, William Ure third in 17:00, Archie Browning fourth in 17:30 and N. A. Gay brought up the rear in 18:30, the others failing to finish. A. E. Hyde, of Salt Lake City, made a ten miles trial over the same course and finished in 12:25. He drove a Pope-Toledo. At the meet at the Wasatch driving park in the afternoon L. H. Beecraft won both the five and ten miles events. The times are not given.

Readville Meet Postponed to June 17.

Rain caused a postponement of the Readville meet of the Bay State Automobile Association scheduled for Decoration Day. The track had been oiled in the morning and when the shower came up in the early afternoon the oil prevented the water from soaking in. Several of the contestants drove slowly around the track but declared it unsafe for speeding so the meet was postponed until June 17th, "Bunker Hill Day," when a crowd may be expected.

THROUGH 249 MILES OF MUD

Minneapolis Endurance Run Results in Only
One Perfect Score—Thirteen at the
Finish on Friday.

Over roads that were just a little bit better than no roads at all, 13 cars finished the two days' endurance run of the Minneapolis Automobile Club that ended on Friday night last, 29th ult. Of this unlucky number of cars in at the finish only one had a perfect score. The strenuous contest resulted in a notable victory for O. E. Martin, who drove a Thomas-Detroit through 249 miles of mud and mire with the least penalization. When the run finished the Thomas-Detroit was the only car that had a perfect score, but to make the test most conclusive of any that has yet been held, the technical committee got to work, while the gasolene expert figurers figured which car had been the most economical. Both this and the condition of the car counted in the final award, and the Thomas-Detroit came through with the highest percentage of .929, while two Ford cars, driven respectively by George Dorr and A. A. Hanson, were second and third in the final placing. So far as economy was concerned the two Great Arrow cars carried away the honors. The car driven by Paul Hoffmann had the highest percentage as regards economy, with 1,000, and his teammate, Winchester, was given a percentage of .986 in the economy award. For winning Martin receives the Tribune trophy and a gold watch.

The Minneapolis endurance run was as strenuous as any that has been held, although the distance was only 249 miles. The first day's run to St. Cloud, 151 miles, was easy for most of the drivers, as only three had bad luck. Thomas Bromwell, Oldsmobile, went into a ditch on the trip to St. Cloud and withdrew after he found that he was so late at the St. Cloud control as to prevent him making a good showing. On the return trip from St. Cloud to Minneapolis, F. H. Switzer's Moon car had considerable trouble and was withdrawn as it

was so late getting in. The most serious accident happened to H. J. Clarke's Pope-Hartford. On the return trip from St. Cloud an unexpected skid sent the car over a small bridge and it landed bottom up in the water. The car finally was righted and reached Minneapolis but with a penalization of 246 points. It later was disqualified for having left the official course. The total penalizations for the first day were as follows:

E. Simpson, Rambler, road work, 25 points; W. C. Rice, Kisselkar, road work 44, seals 175, total 219; D. Sutton, Welch, road work 2; T. Bromwell, Oldsmobile, time penalty 95, road work 107, seals 50, total 1,252; F. H. Day, Oldsmobile, road work 25, seals 25, total 50; W. A. Fox, Cartercar, road work 27; John Fawkes, Overland, road work 6, seals 50, total 56; H. J. Clarke, Pope-Hartford, time pealty 246. This left ten of the original starters with perfect scores, while one car had not reported.

The second day proved the Waterloo, however. The original intention had been to run to Mankato and return but the roads were reported to be in such fearful condition that a change was made, with Northfield as the turning point and the finish in Minneapolis—a total of 98 miles for the day's run. From the moment the cars left. Minneapolis the roads were nothing but seas of mud, and an interminable series of ruts reached all the way to Northfield. The cars were continually up to their axles in the sticky black loam which prevailed in the greater part of the roads. Despite this fact the trip to Northfield was uneventful and most of the cars reached there without any great penalization. The trouble came on the return trip.

With the pounding given the mud by the seventeen cars on their out trip and the warm wind blowing and getting in its drying work, the going was much better for a few miles out of Northfield. Then, just as every thing began to look lovely, a terrific thunder shower opened its batteries and within fifteeen minutes the course was a worse mire than it even had been in the morning. Ruts that had been worn down to a hard and firm bottom were again flooded and softened; bad sections that had

been carefully studied by the drivers were inundated and thus lost to view; rushing torrents coursed from every hillside and all the little valleys between inclines of the road were changed to lakes of mud and slime.

And then the grief began. Not heartbreaking, home-destroying grief, such as results when a man's car goes completely to the bad and refuses to give a last, dying kick, but plenty of the brand which bears all the earmarks, yet falls short of, the real article. Tire chains began to slip more frequently than before, while the low and intermediate gears were worked overtime in a heroic effort to pull the cars through the sloughs of despond. In one particularly had place in the road where all the rivulets and streams converged to turn the course into what looked like an impassable slough, the Cartercar became mired. Luckily the Mason came along and pluckily pulled it out at the imminent danger of becoming stuck itself. The Cartercar had a bad axle however and was left in a barn over night. A few minutes later the Welch sank in the same spot. And then the Pope-Hartford got it, too.

To make a long story short, there were only three cars that got back to Minneapolis with a penalization under 50 points. These were the Thomas-Detroit and the two Fords. Martin was the only driver that did not lose a point on either day, and the superb way he handled his Thomas-Detroit was the occasion for general comment and praise. His was a brilliant victory in spite of the adverse circumstances and he has reason to be proud of the handsome trophy and the gold watch which were his portion. Equally meritorious were the performances of Gus Hanson and George Dorr, who drove the two Fords, the smallest cars in the test. Hanson had tire trouble which caused him to lose two points, while Dorr lost but 25 points on the two days' run. According to the findings of the technical committee in their final examination the Franklin, driven by H. H. Mich, was in the best mechanical condition, and it was assessed only one point, but as it had lost 52 in road penalties on the second day that gave it a total which put it in fourth

Cooney, Thomas-Detroit, disqualified for leaving official course. H. J. Clarke, Pope-Hartford, disqualified for leaving official course.

TO FIGHT FIRES AT LONG BEACH

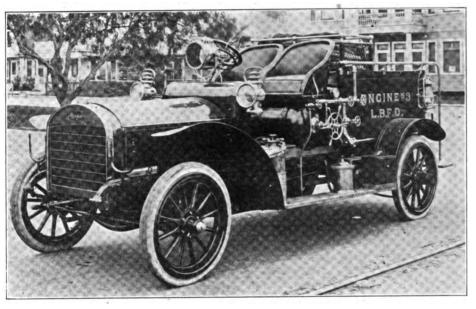

First Automobile Apparatus in Far West Carries Chemical Outfit and Full Complement of Men.

The first automobile fire fighter ever seen in the far West has lately been installed at Long Beach, Cal. The machine is a Rambler, designed by F. S. Craig, chairman of the Board of Public Works at Long Beach, and built by Thomas B. Jeffery & Co. at their Kenosha factory.

Many tests to determine the relative merits of horse-drawn and gasoline driven from specialists, and building to suit the individual tastes of prospective owners. His first production in this line is termed a combination vehicle, not from any specific property which it possesses, but because of its very catholic origin. It is propelled by a 17 horsepower motor of well known make, is of generally standard construction, and is mounted on 114-inch wheel base. Outwardly it bears a close resemblance to the typical American roadster runabout.

Pierce Luxuriousness in Book Form.

Of all de luxe productions of the printer's art as applied to automobile literature, none ever has been more impressively magnificent than "The Factory Behind the Great

FIRST AUTOMOBILE FIRE FIGHTER IN THE FAR WEST

fire apparatus were made before this car was selected.

The motor is of the four-cylinder vertical type, the wheel base is 120 inches, the regular 1908 Rambler tire equipment is used and the car is guaranteed to operate under a weight of 3,000 pounds at a speed of at least 35 miles an hour. Side chain drive is used, with three forward speeds and reverse. The chemical tanks are double 80-gallon receptacles and are placed under the forward seats. The rear portion of the car is used to carry 250 feet of hose. The coil of chemical hose is just back of the seats. Hand fire extinguishers are carried on the running board. Five men can be carried.

A special starting device has been provided in the form of an inclined platform so that when the alarm is received the platform is tipped and the car glides out of the station without one second's delay.

Combination Assemblage in Custom Car.

In the latest project of a Warwickshire maker the logical outcome of extended parts production is manifest. He proposes manufacturing cars to order and to specification, purchasing all the components

Arrow Car," which just has been issued by the George N. Pierce Co., Buffalo, N. Y. Primarily it is a description of the mammoth new plant, in which the Great Arrow is built. But it is much more than that. In describing the factory, the author, who is John Ford, also has described, by the aid of strong words, and glorious and well chosen pictures, the making of the car itself. The book is quarto in shape, and bound in boards with a quiet but impressive cover design in greens and gold. Heavy surfaced paper is used, and the 70-odd pages of contents are filled with vivid word sketches and illustrations, set off in neat gold decorations embodying the sign of the arrow. Every department of the plant is taken up in sufficient detail to show the nature and importance of its use. The pictures show not simply the place where the work is done, but also parts of cars almost beyond number in actual process of construction. It is a high grade work, thoroughly characteristic of the Pierce people and in keeping with their product.

"The A B C of Electricity." Price 50. The Motor World Co., 154 Nassau Street, New York City.

MOTOR VEHICLES IN MAIL SERVICE

France Adopts New Postal System Developed Through Recent Experiments—

Its Economical Features.

Experiments looking toward the permanent use of the motor vehicle in the handling of the mails which, as applied in Paris, resulted in the adoption of a number of gasolene machines, of which no less than 120 are expected to be in service shortly, as told in the Motor World recently, have also been carried out in other portions of France with equally successful results. A series of trials made at Lorris in the department of Loiret, not long since, were particularly successful, and have opened up possibilities in this conection which are entrely novel.

The system which has been worked out in this connection is one of distribution in the way of feeding rural or semi-rural routes which otherwise must have been poorly served because of the long distances the carriers were forced to travel in reaching the main distributing points. By localizing the work of the carriers in this way, and shortening up their routes, they were enabled to increase the number of deliveries per day, while the mails collected were invariably delivered at the center of distribution in sufficient time to meet the schedules over the trunk lines.

The test during which this plan was tried extended over a period of two weeks, from January 15th to 30th, last, and employed a closed touring car furnished by the De Dion Co. Of the conditions undertaken and the results secured, the Scientific American says:

The post office at Lorris has eleven postmen, who are obliged to deliver mail in the city and in the surrounding suburbs of Moutereau, Cour-Marigny, Chailly, Coudray, Chataenay, Noyers, Vielled-Maisons, and Grignon. Despite the fact that the postmen are supplied with bicycles, it is nevertheless difficult to give good service on account of the large amount of mail. As a consequence, most of the suburbs have only one delivery a day.

"The experiment was carried out in the following manner: Five of the postmen were located permanently in the suburbs of Moutereau, Cour-Marigny, Chailly, Coudray, and Chataenay. Each morning the automobile started at 7 o'clock and made the rounds of these suburbs, delivering to the various postmen their mail pouches. Upon receipt of the pouches, the postmen immediately began delivering the mail. The automobile also collected from the postmen the pouches filled at Lorris at 9.15 a. m., in time for the mail leaving at that hour for Montargis, a place some 13 miles distant, to which the mail is conveyed by a horse-drawn omnibus.

"The experiment proved that by using

an automobile in this manner, the services of several postmen could be dispensed with. and that two deliveries and collections per day could be readily made, the first delivery being a half hour earlier than before. This method of delivering mail makes it necessary for the postman to be on hand when the automobile arrives, and thus puts a check upon him. During the 15 days of the test, although the train was always late in arriving at Lorris, the automobile finished every trip on time."

America Importing Fewer Foreign Cars.

Foreign cars imported to the United States during the month of April last exhibited a falling off of some 33 per cent., both in number and value over the corresponding returns for last year. The 58 cars imported this year were valued at \$148,603 as compared with \$277,052, the value of the 89 cars brought over during April, 1907. France, though the largest contributor, with its 30 cars, in comparison to 70 imported last year, also was the greatest loser of American trade. Italy, on the contrary, doubled its exportation to America, sending just 20 cars. Germany gained by one car, sending 4 in all, while England's contribution consisted of 3 cars, as against 4 one year ago. The total valuation of components imported was \$38,365, in contradistinction to the \$66,957 aggregate of 1907.

B. & S. Apply the A. L. A. M. Standard.

The Billings & Spencer Co., Hartford, Conn., has been quick to turn to advantage the A. L. A. M. standard for rod and yoke ends. Their products conforming to the standard already are available. They are drop forged, of course, and are made strictly in accordance with the A. L. A. M. specifications both as to quality of material and design. Their design is such as will permit of the greatest possible radius of action, maximum strength with minimum weight. They are furnished either in blanks, milled or assembled. The shanks are swelled at the ends to facilitate hand welding. The adjustable yoke ends also are to be had in blanks or milled and threaded...

Temporary Cleaning of the Muffler.

Although it is necessary to remove the muffler from the car and take it entirely apart in order to clean it thoroughly, it is possible to effect a very satisfactory temporary clearing of its choked passages by tapping it lightly all over with a hammer. The result is that a considerable portion of the sooty accumulation within it is knocked off the walls and is blown out through the exhaust pipe.

The Hartford (Conn.) Automobile Dealers' Association are taking steps toward standardizing the price of supplies. Amongst other articles which are to be sold at a uniform rate is gasolene, for which it is proposed to fix a price of 20 cents a gallon for tourists.

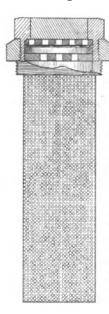

SAFETY DEVICE WINS GOLD MEDAL

Anti-Explosion Attachment for the Gasolene Tank-Sensational Experiments

in a Convincing Demonstration.

For being the "most meritorious invention for safeguarding motor vehicles," a gold medal last week was awarded by the American Museum of Safety Devices and Industrial Hygiene to the invention of William H. McNutt, for a device designed to prevent the explosion of gasolene and one which holds great interest for automo-

As shown in the illustration, the device, which is a combined cap and filler tube, consists of nothing more or less than a screen

made of perforated. brass, which is to be inserted in the filling hole of the tank. The cap varies according to the type of tank on which it is placed; if the tank is designed for gravity feed, a cap is used, the construction of which is very like an automatic intake valve, which permits the ingress of air and prevents an egress of vapor.

For pressure tanks

the valve principle is eliminated and the cap is solid. A feature of the caps, which is indispensible to the carrying out of the provisions for safety, is a fusible core, which as it is the weakest point in the tank, will blow out under an abnormal pressure; such a pressure as may be developed by the generation of gas due to the tank becoming over-heated. Each cap contains a perforated screen, and even when the gas from the tank is being emitted, a lighted match may be applied to the opening without causing either an explosion, or the ignition of the contents of the tank.

In a demonstration of the device made for a Motor World man, a metal covered table about five feet by four, was used. On the table were a half dozen cans of various sizes, each fitted with the perforated tube. The cans contained different quantities of gasolene, some were full, some half full, others had but little of the liquid, and one was empty, save for the few drops which may have remained from a previous demonstration. Gasolene was freely sprinkled over the table and a lighted match applied to it. The cans stood in the midst of the flames, uncorked. One cargenich contained perhaps a half pint of the fluid, was tipped over; the gasolene ignited as it flowed out of the filler hole of the can, but no explosion occurred.

A can that was half filled was picked up and a portion of its contents poured into another can; the stream of gasolene ignited as it went from the one receptacle to another, but the flame stopped at the spout of the can from which the gasolene was being poured, and at the filler hole of the other. The gasolene entered the latter, but the flame could not pass through the perforated tube

The demonstration was absolutely convincing. When once a can is equipped with the device there is nothing to fear from even the act of the servant: who attempts to facilitate the morning fire by pouring oil from the kerosene can. The filler tube and cap are made in various sizes, and readily can be applied to any receptacle designed to contain liquids. In the demonstration small "priming cans" equipped with the device were occasionally used.

While the invention only recently has been placed on the market, it was patented in July of last year. Its suitability to the purpose is evidenced not simply by the fact of the award of the medal, but by the fact, that it was recommended by the board of fire underwriters of New York after a series of exhaustive tests made more than a year ago. The whole value of the invention may be summed up by stating that neither heat or fire can cause an explosion of gasolene contained in a tank or receptacle fitted with this device, which is manufactured by the Non-Explosive Safety Naphtha Container Co., of New York.

Another of McNutt's inventions, which this company is making, is a device to be attached to or incorporated in the gasolene pipe between the tank and carburetter. In case of fire or intense heat attacking the motor, the flow of gasolene is automatically shut off by the breaking of a fuse wire which controls the action of a valve.

Tar Macadam to Make Roads Dustless.

Methods of allaying dust on the highway multiply to a bewildering extent, although the practical results of the thoroughly successful system remain to be evidenced to the casual user of the road. One of the most recent systems to be devised has lately been put to practical test in London before a committee of eminent engineers and governmental representatives, and is thought to be remarkably promising. It is a tar macadam process, in which the usual tar spraying is supplemented by the distribution of a surface layer of granite chips, which is subsequently rolled into the surface. A tar macadam road made in this way is said to cost from 85 to 97 cents a square yard as against 60 cents, the local cost per square yard of ordinary macadam. The surface so produced, however, is fine and smooth, and perfectly dustless.

OFFERS PRIZES FOR OUTLAWRY

A. C. A. Espouses Anti-American Cause and Outlines Its Spite Program-Grasping Georgians Execute a Flip-Flop.

Having started on a career of mischief making and having had its status as a purely local organization very formally and very explicitly and truthfully defined by the American Automobile Association, the aggrieved Automobile Club of America, of New York, felt called on to show its forcign correspondents, who had been "inspired" to protest against the rules for the Vanderbilt cup race, that it is possessed not only of not only the disposition, but of a few dollars, which it is willing to disburse in their interests.

The "call" was met at a special meeting of the board of governors of the club on Thursday last. Among those present were President Gary, head of the steel trust, whose interest in and familiarity with sport was so great that probably he knows less about the Vanderbilt and other rules than he knows about the price of asafoetida; Winthrop E. Scarritt, the Yankee Doodle oratorical fife and drum corps of the Orange mountains, who very properly left his Star Spangled Banner music at home, and "Bobbie" Morrell, the most convenient friend the press agents ever had, and who never stands on the shady side of any street when the sunlight of publicity is streaming. Morrell removed the bandages from his brow before entering the meeting. Dave Hennen Morris, who ought to know better than to mix with a sorehead movement, also was present. The club's chief garageman and secretary, who are carried on the club's payroll, likewise were in evidence in order to prove themselves worthy of their hire. Of course, the details of the meeting are not public property, but it was resolved to stand shoulder to shoulder with the foreign clubs which passed racing rules which bar the product of a number of American manufacturers, and to create as much of a disturbance as possible. It was decided that the surest means of attaining these ends was to defy the American Automobile Association and the National Association of Automobile Manufacturers which had agreed that three big national events each year were sufficient for all purposes. The A. A. A. having also ruled that any person engaging in an unsanctioned contest will be disqualified, the A. C. A. elected to promote four unsanctionable contests and thus raise a large crop of outlaws, and get as many people as possible into trouble. The club announced these decisions in the following resolutions:

Resolved, That the Automobile Club of America hold in the fall of 1908 a road race under the rules of the International Asso-ciation of Recognized Automobile Clubs,

as adopted at Ostend, July 14, 1907, and that the contest committee of the club be empowered to organize and carry out such a race.

Resolved, That the Automobile Club of America have a gold cup, to be known as "The Grand Prize of the Automobile Club of America," to be competed for annually in a road race to be conducted under the auspices of the Automobile Club of America under the rules adopted each year by the International Association of Recognized Automobile Clubs. The contest committee is hereby directed to have such a cup specially designed, of a character and value representative of the international importance of this event.

Resolver, That the Automobile Club of America organize and conduct each year the

following events:
First—The international road "The Grand Prize of the Automobile Club of America" under the rules of the International Association of Recognized Automobile Clubs as may be adopted each year.

Second-An international stock car race for the Briarcliff trophy.

Third-A long distance touring car con-

Fourth-A hill climbing contest.

Another meeting of the aforementioned people was held this week and all that emanated from the meeting rooms were exultant chuckles over the cablegrams that were read from the trade-controlled Automobile Club of France, besides the German club, and two other clubs which have never had cars in the Vanderbilt cup race, namely, the Royal Automobile Club of Great Britain and Ireland and the Automobile Club of Belgique. The Automobile Club de France, for which the Automobile Club of America acts as agent in this country. stated that it had held a meeting and had decided to recognize as official only the socalled grand prize race to be run by the New York club and to disqualify all French cars taking part in the Vanderbilt cup race, as well as to recognize the Automobile Club of America as its official representative. The English club congratulated the New York club on organizing a race and the German club indorsed the race besides stating that it would enjoin the German manufacturers to not participate in the Vanderbilt cup race. The Belgium club stated that it will maintain and respect the rules adopted at the conference at Ostend, in 1907. The Automobile Club of Afghanistan has not yet been heard from.

A cablegram from a Frenchman named Hogan, who apparently cannot read the English language correctly, also was received. It stated that the A. A. A. had made overtures to the French club. "overtures" were the resolutions adopted by the A. A. A. informing the foreign bodies that it was the ruling organization in America and that communications addressed to it would receive courteous consideration.

Later, advices from Savannah, Ga., state that the Savannah Automobile Club, which sought the Vanderbilt cup race and didn't get it, has executed a flip-flop and will join with the A. C. A. in promoting the "Grand prize race race" for outlaws.

FOR THE VANDERBILT CUP RACE

Date Fixed and Long Island Course Selected-Eliminating Trials will be Held, if Necessary.

The Vanderbilt cup race will occur on October 24th next, over a course on Long Island, which will include a portion of the motor parkway, work on which will be commenced on Saturday next, when 1,500 men will undertake its construction.

Announcement of these facts preceded by a day or two the issuance of the entry blank which gives other details.

Not more than ten cars will represent any one country and not more than three of any one manufacture. In the event of there being more than ten entries from a foreign country, the club representing such country will select the ten cars to compete. The club failing to make such selection before August 15th, 1908, the selection shall be made by the Vanderbilt cup commission

In event of there being more than ten entries from the United States, the racing board of the American Automobile Association will decide by a trial race of at least 250 miles to be held at least two weeks before the cup race, which of the entries shall compete in the cup race. This trial race will be limited to the first 30 cars entered to represent the United States, and the first 10 cars to finish shall be selected.

The distance of the cup race itself will be not less than 250 miles and not more than 300. Entries will close September 1st. Until that date the entry fee will be \$1,000; thereafter, it will be doubled.

Despite the peanut politics being played by the Automobile Club of America, socalled, in an effort to injure the race and the A. A., Chairman Jefferson De Mont Thompson has no fear of a dearth of foreign entries. He states that already he has been promised several foreign entries, while American manufacturers are building cars for the race, one entry of a six-cylinder car having been made this week. If the rules adopted at the Ostend conference and espoused by the A. C. A. were to govern the Vanderbilt race, six-cylinder cars would have been barred, even though they met the cylinder capacity requirement.

Another thing that happened this week which shows how small a foundation the Automobile Club of America stands upon to conduct a race of any sort is the authorized statement of Thomas Henderson, president of the National Association of Automobile Manufacturers, representing all the manufacturers in America. It is to the effect that the American manufacturers will stand by the American Automobile Association, which they recognize as the governing body, and will sustain and abide by its rulings.

RHODE ISLAND GRADES THE FEES

New Automobile Law in Effect on First of June-Its Enforcement in Hands of Board of Public Roads.

After many vicissitudes in the Rhode Island Assembly the several automobile measures that body has had under consideration during the present session have been crystalized in a new law which was passed by both branches on the 26th ult., and soon after was signed by the Governor. The law went into effect on Monday, 1st inst.

The groundwork of the new law will readily be recognized as being based on the Connecticut statute. of its noteworthy provisions transfers from the Secretary of State to the Board of Public Roads all the business of registration of motor vehicles and licensing of operators. It establishes a graduated scale of fees for automobile licenses, based on horsepower rating, and ranging from \$5 up to \$25, with a special fee for dealers fixed at \$50. Automobile trucks are not included in this scale, the fee required for their registration being only 50 cents. Motorcycles will be registered for the same fee. Operator's license fees are fixed at 50 cents for motorcycles and \$1 for other motor vehi-Visiting motorists are allowed 20 days in which to register. Speed is limited to 15 miles per hour in compact sections and 25 miles elsewhere. No racing on public roads is permissible under the law. Tire chains may be used on slippery roads. Cities and towns are prohibited from enacting or enforcing ordinances setting speed limits, or otherwise regulating motor vehicles except that they may exclude them from certain roads in their respective municipalities, other than State roads or main highways. Such closed roads must be designated by signs.

Exceeding the speed limit, operating a vehicle when intoxicated, or racing on the road on a bet or wager, or to make a record may be punished by a fine of not more than \$200, or imprisonment for not more than 30 days, or both, for a first offense; for a second offense the penalty is a fine of not more than \$500, or imprisonment for not more than 60 days, or both; for a third offense, within any one calendar year, the penalty is imprisonment for not more than 90 days, and disqualification for a term of two years. For making false statements on applying for registration, or for operating without a license the penalty is a fine of not more than \$500, or imprisonment for not more than 60 days, or both. Violation of any of the other provisions of the law entails a penalty of a fine not exceeding \$100, or imprisonment for not more than 30 days. or both. The full text of the new law follows:

Section 1. Definitions. The words and

phrases used in this act shall, for the purposes of this act, unless the same be contrary to or inconsistent with the context, be construed as follows: (1) "Motor vehicle" shall include all vehicles propelled by mechanical power, except road rollers, street sprinklers, fire engines and apparatus, police patrol wagons, ambulances, and such vehicles as run only upon rails or tracks;
(2) "motorcycle" shall include only those motor vehicles having pedals and saddle, with driver sitting astride; (3) "registration" has reference to vehicle; registration of a motor vehicle by the owner or person in control thereof does not give such person the right to operate the machine upon the public highways; (4) "license" has reference to the operator; each person who operates a motor vehicle must have an operator's license; (5) "public highways" shall include any highway, State road, public street, avenue. alley, park, parkway, drive-way or public place in any city, village or town; (6) "closely built up" shall mean (a) the territory of a city, village or town contiguous to a public highway which is at that point built up with structures devoted to business, (b) the territory of a city, village or town contiguous to a public highway not devoted to business, where for not less than one-quarter of a mile the dwelling houses on such highway average less than 100 feet apart, and also (c) the territory outside of a city or village contiguous to a public highway within a distance of one-half mile from any post office; provided. that for a distance of at least one-quarter of a mile within such limits the dwelling houses on such highway average less than 100 feet apart; and provided, further, that the city and town officers having charge of such highway shall have placed conspicuously thereon signs of sufficient size to be easily readable by a person using the highway, bearing the words, "slow down to 15 miles," and also an arrow pointing in the direction where the speed is to be reduced.

Sec. 2. Every owner of one or more motor vehicles shall file in the office of the State Board of Public Roads, on a blank furnished by said Board, a statement, under oath, of his name, residence and post office address, and a brief description of each motor vehicle owned or controlled by him, including the name of the maker, the number, if any, affixed by the maker, the character of the motor power and the amount of such motor power stated in figures of horsepower as advertised by the maker thereof, and such other information as shall be required by said Board. The said Board shall then register each such motor vehicle, assigning to it a distinguishing number or mark, and shall thereupon issue to the owner thereof a certificate of registration which shall contain the name, place of residence and post office address of the owner and the number or mark assigned to such motor vehicle, and such certificate shall at all times be carried upon such motor vehicle and shall be subject to examination upon demand by any proper officer. cates provided for in this section and in section 3 shall continue in force until one year from the date of issue, and upon the renewal of any such certificate said Board shall reassign the distinguishing number or mark contained therein.

Sec. 3. Every manufacturer of or dealer in motor vehicles may, instead of register-ing each motor vehicle owned or controlled by him, make application under oath to said Board for a general distinguishing number or mark, and said Board may, if as to the facts stated in said application. issue to the applicant a certificate of registration containing a name, place of residence and post office address of the applicant and the general distinguishing number

or mark assigned to him; and all motor vehicles owned or controlled by such manufacturer or dealer shall, until sold or let for hire, or loaned for a period of more than successive days, be regarded as registered under, and having assigned to them, such general distinguishing number or mark. Manufacturers or dealers shall not be required to carry such certificates upon the vehicles registered under the provisions of this section, but every person operating a motor vehicle registered under the provisions of this section shall display on such vehicle, in such manner as said Board may prescribe, the operator's license number assigned to such person.
Sec. 4. Every motor vehicle, except mo-

torcycles, shall, at all times while being used or operated upon the public highways of this State, have displayed in a conspicuous place and manner a plate or marker entirely unobscured and securely fastened upon both the front and the rear of such motor vehicle, the plate or marker on the rear thereof to be fastened so as not to swing. Said plates or markers shall be obswing. Said plates or markers shall be obtained from the State Board of Public Roads, as hereinafter provided, and shall bear the initial letters of this State and the number and mark assigned to such motor vehicle, the figures theron to be not less than four inches high and each stroke thereof to be not less than one-half inch wide; and in case of plates or markers not in use on motor vehicles on the date that this act takes effect, the letters and figures thereon to be not less than four inches high and each stroke thereof to be not less than onehalf inch wide.

Sec. 5. Every motorcycle shall, at all times, while being used or operated upon the public highways of this State, have dis-played thereon the initial letters of this State and number or mark assigned to such motorcycle, such letters and figures to be at least one inch high, and either painted on such motorcycle or displayed on a plate or marker securely fastened thereto, and motorcycle shall be operated with its muffler open.

Sec. 6. The State Board of Public Roads shall keep a record of all statements filed with said Board and of all certificates issued by said Board, which shall be open to public inspection; and said Board shall furnish, from time to time, at cost price, to any person having a motor vehicle registered under the provisions of this act. as many plates or markers as may be required by such person for display upon such motor vehicle. Upon the transfer of ownership of any motor vehicle its certificate of registration shall expire, and said Board, at its discretion, may reassign the distinguishing mark or number described in such certificate. In the event that any certificate or license issued by said Board under the provisions of this act shall be lost or destroyed, said Board shall issue to the person whose certificate or license has been so lost or destroyed, a duplicate thereof. In the event that said Board is unable to immediately furnish any plate or marker provided for by this act to any person entitled thereto. said Board may issue a certificate to such person stating that such marker has been ordered and giving the number thereof, and such person may thereafter use a temporary plate or marker, similar in form to the plate marker provided for by this act, until said plate or marker has been so furnished.

Sec. 7. No person shall operate a motor vehicle upon the public highways of this State until he shall have first obtained a license for that purpose, but nothing herein contained shall prevent the operating of a motor vehicle by an unlicensed person other than a person whose application has been refused or whose license has been sus-

pended or revoked, if accompanied by a licensed operator, which licensed operator shall also be personally liable for any violation of the provisions of section 11, 12 or 13 of this act. Licenses for operating mo-tor vehicles shall be issued by the State Board of Public Roads, but no license shall be issued to any person under the age of 16 years. Any applicant for a license to be issued to any person under the age of 16 years. Any applicant for a license to operate a motor vehicle upon the public highways shall be required by said Board to show such knowledge of the mechanism of motor vehicles, the rules of the road and the motor vehicle law, as will, in the opinion of said Board, render said applicant a proper and safe person to operate said vehicle upon the public highway. The State Board of Public Roads may, at its discre-tion, refuse to grant a license for operating a motor vehicle upon the public highways to any applicant whom, for any reason, it considers an improper person. Applications for licenses shall be made under oath upon blanks furnished by said Board, and said application blanks and said licenses shall be in such form and contain such provisions, not inconsistent with this act, as said Board may determine. A number shall be assigned to each license, and a proper record of all applications for licenses and of all licenses issued shall be kept by said Board at its office, and shall be open to public in-spection. Each license shall state the name, place of residence and post office address of the licensee, and the number assigned to him. Said license shall continue in force until one year from the date of issue, unless suspended or revoked for cause, and shall at all times be carried by the licensee when he is operating a motor vehicle upon the high-ways of this State, and shall be subject to examination upon demand by any proper officer; and said licenses shall have indorsed thereon in the proper handwriting of the licensee the name of said licensee and when requested by a proper officer, in the discharge of his duties under this act, said licensee shall write his name in the presence of said officer, to the end that the identity of said licensee may be determined

Sec. 8. The following fees shall be paid to the State Board of Public Roads for the certificates and licenses issued by it in accordance with the provisions of this act: Five (5) dollars for each certificate of registration of a motor vehicle, other than a motorcycle or automobile truck of 20 horsepower or less; ten (10) dollars for each motor vehicle over 20 horsepower and not more than 30 horsepower; fifteen (15) dollars for each motor vehicle of more than 40 horsepower; twenty-five (25) dollars for each motor vehicle of more than 40 horsepower; fifty (50) cents for each certificate of registration of a motorcycle or automobile truck or duplicate thereof; fifty (50) dollars for each dealer's or manufacturer's certificate; one dollar for each original license or duplicate thereof to operate a motor vehicle other than a motorcycle; fifty cents for each original license or duplicate thereof

of to operate a motorcycle.
Sec. 9. The State Board of Public Roads may after due hearing upon not less than three days notice in writing, suspend or revoke the license issued to any person under section 7 of this act, for any cause which it may deem sufficient; but every application shall be refused by said Board, and every licensee whose license shall be suspended or revoked by said Board, may appeal to the Superior Court from such decision, refusal or revocation, which court may affirm or overrule the decision of said Board. Every District Court in this State shall in every case in which a person is convicted of a violation of any of the provisions of section 11, 12, or 13 of this act

within 10 days after such conviction therein, transmit notice thereof to the State Board of Public Roads. Said courts may furnish to said Board the details of all flagrant cases which may be heard before them, and they may make such recommendations to said Board as to the suspension or revocation of the licenses of the parties defendant in such cases as they may deem proper. Said Board shall keep such data in its office, which shall be open to public inspection. Whenever any person licensed to operate a motor vehicle upon the public highways of the State shall have been convicted of any violation of section 11, 12 or 13 of this act, said Board may revoke the license of such person, and require the license of such person, and require the license of such person, and require a return of the same. No person shall, for the period of three months from the date of the revocation of his license, be capable of receiving a new license, nor thereafter except in the discretion of said Board.

Sec. 10. Any non-resident of this State who shall have complied with the laws of the State or territory of the United States in which he resides, requiring the registration of owners of motor vehicles, or of motorcycles, or of both, and the display of identification numbers on such vehicles, and who shall cause the identification numbers of such State or territory, in accordance with the laws thereof, and none other, together with the initial letter or letters of such State or territory, to be displayed on his motor vehicle while used or operated upon the public highways of this State, may bring his motor vehicle into this State for use on its highways without complying with the provisions of the foregoing sections of this act; provided, however, that if said non-resident shall use his motor vehicle on the highways of this State more than twenty (20) days in any one calendar year he shall then be subject to and shall comply with said provisions, and if he shall be convicted of violating, on any of said 20 days, any provisions of section 11, 12 or 13 of this act, he shall immediately be subject to and required to comply with all the provisions of this act relating to the registration of motor vehicles and the li-Sec. 11. No person shall operate or cause

sec. 11. No person shall operate or cause to be operated a motor vehicle on the public highways of this State recklessly or at a rate of speed greater than is reasonable and proper, having regard to the width, traffic and use of the highway, or so as to endanger property or the life or limb of any person, or in any event on any public highway, where the territory contiguous thereto is closely built up, at a rate of speed greater than 15 miles per hour. or elsewhere at a rate of speed greater than 30 miles per hour, subject, however, to all other provisions of this section, and of this act relative to the operation of such vehicles.

Sec. 12. Upon approaching any person standing or walking in the traveled portion of any public highway, or a horse or any other draft animal being led, ridden or driven therein, or a crossing of intersecting public highways, or a bridge, or a sharp turn, or a curve, or a steep descent, and also in passing such person or such horse or other draft animal, and in traversing such crossing, bridge, turn, curve or descent, the person operating a motor vehicle shall have the same under control and shall reduce its speed to a reasonable and proper rate. If such horse or other draft animal being so led, ridden or driven shall appear to be frightened, or if the person in charge thereof shall signal so to do, the person operating such motor vehicle shall bring the same and the motor or other power propelling the same immediately to a stop, and

if traveling in the opposite direction, shall remain stationary so long as may be reasonable to allow such horse or animal to pass, or if traveling in the same direction, shall use reasonable caution in thereafter passing such horse or other animal. Upon approaching a crossing or intersecting high-ways, a bridge, sharp turn, curve, or a steep descent, the person operating a motor vehicle shall slow down and give a timely signal with his bell, horn or other device for signaling. Whenever two vehicles meet on a public highway, the operator of each vehicle shall reasonably keep to the right so as to pass without interference. one vehicle overtakes another, the one in the rear shall give timely signal as aforesaid, and shall pass on the left, and the operator of the one in front shall seathe operator of the one in front shall seasonably bear to the right so as to allow free passage on the left. The driver of any motor vehicle on any highway, approaching an intersecting highway, shall slow down and keep to the right of the intersection of the centers of both highways, when turning to the right, and pass to the right of the intersection of the centers of said highways before turning to the left. Every driver of a motor vehicle, after knowingly causing an accident by collision or otherwise, or knowingly injuring any person, horse or vehicle, shall forthwith bring his motor vehicle to a full stop, return to the scene of the accident and give to any proper person, demanding the same, the number of his driver's license, the registration number of the motor vehicle, and the names and residences of each and every male occupant of said motor vehicle. Sec. 13. No person shall operate a motor

Sec. 13. No person shall operate a motor vehicle on the public highways of this State when intoxicated, or in a race, or on a bet or wager, or for the purpose of making a record.

ing a record.

Sec. 14. No city or town shall have power to make any ordinance, by-law or resolu-tion respecting the speed of motor vehicles, and no ordinance, by-law or resolution heretofore or hereafter made by any city or town in respect to motor vehicles shall have any force or effect: Provided, however, that city and town councils of the several cities and towns may exclude motor vehicles from certain roads in their respective towns, and shall designate such roads by public signs Provided, that such roads excluded shall not include State roads or main highways leading from town to town, and provided further, that powers given to any city or town to regulate shows, processions, assemblages or parades in streets and public places, and to regulate the use of public parks, and all ordinances, by-laws and regulations which may have been or which may be enacted in pursuance of said powers shall remain and be in full force and effect.

Sec. 15. No motor vehicle, while in use on the public highways of this State, shall have displayed upon either the front or the rear of such vehicle more than two registration plates or markers, nor shall any person display, or permit to be displayed upon his motor vehicle the registration number belonging to another vehicle or person, or a fictitious number, plate or marker.

Sec. 16. Every motor vehicle, while in use on the public highways of this State, shall be provided with adequate brakes, with a muffler and with a suitable bell, horn or other device for signaling, and shall, during the period from one hour after sunset to one hour before sunrise, display one or more white lights on the forward part of such vehicle, so placed as to be seen from the front, and shall also display, on the rear of such vehicle, a lamp so placed that it shall show a red light from the rear and a white light at the side, and so arranged as

to illuminate the rear number or marker, all of which said lights shall be of sufficient illuminating power as shall be prescribed by the State Board of Public Roads.

Every motor vehicle shall be provided with a lock, key or other device to prevent said vehicle from being set in motion, and no person shall allow any such vehicle operated by him to stand or remain unattended in any street, avenue, road, alley, highway, park, parkway or other public public place without first locking or making fast the vehicle as above provided. No motor vehicle tire shall be fitted with a chain when used upon gravel, macadam or other made roads, except upon natural dirt, asplialt, cobble, Belgium block or vitrified brick pavements: Provided, however, that tires may be fitted with a chain when reasonably necessary for safety in case of slippery roads.

Sec. 17. No person shall interfere or tamper with a motor vehicle without the per-

mission of the owner.

Sec. 18. Any person violating any provision of sections 11 or 13 of this act shall for the first offense be fined not more than \$200 or imprisoned not more than 30 days, or both; and shall for the second offense be fined not more than \$500 or imprisoned not more than 60 days, or both; and shall for the third offense within any one calendar year be imprisoned for not more than 90 days, and shall thereby forfeit his li-cense and be thereby disqualified from obtaining any such license within two years thereafter. Any person making false affida-vit under the provisions of sections 2, 3 and 7 of this act, or who shall register or cause to be registered any motor vehicle in the name of any person other than the owner thereof, shall be fined not more than \$500 or imprisoned not more than 60 days, or

by both such fine and imprisonment. Any person violating any other provision of this act shall be fined not more than \$100 or imprisoned not more than 30 days, or both, for every such violation, and any court before whom a final conviction shall be had,

under the provisions of sections 11, 12 or 13, of this act, shall indorse upon the license of the person convicted the date and particulars of such conviction.

Sec. 19. All money collected for registration, and license fees and fines under the provisions of this act shall be turned over to the general treasurer, to be used for the repair and maintenance of State roads and highways in this State under the roads and highways in this State, under the direction of the State Board of Public

Sec. 20. Sec. 20. Any person arrested for violating any of the provisions of this act may tender as bail a motor vehicle of which he is the owner, and if his interest in such vehicle is of sufficient value, it may be accepted as security for his appearance, in lieu of

Sec. 21. All certificates of registration of motor vehicles issued under the provisions of chapter 1157 of the Public Laws, passed at the January session, 1904, shall continue in force for 90 days after this act shall go into effect, but every owner of a motor vehicle so registered shall register such motor vehicle in accordance- with the pro visions of this act before the expiration of

said 90 days.
Sec. 22. The State Board of Public Roads may assign to any motor vehicle, registered under the provisions of this act, the same registration number and the same plates or markers heretofore assigned to it or used under the authority of chapter 1157 of the Public Laws, passed at the January

session, 1904.

Sec. 23. The Secretary of State is here-by authorized and directed to turn over to the State Board of Public Roads all records of the certificates of registration issued by him in accordance with the provisions of chapter 1157 of the public laws, passed at the January session, 1904, which shall be in his custody at the time this act takes effect.

Sec. 24. The State Board of Public Roads

may employ such asistance and incur such expense as may be necessary to carry out the provisions of this act, and the sum of two thousand dollars (\$2,000), or so much thereof as may be necessary, is hereby appropriated, out of any money in the treaspropriated, out of any money in the treasury not otherwise appropriated, to defray the expenses of such Board in carrying out the provisions of this act; and the State Auditor is hereby authorized to draw his order upon the General Treasurer for the payment of the said sum, upon the receipt by him of properly authenticated vouchers. Sec. 25. Chapter 1157 of the Public Laws.

passed at the January session, 1904, and all acts and parts of acts inconsistent herewith, are hereby repealed, and this act shall take effect from and after the first day of

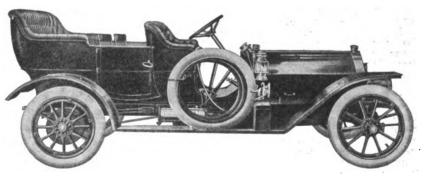

June, 1908.

Wildwood Club Holds Summer Election.

The Motor Club of Wildwood, which flourishes at the New Jersey coast resort of that name in the summer season, has elected to serve during the current summer the following officers: President, Philip P. Baker; vice-president, Evans G. Slaughter; treasurer, J. Thompson Baker; secretary, V. G. Reynolds; racing secretary, H. L. Hamersley; trustees, Thomas S. Goslin and John Bright.

HE PREMIER

The car which can be depended upon to do things and do them well

It is probable that no fully equipped touring car was ever called upon to attempt an undertaking as trying as the work of laying out the 1908 Glidden Tour.

The unusual difficulties were due to the condition of the roads, so thoroughly water soaked as to render them practically bottomless. The Premier met every requirement successfully and without delay to the party or car.

If considering the purchase of a car the performance of this regular stock Premier means something.

• Our Glidden Tour booklet and catalogue will be sent you upon request.

HORSEMEN IN HORSELESS VEHICLES

Types of Famed Equestrians, from Plain, Steppe and Sierra, as They Appeared Grouped in Automobiles.

When the circus comes to town even little old New York sits up and takes notice. And when Buffalo Bill's Wild West and Congress of Rough Riders of the World appears, the town sits up again and takes more notice, for while the Wild West really isn't the circus, it looks a good deal like it and causes much the same sort of thrills. When Buffalo William arrived here the last time the press agent got busy and the accompanying photograph is the result.

ceived the money which, he said, he turned over to his chief. The court, after hearing both stories, declared that Venable ought to have his money, but couldn't collect it from Blum, as the policeman had acted in an official capacity and properly had turned it over to his superior officer. The \$20 is supposed to be at the present time in the custody of the commissioner of motor vehicles.

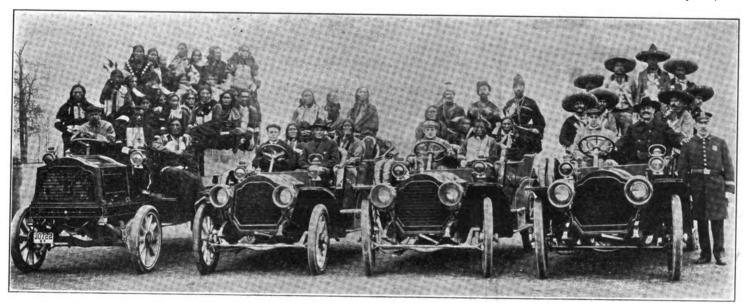

Owners Must Pay Two-Ply Tax.

When City Controller George T. Breunig, of Indianapolis, gets his plans for collecting automobile taxes fully into operation, many owners in that city will have a two-ply demand to met. Breunig purposes not only the enforcement of the ordinance requiring an annual license fee of \$3, but to compel owners to pay the 1907 fee which

COOLED CYLINDERS WITH COLD TEA

Odd Expedient of Lieut. Graetz During
Long African Journey—His Progress
Across the Dark Continent.

The attempt to reach Paris from New York, by automobile service, and by the indirect route via the American and Asiatic continents, have served to blot out of mind the efforts which a German army officer is putting forth to cross Africa by the same expeditious means. While the public has forgotten him, however, it appears that the ambitious Lieutenant Graetz has not been idle. When last heard from, he had fared to Fort Jameson in northeastern Rhodesia, some 100 miles west of Lake Nyassa, and a

REPRESENTATIVES OF HORSE LOVING RACES GROUPED IN HORSELESS VEHICLES

While there is nothing especially novel in the idea of photographing the peoples of different parts of the world in automobiles, this picture is of interest in that it depicts a group of three different peoples who are world famed as horsemen—Indians, Russian Cossacks and Mexicans.

Puzzling Disappearance of Cash Bail.

One of those queer experiences that sometimes come to motorists who fall into the clutches of the police was aired in the second District Court, Newark, on Friday, 22d ult. Frank P. Venable, of Paterson, told Judge Lintott that having been arrested in Bloomfield on a charge of exceeding the speed limit he was taken before Policeman John Blum, who was acting desk sergeant at the Bloomfield station. Putting up \$20 to assure his appearance in court the next day, he was permitted to go. When he made his appearance the next day the recorder was not on hand to try the case and since then, he said, he has received no notice to appear. For that reason he wanted his money back. Blum admitted having rethey refused to pay, pending the settlement of the question as to the validity of the ordinance.

Owners of automobiles insisted, until a recent decision by Judge Allen, of the Circuit Court, that the city's ordinance as it applies to automobiles was unconstitutional, as it was in conflict with the State law governing the licensing and control of motor vehicles. Judge Allen held, however, that it is not, as the city ordinance is a revenue measure, whereas the State law is purely a measure for police regulation. Automobile dealers, who brought the suit to test the ordinance, decided not to appeal the case from the Circuit Court, so the controller's office has ample authority for the severe measures which it is proposed to adopt to bring in the overdue fees for 1907 as well as those for 1908.

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

little north of its southern end. Up to that point he had covered about 1,500 miles, exclusive of detours required by exigencies of the country.

Starting from Dar-es-Salaam, the capital of German East Africa, he succeeded in making his way through Tabora to the southern end of Lake Tanganyka, whence he traced the road to Lake Nyassa, familiarized by Stevenson's "In Darkest Africa." The expedition has been 8 months on the trail, but was laid up in the Usagara Mountains, waiting for the arrival of a new cylinder from Europe, needed to replace one which had been cracked.

The book of his adventures is yet to be published, of course, but when issued, it is expected to contain a series of thrilling incidents, which the snow-ploughing exploit in North America can in no way equal. These will include a little of most everything from impromptu bridge building to running a motor with cold tea in the radiator across the Ugogo desert, where human thirst was wholly secondary to the demand of the parched cylinders for something cooling.

The Week's Patents.

883,146. Bearing for Supporting Radiators in Automobile Frames. Percy W. Noble, New York, N. Y., assignor to Charles A. Singer, Larchmont, N. Y., and Henry U. Palmer, Brooklyn, N. Y. Filed Nov. 23, 1907. Serial No. 403,493.

1. In combination, an automobile frame carrying a bearing box provided with a bearing seat, a radiator supporting saddle carrying a trunnion provided with a bearing surface, and a retaining bearing cone adapted to engage with said bearing box and the said surface of the trunnion.

883,167. Attachment for Motor Vehicles. Joseph H. Carpenter, Jr., and George J. F. Carpenter, Ossining, N. Y. Filed Jan. 9, 1904. Serial No. 188,297.

A device of the character described including a frame adjustably fastened to the rear frame of a vehicle comprising a sheet of canvas rigidly mounted on said frame, strengthening ribs intermediate of the side rods of said frame, said strengthening ribs being so shaped as to form a double deflecting line at the rear end of said vehicle.

883,179. Steering Gear for Motor Machines. Homer B. Ditwiler, Mansfield, O., assignor of one-fourth to Lewis W. Roe, Mansfield, O. Filed Nov. 7, 1907. Serial No. 401,075.

1. In a steering gear for motor machines, a steering shaft tormed with right and left screw threads, companion blocks having relatively opposite threads for engagement with the threads of said shaft, said blocks being formed with concave under faces and a yoke mounted for rocking movement and having its ends free and in constant contact with the corresponding concave under taces of said blocks.

883,202. Vehicle Brake. Edward A. Johnston, Sterling, Ill., assignor to International llarvester Company, a Corporation of New Jersey. Filed Aug. 16, 1907. Serial No. 388,761.

1. A brake mechanism for vehicles having, in combination, rotatable friction elements deriving motion from the road wheels, relatively fixed friction elements mounted upon a part of the vehicle, means for causing said fixed elements to engage with said rotatable elements, said means comprising separate rock-shafts, means for rocking said shafts in opposite directions, said means including separate lever arms secured to said shafts and extending in opposite directions from the axes thereof, a flexible connection between the outer ends of said arms, a brake controlling member adapted to be manipulated by the operator and having one end slidably engaging with said flexible connection intermediate the ends thereof.

883,207. Air Cooled Gas Engine. Cyrus B. Kurtz, Cleveland, Ohio, assignor of one-half to Frederick C. Bosworth, Cleveland, Ohio. Filed Aug. 27, 1906. Serial No. 332,127.

1. In an explosion motor, the combination with a crank shaft and connecting rod, of a cylinder open at both ends and comprising two portions having different diameters; and a hollow piston comprising two bearing portions fitted to the two portions of said cylinder, respectively, the portion of said piston having the smaller diameter being adapted in said piston's upper piston to project without said cylinder and said connecting rod being attached to such portion whereby the pin holding said connecting rod

may be removed without withdrawing the piston from the cylinder.

883,215. Seat Iron. George W. Luke, Jackson, Mich. Filed Sept. 12, 1907. Serial No. 392442.

1. The combination with a vehicle body of a seat iron secured to the inner side of the seat frame, and having an interiorly screw-threaded socket extending outwardly from the upper end thereof, a bracket support having a shank in screw threaded engagement with the socket, a check-nut on the shank bearing against the socket and a goose neck removably secured to the outer end of the bracket support being provided with a tapering aperture and the gooseneck with a corresponding foot seated in said aperture.

883,240. Internal Combustible Engine. Louis G. Sabathe, Paris, France. Filed Nov. 23, 1905. Serial No. 288,712.

1. In an internal combustion engine, the combination, with means for introducing a charge of inert gas, of means for subsequently and separately introducing a charge of combustible material and a charge of oxygen.

883,261. Wind Shield. James Webster, Chicago, Ill. Filed Feb. 6, 1907. Serial No. 356,073.

1. In a wind shield, in combination, a plurality of sections, hinges uniting adjacent sections and having a sliding engagement with one of the sections.

883,266. Starting Clutch. John F. Wilkinson, Gloucester, Mass. Filed April 19, 1907. Serial No. 369,093.

1. A clutch mechanism comprising a rotary member having an annular groove in a lateral face thereof, a stud having an eccentric head located in said groove, an arm supported so as to be movable bodily about the axis of said member by which said stud is carried non-rotatably, and driving means so engaged with the arm as to move the same both oscillatively and bodily to crowd the head of said stud between the walls of the groove and turn the said member.

883,274. Device for Carrying Spare Wheels or Tires on Motor Cars. Alfred J. Bailey, Salford, England. Filed May 28, 1907. Serial No. 376,180.

1. In combination with an automobile, a vertical standard mounted thereon, a frame extending laterally from the standard, means for swiveling the frame on the standard, and means for holding a tire to the frame.

883,340. Induction Valve for Internal Combustion Engines. Robert E. Phillips, Westminster, London, England. Filed April 22, 1904. Serial No. 204,448.

1. In induction valve mechanism for internal combustion or explosion engines of the four-cycle type, a valve casing carrying an induction valve and seat therefor and having a guide for the stem of the valve, a projection on the valve stem, a hollow plunger sliding in the casing and adapted to engage the said projection and through which the stem of the valve passes, a spring between the casing and the plunger acting to retain the valve in its closed position, and mechanical means for depressing the plunger to compress the spring and thus relieve the valve of its pressure.

Studebaker Electrics

For the Business Man

The Studebaker Electric Runabout or Stanhope is as convenient as the formerly so popular bicycle with all the comforts of the finest carriage. The fact that the car is a Studebaker is a sufficient guarantee of satisfactory performance

The Professional Man

Finds in a Studebaker Electric a vehicle of great utility and at the same time a conveyance that can be operated at very low cost.

For Women's Use

A Studebaker Victoria-Phaeton is the ideal conveyance. Its daintiness and luxury of appointment instantly appeal to her refined taste. So simple is the control that it is safer to drive than a horse, and two or three lessons are all that any woman needs to learn to drive.

GASOLINE MODELS ALSO

883,347. Compressor. Edmund W. Roberts, Clyde, Ohio. Filed Sept. 29, 1906. Serial No. 336,755.

1. A multi-stage compressor comprising in combination compression cylinders of different stages, and an intercooler comprising a hollow annulus connected to both said cylinders and surrounding one of them.

883,371. Vehicle Steering Device. George H. Young, Des Moines, Iowa. Filed May 21, 1907. Serial No. 374,929.

1. In a device of the class described, the combination of a vehicle frame, four axles pivotally supported therein, a spring bar pivotally connected with the frame, a collar mounted on the inner end of each axle, arms connecting the ends of the spring bar with the collars on the forward axles, and crossed arms for connecting the spring bar with the collars on the rear axles.

883,398. Flexible Tire for Vehicle Wheels. Clement C. Gouin, Paris, France. Filed Oct. 2, 1906. Serial No. 337,074.

1. A vehicle wheel tire consisting ecsentially of pieces of leather disposed edgewise and secured together, separate end plates secured to the respective ends of said tire and separated by a space, a securing plug filling said space, and a device mechanicall connecting said plug to said end plates and also adapted to secure the plug to the wheel rim.

883,454. Mud Shield for Vehicle Wheel Guards. George W. Dunham, Lansing, Mich., assignor to Olds Motor Works, Lansing, Mich., a Corporation of Michigan. Filed Dec. 1, 1906. Serial No. 345,918.

1. The combination with a wheel fender, of a sector shaped shield attached to one edge of said fender, a fender supporting arm, and an attachment between said shield and said supporting arm near the center of the sector.

883,461. Explosive Engine Starter. Carl C. Ilg, New York, N. Y., assignor, by direct and mesne assignments, of one-third to Nothan B. L. Cosel and one-third to Richard Frankenbush, New York, N. Y. Filed March 15, 1907. Serial No. 362,492.

1. In an explosive engine starter, the combination with an engine, of a shaft connected with the engine and by which the engine may be actuated, a wheel fitting said shaft movably, and said wheel having internal ratchet teeth, the said shaft having recesses extending lengthwise from one end the said wheel being placed on the shaft over the said recesses, pawls constructed to be inserted from the end of the shaft into said recesses after the wheel is in place and arranged to engage the ratchet teeth of the wheel, means for retaining the pawls against longitudinal displacement, and means for operating the wheel from a distance.

883,469. Roller Bearing. George A. Mc-Keel, Jackson, Mich., assignor to George A. McKeel & Company, Limited, Jackson, Mich., a partnership association. Filed Feb. 16, 1905. Serial No. 245,894.

1. In a roller bearing, two rings spaced apart and each provided on its inner face with a plurality of approximately semi-spherical spaced recesses opening through the periphery of the rim. each of said rings having a channel in the periphery surrounding each opening to form a marginal flange at the upper end of the opening, rollers having ball ends bearing in said recesses, the said flanges on the periphery of the rings surrounding said recesses overlapping the ball ends of the rollers and forming the

upper wall of the ball seat and also holding the rollers in position in the rings.

883,511. Gas Engine. George A. Beaudet, San Francisco, Cal. Filed July 19, 1907. Serial No. 384,581.

1. In a gas engine, the combination of a cylinder having an exploding chamber communicating with the cylinder space through a valve controlled opening, means operating to open the exploding chamber to the cylinder space when the cylinder is taking in gas and to shut off communication of said chamber with the cylinder space after the explosion of the charge, a valve controlled exhaust outlet leading from the exploding chamber, means operating to open the said chamber to the exhaust when said chamber is closed to the cylinder space, and to close it to the exhaust when the cylinder space is in communication with the said chamber, and a supplemental exhaust outlet leading from the lower part of the cylinder space and arranged to open said space to the exhaust when the piston is at the end of its stroke after an explosion.

883,557. Latch for Change Speed Gears for Automobiles. Emile L. P. Mors, Paris, France, assignor to The Societe Anonyme d'Electricite et d'Automobiles Mors, Paris, France. Filed Aug. 21, 1906. Serial No. 331,474.

1. The combination in shifting mechanism of an operating spindle, and a plurality of shifting rods parallel thereto and actuated thereby, and means for locking the remainder during the movement of one of the rods by said operating spindle.

Muts That Require Tightening After considerable use the bolts holding the sprocket rings to the driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

HARTFORD, CONN.

Large Sales

make it possible for us to import THE CELEBRATED BRAMPTON CHAINS from ENGLAND (paying freight and duty), and sell them at the same price at which the several other automobile chains are sold to manufacturers, jobbers, dealers and users.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides on the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement.

THE BRAMPTON CHAIN is made of helf-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material—self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMP-TON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size—as follows:

CHAINS TO FIT AMERICAN CARS

We also carry in stock the BRAMPTON CHAINS to fit Foreign Cars-Mercedes, Panhard, Martini, Fiat, etc.

Your 1908 Car

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

Agents wanted in unoccupied territory. Catalog on request.

We are Sole American Agents for BRAMPTON CHAINS, and they cannot be bought from anyone else except through our Agents.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches; leaves the automobile with its original new lustre, without being sticky or greasy. Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all Automobile Dealers. Price 60 cents per bottle.

The Miller Automobile Jack

The Miller Automobile Jack is a quick acting, automatic lowering jack, designed especially for automobile use, and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. It is high-grade and one of the finest finished jacks on the market. We guarantee this jack for twelve months. The list price of the Miller Jack, \$3.50 each.

INCOMPARABLE WHITE

THE CAR FOR SERVICE

New San Francisco-Los Angeles Record.

A 30 horsepower White Steamer, carrying four passengers, set up a new record from San Francisco to Los Angeles on April 28th, 1908, covering the 478-mile mountainous journey in 17 hours and 17 minutes, thus cutting 56 minutes from the former record which had stood for nearly two years. Furthermore, the record-breaking White was at once driven back over the road to San Francisco in 19 hours and 43 minutes, thus establishing a round trip record of 37 hours.

Price, \$2,250, Other Models from \$1,000 to \$2,350

HOW OUR FACTORY SAVES YOU MONEY

A PERFECT factory organization and quantity production, with a consequent saving in cost of materials and making, has enabled us to build this speedy and classy roadster with the power and endurance of a touring car and the convenience of a runabout—to sell at \$2,250.

We want you to compare this Rambler with any car on the market, even those selling at twice the price. You will see why you do not have to pay any more to get the best.

In making this comparison, notice those big 36-inch wheels and the long wheel base. These insure riding comfort. Then notice the enormous braking surface, which makes you the master in control; the accessibility of the engine, which saves trouble; the roller bearing transmission which saves wear; the offset crank shaft which utilizes the maximum power of the engine and the straight line drive which delivers that power with least possible frictional loss to the rear axle. All these features make the Rambler.

THE CAR OF STEADY SERVICE Your friend is driving a Rambler. Why not you?

Will you write today for booklets describing all models and all features?

No. 11

DATES FIXED FOR GARDEN SHOW

To Be Held in January—Old Committee in Charge—Architects and Decorators

Already at Work.

As was expected, the week January 16-23 has been selected as the dates for the Licensed Association's 1909 show in Madison Square Garden, New York. The "independent" show in Grand Central Palace will have closed on the 7th of that month.

The choice of dates was made at a meeting of the A. L. A. M. in New York on Thursday last, at which these members were present:

J. S. Clarke, Marcus I. Brock, Autocar Co.; W. C. Leland, Cadillac Motor Car Co.; M. S. Hart, Corbin Motor Vehicle Corp.; J. H. Becker, Elmore Mfg. Co.; H. H. Franklin, G. H. Stillwell, A. T. Brown, A. E. Parsons, H. H. Franklin Mfg. Co.; E. Hewitt, Hewitt Motor Co.; A. N. Mayo, Knox Automobile Co.; S. T. Davis, Jr., Locomobile Co. of America; H. Lozier, Lozier Motor Co.; William E. Metzger, Northern Motor Car Co.; F. L. Smith, Olds Motor Works; H. B. Joy, Packard Motor Car Co.; C. Clifton, George N. Pierce Co.; A. L. Pope, Pope Motor Car Co.; George Pope, Pope Mfg. Co.; E. D. Shurmer, Royal Motor Car Co.; G. E. Mitchell, Alden Sampson, 2d; R. H. Salmons, Selden Motor Vehicle Co.; E. McEwen, F. B. Stearns Co.; C. C. Hildebrand, Stevens-Duryea Co.; E. S. Church, Waltham Mfg. Co.; Thos. Henderson, Winton Motor Carriage Co.

The old show committee was re-elected, viz.: Col. George Pope, chairman; Marcus I. Brock and M. L. Downs, secretary. Architects and decorators already are at work on the decorative scheme, which it is probable will be ready early next month.

Spare Wheel of America Reorganizes.

Largely as a result of a visit of two of the English directors of the concern, the sales department of the Spare Wheel Motor

Co. of America, Ltd., in Chicago, has been completely reorganized and additional facilities have ben installed in the factory at St. Anne. Ill. All of the men who represent the company in Chicago were released and the management of the sales department turned over to George S. Morrow, who previously had had to do with the Spare Wheel in trests in New York. The company, which controls the Stepney wheel in America, likewise has removed its headquarters from the third floor of a Chicago office building and is now located in a commodious street floor salesroom at 236 Michigan avenue, where the public better can be interested and its spare wheel practically demonstrated. The injunction suit which had been brought against an alleged violator of the Stepney patent is being pressed for a quick decision.

Prest-Q-Lite has Another Explosion.

For the third time within less than a year the Prest-O-Lite company's plant in Indianapolis, Ind., was badly damaged by an explosion on Saturday, 6th inst. The previous ones were at the old plant in South East street, the latest occurring at a new plant at 211 East South street. It was in reality a series of explosions, the first, for which no cause has been determined as yet, being followed by others resulting from the fire caused by the first. St. Vincent's Infirmary, located nearby, was somewhat damaged, and a city fire house was wrecked. The total loss is estimated at \$10,000. The company has under construction still another plant in a more sparsely built up section, to which it purposed removing all the business of charging when completed.

New Reliance Company Succeeds Old One.

The Reliance Motor Truck Co., just incorporated in Michigan with a capital of \$250,000, has taken over the business of the Detroit company of the same name. It will locate in Owosso. The officers of the company are: President, Fred O. Paige. Detroit; vice-president, A. M. Bentley, Owosso; secretary-treasurer, W. F. Benkelman, Owosso.

ROYALTY REDUCED 20 PER CENT

Courts Authorize Revised Agreement with Selden Licensees—Limitation Placed Upon Yearly Maximum.

Despite the opposition brought to bear by those who dearly would love to bring about the embarrassment of anyone or anything interested in the Selden patent, the United States Circuit Court for the New Jersey District, last week granted the application of the receivers of the Electric Vehicle Co. for permission to reduce the amount of royalty heretofore exacted of the holders of Selden licenses. Following the decision of the Federal Court, the Superior Court of Connecticut promptly extended its approval of the plan.

The facts that all the licensees are included in the Association of Licensed Automobile Manufacturers and that all save two of them had refused to make overdue payments, alleging that the amount of royalty imposed was "excessive and oppressive," induced several imaginations to discern in the situation the early disruption of the A. L. A. M. Of this, however, there was not at any time any likelihood.

Under the existing agreement, the licensees are obligated to pay 1½ per cent. of the catalog price of all vehicles they produce, except such as may be exported, on which the royalty is ½ per cent. Payments are required to be made quarterly, a discount of 20 per cent. being allowed for payments within 15 days, thus making the net royalty 1 per cent.

The revised agreement, which just has been authorized by the courts, will reduce the royalties of the licensees by 20 per cent., with the further limitation that the maximum royalties to be paid in any one year shall not exceed \$250,000. It also will provide that should a decree be entered adjudging the Selden patent invalid, the royalties shall, pending an appeal from that decision, be paid to the trustee to await the

outcome of the appeal. In addition, certain modifications of the terms upon which new members to the Association may be admitted, and surrenders to the Association control of litigation to compel payments of royalties in excess of the maximum annual amount of \$250,000 above referred to. The "terms for new members" are understood to be a matter of phraseology.

In substance, the new agreement means that henceforth the total revenue in royalties from the Selden patent will not exceed the sum of \$250,000 annually. The 20 per cent. reduction in the royalty will bring the proportion from 11/4 to 1 per cent., which, less the 20 per cent. offered for cash 15 days, will make the net royalty 8-10 of 1 per cent. There will be no change in the basis of division between the Electric Vehicle Co. and the A. L. A. M. As at present, the former will retain three-fifths and pay to the association the remaining twofifths. On this basis, if the maximum amount, \$250,000, is reached, the Electric Vehicle interests will receive \$150,000 and the A. L. A. M. \$100,000.

Dealers' Complaints to be Investigated.

After a meeing of the directors of the National Association of Automobile Dealers, held in Chicago last week, it was officially given out that there were taken up "complaints from members in various parts of the country about the methods employed by some of the jobbers and certain tire makers and automobile manufacturers in disposing of their product. The secretary was instructed to inquire into the circumstances surrounding the matters complained of and to communicate with the various firms and try to adjust these matters to the satisfaction of the complaining members, and if possible in a manner that will prove of lasting benfit to both sides."

Cabs and Motorcycles at Palace Show.

Taximeter cabs and motorcycles both will be featured by the American Motor Car Manufacturers Association at its show in Grand Central Palace, New York, December 31-January 7. Special sections will be set apart for the display of each type of vehicle. It is probable that the same idea will be carried out at the Association's show in Chicago, to select the building and complete the arrangements for which General Manager Reeves now is in that city.

Kitto-Pugh Litigation Reaches Last Suit.

W. H. Kitto, who was secretary of the defunct Motor Components Mfg. Co., of Des Moines, Iowa, has made a settlement with A. D. Pugh, who sued him for \$1,000 for attorney's fees. By a payment of \$500 he secured dismissal of the suit. There yet remains of the batch of suits and countersuits between the two men Kitto's suit against Pugh for \$10,000 damages, based on Pugh's alleged "queering" of Kitto in other transactions.

The Week's Incorporations.

Chicago, Ill.—Swinehart Clincher Tire & Rubber Co., under Illinois laws, with \$200,000 capital; Ohio corporation dealing in rubber tires.

Rockport, Mass.—Lands End Motor Co., under Massachusetts laws, with \$10,000 capital. Corporators—C. Burton Martin, Arthur Fairweather, Anne McCarthy.

Greenfield, Mass.—Reliance Motor Bus Co., under Massachusetts laws, with \$10,000 capital. Corporators—George H. Wright, Charles G. Bascom, Winnie L. Bascom.

Boston, Mass.—Supplementary Spiral Spring Co., under Massachusetts laws with \$10,000 capital. Corporators—Henry D. Crowley, Mary E. Lucey, Anne E. McGrail.

Indianapolis, Ind.—Commercial Motor Vehicle Co., under Indiana laws, with \$10,000 capital. Corporators—Carl Moller, William H. Thomas, Otto M. Moller, L. H. Adams.

East Orange. N. J.—Atlantic Motor Car Co., of New Jersey, under New Jersey laws, with \$12,000 capital; to deal in automobiles. Corporators—C. O. Geyer, F. C. Ferguson, F. E. Ruggles.

New York, N. Y.—Fox Metallic Tire Belt Co., under New York laws, with \$100,000 capital; to manufacture automobiles, etc. Corporators—W. A. Malone, A. E. Smith, W. H. Klock, New York City, N. Y.

New York City, N. Y.—Empire Taxi-Motor Cab Co., under New York laws, with \$10,000 capital. Corporators—James S. McLean, Arthur A. Ernst, Edward R. Wells, 437 Fifth avenue, New York City, N. Y.

Buffalo, N. Y.—Pioneer Spring Hub Co., under New York laws, with \$100,000 capital; to manufacture spring hubs for automobiles, etc. Corporators—W. A. Hyde, Syracuse, N. Y.; G. H. Ismon, G. L. Lerch, Buffalo, N. Y.

New York City, N. Y.—Vulcan Storage Battery Co., under New York laws, with \$25,000 capital. Corporators—Franz Sigel, Charles E. Lansing, 38 Park Row, New York City, N. Y.; William Knobloch, Williamsbridge, N. Y.

New York City, N. Y.—Northern Chemical Co., under New York laws, with \$25,000 capital; to manufacture dust allayer known as "florozone." Corporators—E. J. Magen, H. Roth, New York City, N. Y.; L. E. Stubenvoll, Jersey City, N. J.

New York City, N. Y.—Cedarhurst Motor Livery Co., under New York laws, with \$10,000 capital. Corporators—Peter T. Radiker, Nellie F. P. Radiker, 159 West Eightyseventh street; Mary C. Pease, 269 West Eighty-fourth street, New York City, N. Y.

In the Retail World.

D. D. Baskerville is to open a new garage in Madison Wis., and will handle the Mitchell cars.

The Moon Sales Co., which will handle the Moon car in New York, has located at 2182 Broadway. S. L. Patton and W. H. Miller, of Oklahoma City have opened a garage at Ranch Creek in that State.

The Bond Motor Car Co., Bradford, Pa., are making ready to erect a new garage; the plans therefor already are in the contractor's hands.

The Orange Garage Co., Orange, N. J., are building a new garage. It is claimed that when completed it will be one of the finest in the State.

The Wheeling (W. Va.) Automobile Co. has been discharged from bankruptcy. The concern got into difficulties several months ago, but has succeeded in weathering the storm.

Work has started on the new garage for the Orange Auto Co., in Main street, East Orange, N. J. The building will be of brick one story high, with a frontage of 40 feet and a depth of 175 feet.

Creditors of H. W. Berthiaume, a San Francisco dealer, have filed a petition to have him adjudged bankrupt. The petitioners are the Boyer Motor Car Co., H. W. Bogen, Inc., Cuyler & Co., and the Weinstock-Nichols Co. Their claims aggregate \$1.061.

The Columbia Garage, Spokane, Wash., will remove to the old National Iron Works property in that city. Plans are under consideration for the erection of a brick annex, 60x80 feet, to be used as a garage, the old building to be used as a machine and repair shop.

The partnership of Williams & Crafvy, which has been operating in Worcester, Mass., as the Worcester Motor Car Co.. has dissolved, Williams having purchased the interests of Crafvy. Williams will continue the business under the old name and will handle the Franklin line of cars exclusively.

Phelps Brown, who hitherto has been in the newspaper business, has purchased an interest in the Indianapolis Motor Car Co., of Indianapolis, Ind. He will become the company's "financial agent." His associates in the company are Alfred Markham, who holds the office of president, and Paul Smith, who is secretary-treasurer.

The Pendleton Automobile Co. Franklin, agents at Pendleton, Ore., are building a fine new garage, 90 by 100 feet. This is to be equipped with first-class machinery and will be one of the finest garages in the northwest. It is asserted that the State of Washington contains more Franklins than any two other makes, 186 being in use there.

Charles A. Haskin has taken over the interests of his two partners in the W. A. Frederics Co., Boston, Mass., and the business has been incorporated under Massachusetts laws as the American Automobile Co., capitalized at \$60,000. Haskin is president and general manager, with Edwin C. Hayden as vice-president, B. R. Dorman, treasurer, and W. A. Webber, secretary.

POPE RECEIVERS RENDER REPORT

Some Interesting Figures Brought Out in Petition for Further Authority—Huge Claim Against Pope-Toledo.

The report of the receivers of the Pope Mfg. Co., which accompanied their petition to the Chancery Court of New Jersey for permission to continue the business, proves to be an interesting document.

It discloses, among other things, that in addition to the claim for \$787,987.84 filed against the Pope Motor Car Co., Toledo, Ohio, there is standing against the latter concern on the Pope Mfg. Co.'s books a debit of \$1,000,000. The smaller amount, for which a claim has been legally filed, is for "moneys paid out for and advanced to the Pope Motor Car Co."; the round million is for a dividend declared by the latter company and later rescinded by its board of directors. No claim has been filed for the million dollars, but the time within which such a claim may be lodged with the courts does not expire until Monday next, 15th inst. There is no intimation, however, that such action will be taken.

The receivers report that they have made and disposed of 500 Pope-Hartford cars, and the operations at the Hartford factory since the appointment of receivers up to May 1st, 1908, have resulted in a net profit of approximately \$215,890.20, and the profits for the year ending July 31st, 1908, have been estimated at the sum of \$405,022.80.

Up to May 1st the Pope company's Westfield (Mass.) bicycle factory has earned a net profit of approximately \$35,797.49, which it is believed will be increased to \$69,399.47 by July 31st next. The Hagerstown (Md.) plant, which is used chiefly for building the Pope jobbing bicycles, had been carried on at a net profit of \$17,546.85 up to May 1st.

On May 19th last, there was in the possession of the receivers apointed by the New Jersey court or by the ancillary courts in the various respective districts the following sums:

New Jersey	\$ 405,041.70
Connecticut	338,061.22
Massachusetts (not including In-	•
ternat'l Trust Co. \$9,407.49)	54.530.12
Maryland	89,481.68
New York	
Illinois	24,312.36
The receivers in all jurisdiction	ons had on

 May 19, 1908, outstanding and uncollected:

 Connecticut
 \$138,293.29

 Massachusetts
 119,484.42

 Maryland
 67,862.59

 Illinois
 7,416.91

 New Jersey
 24,607.27

\$357,664.48

In applying for permission to continue the business and to make plans and purchases for next season, the receivers reccommend that they be authorized to manafacture 700 Pope-Hartford 1909 models and 50,000 bicycles. As stated in the Motor World last week, the hearing on their petition will be held June 17th,

Rogers Arranging the Mitchell "Jubilee."

G. Vernor Rogers, secretary of the Mitchell Motor Car Co., left for the Pacific Coast this week to complete the arrangements for the second annual jubilee of Mitchell owners, which will take place in and about San Jose, Cal., July 3d and 4th. It is expected to prove the largest gathering of owners of a particular brand of cars that ever has occurred.

The affair will open on July 3d, with the annual hill climb, the prizes for which will range from silver cups to luncheon outfits and clocks. Timing will be by telephone and the first car will be sent away at 3 o'clock in the afternoon. The next day the party will leave San Jose for Del Monte, taking luncheon there at 2.30 in the afternoon. Club house privileges will be accorded the visitors. The Del Monte Hotel management has offered special prizes for a time limit run around the 17 miles drive.

British Imports and Exports.

British imports of foreign cars and parts during the month of April fell away no less than \$716,725 as compared with the returns for the corresponding period of last year. Only 480 complete cars were imported, which together with the 228 chassis and parts to the value of \$610,680, brought the total importation to \$1.920.7 5, as against a total of \$2,637,490 last year, and \$2,016,145 for April, 1906. The business of exporting British products to foreign ports revealed a small gain. There were exported 168 cars, valued together at \$291,-230; 18 chassis, valued at \$37,365, and parts to the value of \$163,260, making a total of \$491,855 a \$30,000 gain over last year.

Big Wheat Crop Makes Brisk Business.

"Whatever may be the case in other parts of the country," one day this week remarked a man in the trade, who is in position to speak by the cards, "business in that part of the United States that lies between Chicago and Denver is as good as any one can ask; and when I say 'business,' I mean not merely the bicycle business, but business of all sorts. The farmers have money and are spending it, and, as the official statistics show the wheat crop as being one of the largest on record, there seems no reason why the present conditions should not continue."

Southern California Dealers Elect Officers.

Without opposition the following officers were elected by the Automobile Dealers' Association of Southern California: President, William E. Bush; vice-president, R. C. Hamlin; secretary, H. O. Harrison; treasurer, Captain H. D. Ryus. The retiring secretary's report showed that \$1,181 remained in the treasury at the close of the fiscal year.

SUMMER MEETING OF ENGINEERS

Program of Business and Pleasure at Detroit—Who Will Speak and What Will be Discussed.

Preparations for the annual summer meeting of the Society of Automobile Engineers, which will be held in Detroit, June 25-27, are now complete, and the program prepared by the special Detroit entertainment committee gives promise of one of the most interesting gatherings that the Society has ever had. The meeting will be opened Thursday a. m., June 25, with a business session of the Society, followed by attendance at the launching of a 10,000-ton lake steamer in conjunction with the American Society of Mechanical Engineers. One of the local plants will be inspected in the afternoon of that day, and in the evening papers on "Autogenous Welding," by E. S. Foljambe, and "The Storage Battery in Automobile Work," by Bruce Ford, will be read.

Friday morning the members will join in the continued discussion of the paper on "Clutches," by Henry Souther, at the session of the A. S. M. E., and in the afternoon a trip will be taken up the St. Clair in a steamer. In the evening a dinner will be held, and it will be followed by the reading of a paper on "Some Recent Developments in Magneto Ignition," by Otto Heins; a number of lantern slides, showing the development of the gas engine ignition during the past 25 years, will be shown.

Saturday morning the plant of the Packard company will be visited, followed by a luncheon tendered the society at the Detroit Boat Club by J. G. Rumney, of the Detroit Steel Products Co., and there will be an automobile run through Belle Isle Park and environs during the afternoon. In the evening there will be a business session, followed by the reading of papers on "The Unit System of Power Transmission," by Frank Beemer, and "The Increased Efficiency of Single Motor Drive," by A. L. Dixon.

The Detroit committee of arrangements is composed of H. E. Coffin, chairman. Henry Ford, Russell Huff, James H. Herron, and Alanson P. Brush.

Two Big Companies May Consolidate.

What has been known for several weeks to many persons in the trade finally has found its way into print, i. e., a mooted consolidation of the Buick and Maxwell-Briscoe companies. Some reports state that the deal practically has been completed, but those most interested deny these statements. Before mestion of the matter appeared in print, Benjamin Briscoe, while admitting that negotiations were in progress, stated that any mention of the subject would not be relished.

He'll get you sure!

YOU CAN'T ESCAPE!

There's only one way out of it—you cannot "protect" against the puncture devil, even by overloading your wheels with heavy armor which destroy the resiliency of your tires.

Why not meet your puncture face to face and when he stabs your tire, laugh him to scorn—produce your

STEPNEY SPARE WHEEL

and be on your way in less than a minute.

The Stepney Spare Wheel clamps to the rim of your wheel without removing your punctured tire.

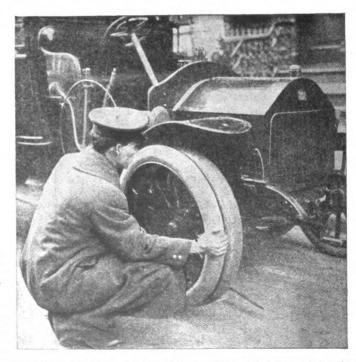

When you finish your journey remove the Stepney and repair the puncture.

Beware of the Cheap Inner Tube!

One of several factors that brought discomfiture to the bicycle industry and which caused, and still is causing, much annoyance to riders, was the tire built for sale rather than for use. And what has been, and to a limited extent now is, true. the bicycle business, is becoming evident in the automobile trade. While reputable tire manufacturers take pride in their product and have their name and trade mark appear prominently on every article which they produce, the maker of another grade of goods has no such feeling toward his output and sends forth his production with neither name nor sign to designate its "birthplace."

The nameless tire seemingly has one attraction, its price. But it is a fleeting attraction; for cheap tires, like other cheap wares, are the most expensive in the end, and "the end" is not for off. Fortunately

for bargain hunters, not much has been done by unknown concerns in the matter of making outer shoes or casings, but of late there have been numerous outcroppings of unbranded and nondescript inner tubes. With neither name, number, nor distinguishing mark, and without reputation or with an unmeaning guarantee, they are offered to automobilists "at a price." They were produced for no other purpose.

It is recognized that the life of a tire is affected by the heat to which use subjects it. In the hot days of summer the heat of the pavement adds much to the heat generated by the compression of the air contained in the tire, and the cheap production of second hand rubber will stand but little of this strain before it becomes an annoyance and source of continual trouble. Undoubtedly, the nondescript inner tube will this summer cause much trouble for which the maker of the casing will be damned, and whether the latter will not be justified in taking measures to protect himself is a pretty question, the answer to which inclines strongly toward an affirmative. The reputable manufacturer of a high class casing has a right to expect that it will not be used in connection with a cheap tube; for in many respects the quality of the tube is quite as important as the quality of the remainder of the tire.

Advance of Moderate Powers and Prices.

An inevitable consequence of the vast development which has come over the industry is the stratification of the market into sections or groups of vehicles each of which is characterized by qualities answering to the needs of a specific class of users. Viewed in this light it is possible to discern a growth in favor on the part of the car of medium power and medium price which would be simply amazing were its causes not distinctly apparent.

How rapid this growth is, may not become readily appreciable until the end of this season, or even later. But the relative volume of business done in cars of say, 20 to 30 horsepower, and costing somewhere about \$2,000, is a token which has not been lost on the makers. A large number of such cars are already on the market, and their popularity, as a class, is unquestionable. Still others are in process of construction, however, which are destined to create no small stir when their features and their origin are announced.

While the moderate priced car always has

been pre-eminently the American product, such a movement in the foreign market last year and this, resulted in the production of a great number of such cars, by makers who up to that time had been identified only with the most exclusive and costliest vehicles. Their success may be taken as a forecast of the extension here by makers of the same class.

The crux of the matter is this: The motorist, instead of the maker, is beginning to dominate the market. He is learning to demand what he wants, even as he has learned his requirements—in a positive fashion that is not to be gainsaid. The value of display, of luxurious fittings and high power are being contrasted with the actual enjoyment which may be derived from them. The individual buyer is learning that certain types of machine are as unfit for him personally as they may be appropriate to others. Users are beginning to buy cars strictly within their means.

Special Performances and Their Effect.

Buyers of new cars, in their enthusiasm and confidence are largely in a class by themselves. Usually their faith in the recent acquisition is unbounded, their credulity as to its powers childlike, and their dejection when it fails to come up to their fullest expectations pathetic. For it frequently happens that new cars do not develop as well as they are expected to, and though a large amount of such failure may be charged to the poor adjustment and stiffness of new mechanism, there are several other causes which lead to the same result and which breed discontent for the owner as well as unhappiness for the agent with whom he deals.

Perhaps the most moving cause instrumental in undermining the new owner's opinion of his new machine is the purely human one best expressed in the ancient text for lyceum debate beginning: "The pleasures of anticipation—" and setting forth how the apple does not always taste as good as it looks. The wholly natural shortcomings of the new mechanism are more momentous when it has been in use just long enough to have grown familiar, than when a longer acquaintance has made clear their causes.

Another reason for discontent is the contrast drawn between the performance developed by the demonstrating car when on trial, and the performance developed by the private machine when driven by its owner,

not to mention the contrast between the demonstrator's stories of what can be done with it, and the facts as they appear to the buyer. The invariable tendency is not to make proper allowance for the splendid performance of the specially tuned demonstrating machine in expert hands, and to be over-credulous in accepting the recommendations of the salesman or driver, whose eagerness to succeed and whose partiality to the machine in question offer a strong temptation to the tracing of nebulous rainbows.

In all this, the wise dealer may find food for thought. The time has passed when the salesman of integrity will permit a machine to go into the hands of a driver who is not familiar with at least the rudiments of good driving and car maintenance. Many dealers go far beyond the actual requirements of the case by insisting upon overlooking the training of the owner and supervising the early performance of the machine, merely for the purpose of ensuring for it a creditable performance. And it is a particularly hopeful sign that the proportion of dealers of this class is especially great among those who handle low and medium priced cars.

Nevertheless in many cases the new owner is encouraged in establishing an expristant valuation on the ability of the machine. The desire to excel in sales business produces a strong temptation to the use of the spectacular in demonstration and publicity work, and while the dealer, or the manufacturer himself, may have no intention of producing the impression that the car will thrive under such treatment, or will give such results under any sort of handling, such an impression is apt to be fostered by an over-zealous method.

The maker with the reputation—the maker who succeeds—and the agent who succeeds, are the hard headed business men who so contrive as to crystalize first impressions into lasting impressions, and to make the performance realized even more gratifying than the performance anticipated. It is a difficult undertaking. But it is possible to enumerate more than one growing business of which this is a characteristic.

Tinkering that Injures Reputations.

It is a queer phase of human nature that prompts a man, who would not permit of anyone but a first class jeweler resetting a stone in his wife's ring, to allow his chauffeur, or his mechanic—if he employs one—to make alterations in the running mechanism or power plant of an equally or more expensive automobile; and yet how often is this done.

While it stands to reason that the mechanism of a car must be considered in its entirety, i. e., that each part is closely related to every other part, and while any one with a grain of sense must realize that manufacturers and designers have as many or greater opportunities than private chauffeurs or mechanics for observing and studying the designs and ideas embodied in other cars, yet owners will permit alterations to be made or devices incorporated by their own employes, until frequently it is true that a well built, efficient car acts like a mule or becomes much like a junk wagon.

Often where a transmission case is designed to be lubricated by heavy oil, the chauffeur finds that, for personal reasons, he would prefer to use grease. The owner listens to the arguments in favor of the latter, which his employe advances, and then gives his consent for such alterations as may be necessary—or thought to be necessary. The transmission case is taken apart, oil screens are removed, large holes are drilled here and there, grease cups are substituted, and almost radical alterations are made. Like as not a grease reservoir becomes a part of the dashboard equipment and a pipe from it is run through the flooring and around the levers until finally it terminates in a coupling and bushing which goes into the transmission case; and what was a simple lubricating system thus becomes a complicated series of piping, grease cups and what-not. And merely because the chauffeur recommended it.

Obviously when a car has gone through any such alteration, the manufacturer's responsibility for its performance ceases. The car has been guaranteed to do certain things but the guarantee applies only if the mechanical construction remains intact. It is not to be expected that any manufacturer will shoulder the responsibility for the acts of an independent mechanic and naturally he will not assume the blame nor claim the credit for a car which has undergone radical alterations after it has left his control.

It is safe to assume that the way to obtain the best results from any article is to leave well enough alone. So called "improvements" seldom improve. It is rare that the chauffeur or chauffeur-mechanic

COMING EVENTS

June 13, Cleveland, Ohio—Cleveland Automobile Club's annual hill climb.

June 13, Philadelphia, Pa.—Quaker City Motor Club's race meet at Point Breeze track.

June 13, Cleveland, Ohio.—Cleveland Automobile Club's hill climbing contest up Cady hill.

June 18, Washington, D. C.—Washington Lodge of Elks' race meet at Bennings track.

June 20, Oakland, Cal.—California Woman's Automobile Club's endurance run to San Jose and return

June 24, 25, 26 and 27, Chicago, Ill.—Chicago Motor Club's 1,200 miles reliability run to Dixon, South Bend, Joliet and Chicago.

June 24, 25, 26 and 27, New York and Philadelphia—Monroe County Automobile Association's dual reliability run to Stroudsburg, Pa., and hill climbing contest and carnival at Mount Pocono.

June 27, Norristown, Pa.—Norristown Automobile Club's hill climbing contest on Skippack hill.

June 30, Rockville, Conn.—Rockville Automobile Club's hill climbing contest on Ned England hill.

July 34, Wildwood, N. J.—Motor Club of Wildwood's annual automobile carnival.

July 4, Cape May, N. J.—Quaker City Motor Club's race meet and carnival.

July 4, Lowell, Mass.—Lowell Automobile Club's 250 miles road race on Merrinac boulevard.

July 9, Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

July 15, Huntington, N. Y.—Huntington Automobile Club's carnival and races.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

can improve on the mechanical design of one whose life work is designing.

If a car does not suit, buy one which does, but do not attempt to make over one to accomplish the purposes of some other, and above all things, don't let a chauffeur have free rein to make "improvements" until the maker of the car has expressed an opinion as to whether or not the proposed changes will prove beneficial. Chauffeurs have a fiendish inclination for "tinkering," and "tinkeritis" has become the mainstay of many repairmen who live by undoing the mistakes of would-be "experts."

AMERICAN ROAD RECORDS SLASHED

Twenty-six Fast Events on Straightaway
Course at Jamaica—Big Day's Sport
Without Hitch or 'Accident.

Everybody from Queens, a number of persons from Kings, and some from other counties journeyed out to what is known as Hillside avenue, near Jamaica, Long Island, on Friday, 5th inst., to witness the straightaway speed trials. Thousands of spectators lined the course, the grandstands at the finish were comfortably filled, while hundreds of cars parked in good positions along the smooth level boulevard.

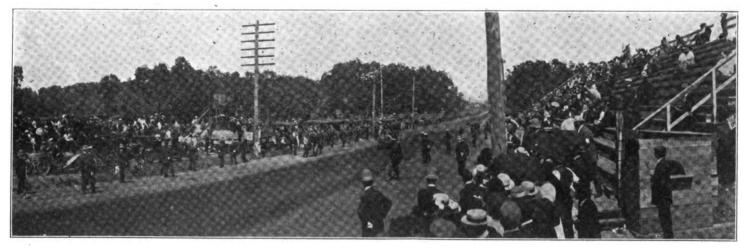

formance of each car was announced within five seconds of the time it flashed by the red flags denoting the finish tape.

The twenty-six events were run at three distances—one kilometre, one mile and two miles—with several classes at each distance. All American road records were broken. Harry Kilpatrick, driving the Vanderbilt cup race Hotchkiss car, made the fastest times of the afternoon. In the kilometre trials he scored 24½ seconds in the free-for-all, a rate of 90 miles an hour. In this event Morton Seymour in the Christic car finished second in 26½ seconds. While practicing the day before Seymour had broken the radiator off the Christic car and it could not be replaced in time for the meet. As the result Seymour was afraid

won in the mile trials, covering the distance in 57½ seconds. McDermott was second and Woods third.

In the class for four cylinder cars selling above \$4,000, Stearns cars made the fastest time in all but the one mile, which was won by Caleb Bragg, De Dietrich, in 51% seconds. The Stearns also won all three of the six cylinder events.

One class that attracted a great deal of attention was that for Briarcliff cars, those with piston displacement of 301 to 550 cubic inches. John Lang, driving a duplicate of the car which won the Savannah challenge trophy and the Briarcliff cup, was victorious three times. He covered the kilometre in 273% seconds, and the mile in 421% seconds, while his time for two miles

TYPICAL VIEW OF THE COURSE AT JAMAICA, SHOWING A SPEED TRIAL

It was "automobile day" of the subway celebration that Jamaicans have been holding, and in the excitement of watching the automobiles fly over a stretch of road at much better than a mile a minute, the side show features of the celebration, such as wild west shows, baseball games and balloon ascensions, were entirely ignored.

With no less than 26 events on the program it is not surprising that the meet lasted until after some persons' supper hour, but at that the events were run with better dispatch than was thought possible and almost every car came in for honors. One might naturally suppose that in a meet of this character the most attention would be given to the big racing cars, but such did not seem to be the case. After several stock cars covered the different stretches at rates of speed better than a mile a minute the crowd began to focus its attention upon the stock cars, and the drivers of this class machines received just as much applause after a record-breaking run as did the pilots of the mastodons.

The policing and official arrangements were excellent and there was not a hitch from start to finish. The police made it impossible for the crowds to encroach upon the course and there was no long waiting for the announcement of times. The timing was done automatically and the per-

to go farther than one kilometre because of the danger of overheating. Kilpatrick covered the mile in 38¾ seconds, a rate of 93.3 miles an hour, and in the two miles trials his time was 1:19½. The special event for the Jefferson DeMont Thompson cup, at two miles, also was won by Kilpatrick in 1:20½. In the one mile free-forall George Robertson in a Fiat was the runner-up, finishing in the same position in the two miles event. John Lang, Isotta, was second in the race for the Thompson cup.

Mitchell cars had things their own way in the classes for cars under \$1,250, O. R. Delamater winning all three events at the various distances. C. P. Skinner, Mitchell, was the runner-up in two of the events. An Acme car, driven by C. A. Patchske, did the same stunt in the class for cars selling between \$1,251 and \$2,000, while Leonard Zengle, Pennsylvania, made the best time at the three distances when the class for cars from \$2,000 to \$3,000 was decided.

Honors were divided in the class for cars costing between \$3,001 and \$4,000. In the kilometre trials W. A. Woods, Cleveland, beat J. P. McDermott, Stevens-Duryea, by nearly seven seconds, and in the two miles event W. W. Burke, Mora, beat Woods, who in turn finished in better time than McDermott. T. F. Cheesborough, Thomas,

was 1:29%. These figures were equalled only in the free-for-all. The loss of Emmanual Cedrino, who was killed before the Pimlico races in Baltimore, on the Fiat car, was keenly felt. Cedrino had been expected to drive the Fiat in these events, but his place was taken by J. H. Parker. Parker made a good showing, but he could finish only second to Lang each time. J. M. Seymour, on a Simplex, got third place in all three events.

Mitchell cars were the heaviest scorers among the American cars, with the exception of the big Stearns, which competed in more events. Mitchells won three firsts and two seconds, and with five points for a first and three points for second place, it ran up a total of 21 points, as shown in the following table:

Car.	1st	2d	3d	Pts.

Lowell Race Plans Encounter Opposition.

A. P. Hedrick, Pope-Hartford . 0:58

It seems scarcely probable that the projected 250 miles road race in Lowell, Mass., will be run despite the fact that the common council had voted to grant the exclusive use of certain streets by the Lowell Automobile Club "for the purpose of speed tests on July 4th." The Lowell Automobile Club had laid out a 10 miles course through and around the city, and when the consent of the council had been obtained, not alone for the race, but for daily practice drives between the hours of 4 a. m. and 6 a. m., for the seven days previous to the 4th, they planned to have the biggest automobile race ever held in Massachusetts.

But their hopes have been dashed to earth. The city solicitor has rendered an opinion that the council has no authority to set aside streets for such a purpose. As a result of this opinion, the mayor has refused to sign the order, and the acting governor of the State has notified the automobile club that the law will not permit him to grant the club's request for the use of the State militia to patrol the course of the proposed race.

And if these set-backs are not sufficient to discourage the promoters of the contest, there is another in the shape of court proceedings which are threatened by a committee of tax payers who will apply for an injunction restraining the contestants from using the course, on the ground that public safety would be endangered by the running of such a contest.

Strange to say, however, the Waltham authorities have granted permission for a repetition of the motorcycle road race which was held July 4th last year. At that time. when the legality of the procedure was in question, Secretary Fletcher, of the State Highway Commission, called the Mayor of Waltham to task, but later "drew in his horns" and pleaded that the commission had no right to interfere.

GREAT SPORT ON DEAD BORSE HILL

All Local Records Shattered at Worcester's Annual Climb—20,000 Spectators Present—Only One Near-Accident.

From every standpoint—numerical, sporting, social and record-breaking—the third annual hill climbing contest of the Worcester Automobile Club held on Dead Horse hill near that city on Saturday afternoon last, 6th inst., was a pronounced success, results being better than even the sanguine expectations of the promoter had hoped for. The weather was ideal and a crowd estimated at 20,000 enthused over the events.

run. The first away was J. B. McKinney's Peerless, and it reached the summit in 1:15\(\frac{1}{2}\)s. Then came L. Lorimer, Thomas Detroit, and he finished in three-fifths of a second faster. These two drivers, with the addition of Morgan Kent, Stearns, made up the event for gasolene cars from 40 to 60 horsepower, and McKinney won in 1:16. The event was remarkably contested as Kent's time was 1:16\(\frac{1}{2}\)s and Lorimer's 1:16\(\frac{1}{2}\)s.

It was in the free-for-all that the crowd began to get excited and in this event were scored one of the two fastest times of the climb. L. F. Baldwin, driving a Stanley steam car, won the event in 57%, with Haupt, Chadwick Great Six, a close second in 59 seconds. This was the fastest time made by any gasolene car during the day.

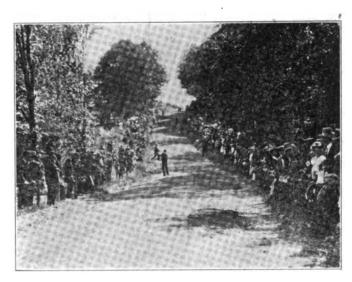

The crowd held its breath once when the limb of a tree broke and a venturesome young fellow started to parachute toward the earth, clutching the broken branch in one hand. However, as he passed another limb, he reached out and clung to it safely.

limb, he reached out and clung to it safely.
"Send the ambulance quick," megaphoned
Murphy to the official stand, "There's a
broken limb to be set."

Of course the crowd laughed as it did later when one facetious local wag named Batter came up and asked Murphy the score. "Batter out," said Murphy, giving the man a push back into the line, and then he lighted a cigar. This last pun rather frazzled his nerves. Taken all in all the hill climb was a success with a big "S," and the crowd seemed sorry when Announcer Murphy told

VIEW LOOKING UP THE HILL

When the gasolene laden atmosphere had cleared it was found that L. F. Baldwin, of Providence, had shattered all records for the club, doing the one mile grade in 55% seconds. The old record was 1:01%. William Haupt, who carried off the honors at the Wilkes-Barre climb, made the best time for gasolene cars, doing it in 59 seconds.

For general all round honors the Thomas-Detroit cars made a great sweep, cleaning up four first prizes, three seconds and two thirds. Stevens-Duryea cars ran away with two of the events in which they were entered. These were captured by the "Little six", as the "big six" was protested on account of the shape of its body. The Peerless car got two firsts and two seconds. The Maxwell scored a first and a second.

The events were handled admirably and there were no delays and not an accident was reported during the afternoon. Everything went along like clockwork, and the first cars started nearly on time at 1.30 p. m., and the last car had climbed the hill at 5 o'clock. The hill was in better shape for racing than it was last year, as it had been treated with a preparation of calcide that kept down the dust.

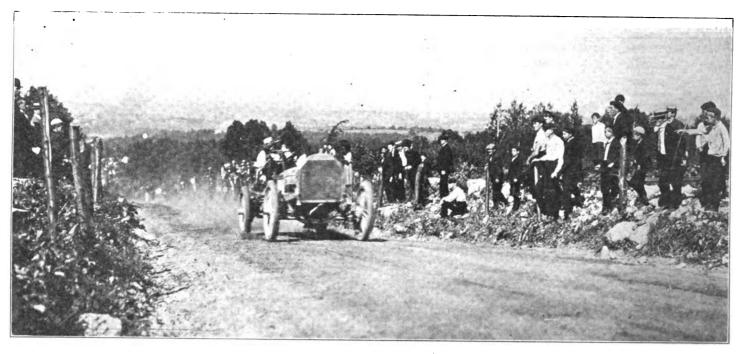

The first event started was for high-powered gasolene cars and only two made the It was in the exhibition trials that Baldwin broke the record for the hill when he steamed up in 553% seconds, a remarkable flight. Haupt also essayed the trials and his time was four-fifths of a second slower than in the free-for-all. The nearest approach to an acident was when Haupt made his first trial. He was steering with one hand when he ran over a stone in the roadway near the finish. The big car swerved and for an instant it looked as though the judges' stand would be swept out of the way. Haupt recovered control in a second and guided, the car back on the course and across the finish line.

F. D. Everett, driving a steam car, won the Worcester county amateur championship in 1:16. J. S. Harrington, Thomas-Detroit, was the only other contender, but he made a close race of it by reaching the summit within four-fifths of a second of Everett's time.

It takes many little things to make up the interest in a hill climb and one person that contributed a great deal to the success of the Worcester event, not discounting the excellent work done by the officials in running the events off in record-breaking time, was "Jim" Murphy, the man with the megaphone. Murphy let loose a lot of Irish wit.

the crowd to get ready for the great "Supper Handicap Retroclimb," which he explained would run downhill, the destination being wherever their supper "steaks" happened to be broiling. The summary:

F. L. BALDWIN, STANLEY, BREAKING DEAD HORSE HILL RECORD

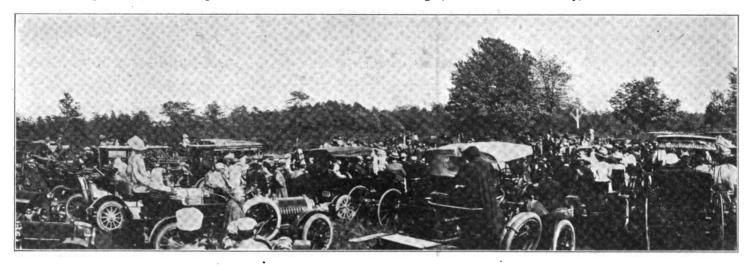

WORK BEGINS ON MOTOR PARKWAY

Pardington Turns First Sod and Blows up Thirty Trees—Addresses by Vanderbilt, Hotchkiss and Others.

After 18 months of promise, the Long Island Motor Parkway assumed tangible proportions last Saturday afternoon, 6th inst. when the work of constructing the first section was inaugurated with befitting cere-

was presented by Mr. Pardington. After paying tribute to the revolutionizing tendencies of the automobile, some of the trials attendant upon the inception of the immediate project were recounted.

'We are here to-day to celebrate the commencement of work on a road, which when completed, will give the world one more mode of transportation," Mr. Pardington read. "There have been in the past highways for all kinds of vehicular traffic, canals for the movement of freight, railroads of way many unforeseen obstacles. But land owners in almost every case, seeing what a benefit a road of this character would be to their property, gladly came forward with help, enabling us to complete a 45-mile right of way. Now came the panic. Hard times were ahead, and it looked serious for the undertaking. Discouraging reports were circulated and other difficulties appeared. Nevertheless, with all these trials and tribulations, money slowly came into the treasury, and one obstacle after another

ASSEMBLAGE GATHERED TO WITNESS BEGINNING OF WORK ON MOTOR PARKWAY

monies on what is known as the "Barnes Tract." on the Jerusalem road, near Central Park, L. I. In the absence of W. K. Vanderbilt, Jr., president of the company, who, because of the critical illness of a relative was unable to be present, A. R. Pardington, the general manager of the Parkway company, assumed the initiative in turning the first spadeful of earth and pressing a button which set off thirty charges of

for the transportation of passengers, and trolleys for the convenience of those living in the suburbs of our large cities, but in no case has the motorist been considered.

"Although but a few years in existence, the automobile has come into such prominence that it has revolutionized all modes of travel. Distance has been eliminated, highways improved, unknown districts opened up, and pleasure given to thousands.

was set aside. So that here we are, 18 months from the time the company was incorporated, ready to turn over the first spadeful of dirt, and this fall will see ready for use ten miles of Motor Parkway."

Speaking of "The Occasion and Its Meaning." Judge William H. Hotchkiss, president of the American Automobile Association reverted to the tendencies of motor traffic to turn the current of population

MUSIC AND ORATORY PRECEDE GROUND BREAKING

A. R. PARDINGTON TURNING THE FIRST SOD

giant powder, ripping up as many trees which encumbered the right of way, and thus signaling to the hundred laborers who were at hand, to commence operations.

Previous to this spectacular demonstration, a number of addresses were read, including one which had been prepared by Mr. Vanderbilt, but which in his absence And now the day of the automobile has come. A highway is about to be constructed for its use, free from all grade crossings, dust and police surveillance and a country opened up whose variegated charms are hard to equal in any part of the world.

"We have encountered in our preliminary work of raising funds and procuring right away from the cities, and building on the idea of the Motor Parkway, forecasted the probable extension of such schemes, and even suggested the possibility of elevated motor roadways connecting the great cities with such trunk lines of automobile traffic.

"To-day at this place, the motor vehicle, as it were, takes to the rails," he said.

"Like its predecessor, the steam car, it too has found the public roads at times uncomfortable. . . . If there was need for such a road as this—and no one here will gainsay such need—is there not need for similar roads near other great centers of population, and will they not certainly be built?

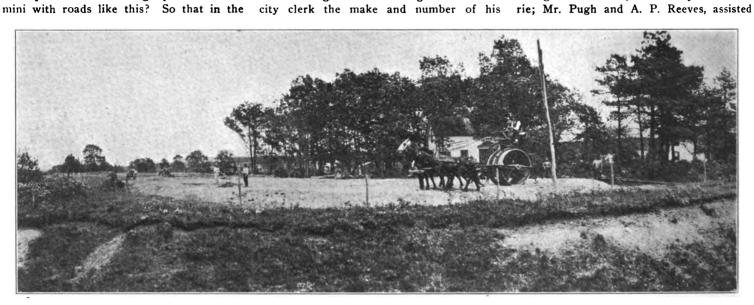

"Carry the thought further. If such needs exist, how long will it be before the cities, particularly our great metropolis, yielding to the demands of a majority of the people—for sooner or later a majority will drive motor cars—will build elevated steel pavements up and down and across their precincts connecting up at their termini with roads like this? So that in the

Suffolk county. There will be no grade crossings, either with highways or railroads, and the entire course will be over a private right of way, properly fenced and safeguarded, and will be 100 feet in width and about 50 miles long. The estimated total cost of the enterprise is set down at \$2,000,000 or thereabouts.

Utica Requires Local Registration.

Although the State law requires the registration of automobiles, the common council of Utica, N. Y., has made a radical move by enacting an ordinance calling for local registration. It requires every automobile owner living in Utica to register with the city clerk the make and number of his

furnished the lunches free for everyone. The parade was divided into ten divisions. and was made up of children from the Hebrew Sheltering Guardian Society, New York Home for Destitute Crippled Children, Phelps School and Home for the Children's Aid Society, Industrial School of the Children's Aid Society, Leake and Watts Orphan House, Protestant Half Orphan Asylum, Howard Mission and Home for Little Wanderers, and the Mott Street Industrial School. Those in charge of the divisions were: Col. G. C. Pardee, assisted by J. F. Plummer; Mr. Broadhead and Mrs. J. N. Cuneo, assisted by Mr. Disbrow; George W. Bennett, assisted by F. C. Car-

ROAD MAKING ON THE LONG ISLAND MOTOR PARKWAY

end we shall have pavements and roads built for the motor vehicle and to be used only by it."

August Heckscher, a director of the Parkway corporation, who has long been identified with the good roads movement on Long Island, spoke of the importance of the Parkway as an accession to the rapid transit of the local resident. A no less significant phase of the benefit to be derived from the realization of the plans under way, namely their effect on the realty values of adjoining territories, was discussed by Milton l'Ecluse, representing the Long Island Real Estate Exchange. The appreciation of the affiliated motorists was voiced by Russel A. Field, secretary of the Long Island Automobile Club, while John C. Wetmore. the orator of the New York automobile press, also delivered a few earnest words.

The present plan is to complete 10 or 12 miles of the Parkway this summer. A section, 22 feet in width and running from Central Park, L. I., to Lake Ronkonkoma, will be ready by the 1st of October, it is promised, and will be used as a porton of the course for the forthcoming Vanderbilt cup race. Ultimately the parkway will stretch from the Brooklyn city limits to Riverhead near the shore of Peconic Bay,

machine. No registration fee is required; the object of the registration being "to identify those who violate the speed ordinance.' It is not easy to determine the necessity for this local ordinance as the provisions of the State law cover the same object. However, 88 cars have been registered, and other owners may or may not follow suit as they see fit, no penalty having been provided for failure to obey the law.

New York Orphans on Their Outing.

Minus some of the circus characteristics which have been much in evidence on similar occasions in the past, the fourth annual automobile outing of New York orphans occurred on Tuesday, 9th inst. While there was lots of enthusiasm amongst the youngsters as they prepared for their trip to Luna Park, which had been donated for the day by its proprietor, there was a moderation on the part of the givers which made the affair more like an act of benevolence than a press-agented display of unfortunate little ones.

Fifteen hundred children shared in the good time. The automobile dealers contributed 140 cars and R. M. Owen, the New York agent for the Reo and Premier cars,

by F. Cimiotti, Andrew J. Cone and I. H. Manning.

Gliddens Rest from Globe Girdling.

Having travelled 46,528 miles of the 50,000 which they purpose travelling, Mr. and Mrs. Charles J. Glidden returned to New York on the Campania last Saturday. On their last trip these installment globe girdlers drove through Syria, being the first American automobilists to take a car into that country. They also visited Italy, France, Monaco and Egypt. In many parts of the old world the governors of the various provinces provided armed guards as an escort. Mr. Glidden said the armed guards were necessary in Egypt to protect travellers from bands of Bedouin brigands. The Gliddens visited the Holy Land, and when they arrived at Jerusalem about 10,000 natives inspected the machine. He said the roads in Syria were fearful and it was often necessary to have the car pulled along over bad stretches.

Eight events have been scheduled for the meet to be held at Wildwood-by-the-Sea, N. J., on July 4th. It will be preceded on July 3d by a regularity run from Philadelphia.

OMAHA SEES FIRST HILL CLIMB

Nine Events Well Contested on West
Dodge Road—Nestman Makes Best
Time up One-Mile Slope.

Omaha's first hill climb held on Decoration Day on the mile incline on the West Dodge road, attracted about 2,000 people and was pronounced a success, although the officials had the time of their lives in keeping the course sufficiently clear for the contestants to start. After the first three events the crowd seemed to realize the danger of standing in the way of the oncoming machines and then the meet ran smoothly.

The nine events were well contested, the chief prize in each being a silver cup, donated by the promoter, the Omaha Automobile Club. A variety of merchandise, donated by the merchants of the city, made up the subsidiary prizes, revolvers, a dozen live squabs, a briar pipe, brass humidor, and a box of cigars being among the list.

O. P. Nestman, driving a Stevens-Duryea, made the fastest time of the day when he climbed the mile slope in 1:16 in the free-for-all event. G. B. Craven, Buick; Charles Smith, Stoddard-Dayton, and Brick Kuhn, Holsman, were among the other prize winners. The summary:

Gasolene cars listed at \$1,000 and under—Won by G. B. Craven, Buick, 1:47%; second, A. C. Hartman, Buick, 1:49.

Gasolene touring cars listed between \$2,250 and \$3,000—Won by Charles Smith, Stoddard-Dayton, 1:223; second, Carl Holt, Rambler, 1:513.

Gasolene cars listed between \$1,000 and \$2,000—Won by A. C. Hartman, Buick, 1:44; second, Carl Holt, Mitchell, 1:451/4; third, Berger, Buick, 1:491/5.

High wheel motor buggies—Won by Brick Kuhn, Holsman, 2:534%.

Gasolene touring cars listed between \$3,500 and \$4,250—Won by Charles Smith, Stoddard-Dayton, 1:23½; second, O. P. Nestman, Stevens-Duryea, 1:25½; third, O. C. Shea, Packard, 1:27½.

Gasolene runabouts listed between \$2,100 and \$3.000—Won by Charles Smith, Stoddard-Dayton, 1:23; second, O. P. Nestman, Knox, 1:25; third, A. H. Fetters, Stoddard-Dayton, 1:28.

Exhibition against time—By R. R. Kimbill, Stanley, 1:20.

Gasolene cars. free-for-all—Won by O. P. Nestman, Stevens-Duryea, 1:16; second, Charles Smith, Stoddard-Dayton, 1:251/5; third, Rollo Smith, Thomas, 1:281/5.

Gasolene cars costing \$4,000 and over—Won by O. P. Nestman, Stevens-Duryea, 1:19½; second, H. C. Carr, Packard, 1:20½; third, Charles Smith, Stoddard-Dayton, 1:22.

Oregonians See Their First Road Races.

With characteristic western enthusiasm 10,000 people witnessed last Thursday, 4th

inst., the first road race ever conducted in that part of the Pacific coast. The two events were conducted by the Portland (Ore.) Automobile Club. One was a race of 58.4 miles, the other of 102½ miles.

The course had been oiled and scraped and throughout its entire length of 14.4 miles was patrolled by the State militia. The cars, however, had hard luck; tire trouble played havoc with most of them, and of the seven starters in the shorter race only two finished.

The winner was H. M. Corey, of Portland, who drove a Cadillac over the 58.4 miles in 1:13:20. William Slimmons, of San Francisco, in a White, was second, in 1:20:44. The 102.4 miles race had 11 starters, but only three finished. H. Bell, Spokane (Studebaker), won in 2:04:08; second, N. R. Cooper, Seattle (Studebaker), 2:18:47; third, Fred Dundee, Rutland (White), 2:28:59.

Microscopic Measurements for Grand Prix.

"Splitting hairs" is not in it with the exactness with which the measurements are being made of the cars entered for the Grand Prix, as was made plain when Count de la Vallette, the measuring official of the sporting committee of the Automobile Club of France recently arrived in England for the purpose of measuring and stamping the cylinders of the English entrants for the race.

The Count was supplied with gauges which were passed and stamped by the French government. He made the statement that his gauges had been certified to be 155 mm. at 15° C, and were so sensitive that if warmed by the heat of his hands they would not enter any cylinders that would be accepted for the Grand Prix. The Count further declared that when he had warmed the gauges by holding them in his hands, he would not pass any cylinder that they would then enter.

It also was announced that the gauge for the overall outside width of a car consisted of two rigid gate posts set at the exact width, through which all entered cars would would be required to pass. All cars would have to be equipped with a crank case and a transmission case so arranged as to make it possible to look into them, so that there could be no doubt that the oil was entirely drained before weighing. If this arrangement could not be made the bottom of the cases would have to be removed.

The French official also was responsible for the statement that most of the French entrants were designed with all of the valves on one side, and that they were long stroke engines with small valves.

At the annual meeting of the Cedar Rapids (Iowa) Automobile Club the following officers were elected: President, E. C. Clark; vice-president, Dr. W. J. Morrison; secretary, A. E. Durin; treasurer, J. L. Bever, Jr.; club captain and steward, G. M. Averhill.

HAMLIN FIRST IN HALF CENTURY

Establishes a Pacific Coast Record at Los Angeles Meet—Kussman in Native Car Wins Two Events.

Before a crowd of 5,000 spectators at Agricultural Park track, Los Angeles, Saturday afternoon, 30th ult., Ralph Hamlin drove a Franklin "six" 50 miles in 57:43. His fast ride establishes a record for the Pacific coast for stock cars on a circular track. Three miles before the finish an official in the judges' stand signalled Hamlin to slow down, and if it had not been for this unaccountable interference Hamlin probably would have made even better time. probably would have made the distance in even better time.

starting in a two-bunch lineup in this order: Ralph C. Hamlin, Franklin; George Kussman, Tourist; Seifert, Stoddard-Dayton; Hal Stone, Pullman; Lester Pattee, Cadillac; McGeehee, Cartercar; Dan Kuhl, Stearns; Gregory, Moline Limited, and George Barnes, Haynes.

Hamlin took the lead at the start and for 23 miles did not have to take the dust for any of them. In the 21st mile Seifert began to crawl up and after a neck and neck spurt lasting several laps he passed Hamlin. The excessive speed proved disastrous to Seifert, however, and at the 35th mile Hamlin had regained the lead. From then to the finish it was nothing but Hamlin, and he lapped Kuhl and Pattee coming into the stretch of the 37th mile. In the next mile Seifert withdrew. The remaining 12 miles were covered with the first three cars in the same relative positions, Kuhl getting second, and Pattee third. Barnes had been compelled to quit after running 16 miles in fast time and the other drivers had gone these distances when the race was finished. Stone, 36 miles; Mc-Geehee, 34; Kussman, 35, and Gregory, 30 miles.

Only two drivers lined up for the five miles for small runabouts, and Gump, Jackson, was unable to make any kind of a showing against Roe, Ford. The former quit after two miles and the latter enjoyed a walkover finish in 4:3236. The summaries:

Three miles for runabouts costing \$900 and under—Won by A. E. Roe, Ford; S. N. Gump, Jackson, did not finish. Time, 4:3236.

Three miles for touring cars costing \$1,600 and under—Won by George Kussman, Tourist; second, McGeehee, Cartercar. Time, 4:051/5.

Five miles for cars costing \$1,601 to \$2,-500—Won by George Kussman, Tourist; second, Seifert, Stoddard-Dayton; third, Copeland, Jackson. Time, 6:19.

Fifty miles free-for-all stock cars—Won by Ralph Hamlin, Franklin; second, Dan Kuhl, Stearns; third, Lester Pattee, Cadillac. Time, 57:43.

"AROUND THE CLOCK" ENDURANCE

First Contest of the Sort on Pacific Coast—
Nine of Eleven at Finish Have
Perfect Scores.

Nine drivers were awarded perfect scores on the result of the 24 hours endurance contest which commenced Saturday, May 30th, and was held under the auspices of the Automobile Dealers' Asociation of California over what is known as the San Leandro course. It was the first 24 hours event of its kind to be held on the western coast, and so far as is known, the first "around the clock" ever undertaken on the public highway by drivers of touring cars. There were 15 starters, of whom 11 finished.

The course, which scaled about 27½ miles to the lap, followed the sides of a rough triangle, with San Leandro as the starting and finishing point. The 12 laps were scheduled to be run on a time allowance of 2 hours each, but no restrictions were placed on the drivers as to running time, except for the 6th and 12th laps, which had to be completed within 3 minutes of the 12th and 24th hours. The times were checked for each lap, however.

Of the two cars completing the 570 miles, but failing of perfect scores, the Franklin, driven by Peter Callender, and carrying four passengers and an observer, was disqualified because its gasolene supply failed between controls. Notwithstanding, it finished on schedule time. In the case of L. C. Miller's Cadillac, a penalization of 36 points resulted from a broken commutator wire. Gus Boquet's Tourist and D. E. Whitman's Rambler were withdrawn on the first lap, while F. J. Wiseman's Reo and F. O. Renstrom's Pullman stopped on the 6th and 10th, respectively.

Beginning at two o'clock Saturday afternoon, the cars were despatched on five minutes headway. The first lap was covered by most of the cars at pretty high speed, in a hysterical effort to establish plenty of lead over the clock in order to forstall any emergancies. None of these, arising, howeve, the succeeding laps were for the most part covered with a fair degece of regularity and leisure. The Autocar driven by E. E. Bodge signalized itself by sticking closest to the 2 hour per lap schedule.

A most unusual circumstance in connection with an event of this general nature, was the fact that the officials were enabled to announce the final results on Sunday afternoon after only about a half hour's work. Those who finished with perfect scores, and the cars which they drove, were as follows: E. L. Peacock, Mitchell touring car; Frank Murray, Buick runabout; Max Rosenfeld, Peerless touring car; H. E. Anthony, Stoddard-Dayton roadster; R. G. Fowler, Pope-Hartford touring car; J. H. Eagal, Studebaker touring car; E. S. Mar-

tin, Mitchell runabout; Ray McDonald, Tourist touring car; and E. E. Bodge, Autocar runabout.

Indecisive Run-off at Kansas City.

Although 17 cars were tied in the 145 miles endurance run which the Automobile Club of Kansas City held on May 16th, there were only nine starters in the run-off which occurred on Saturday, 9th inst., for the purpose of breaking the tie. Of the nine starters, seven finished, but who won is a question which has not been decided. The day after the second run, the judges announced that it would be several days before a decision could be reached. While J. F. Moriarty, Stevens-Duryea, was the first to arrive back in Kansas City, H. Holtzhaurer, Pope-Hartford, made better time and claims the prize. The others who finished, and whose scores have not been announced, are H. E. Rooklidge, White; W. S. Hathaway, Maxwell; M. C. Nolan, Stevens-Duryea; C. J. Simons, Oldsmobile; W. M. Goodrich, Studebaker; Roy Sanborn, Stanley. Fletcher Cowherd, Corbin, did not

Nazzaro Claims New World's Record.

In England, where they do not appear to know as much about American records as they ought to know, Felice Nazzaro, the Italian driver, is credited with having on June 8th, made a world's record by covering a lap on the Brooklands track, near London, at the rate of 120 miles per hour. But in 1906, Demogeot, on the Ormond (Fla.) beach, covered two miles straightaway in 581/5 seconds, or at the rate of 122.4 miles per hour, and as Marriott flashed the mile in 281/5 seconds or 124 miles per hour, Nazzaro's performance is not so wonderful as may appear, although it was, of course, made on a concrete track requiring a circuit. The Brooklands track, 211-16 miles per lap, is in many respects practically two parallel straightaway courses, connected by scientific curves.

Status of New Jersey Licenses.

To settle a moot question, New Jersey's Attorney General has rendered an opinion on the validity of automobile licenses issued prior to April 16, 1908, the date the amended Frelinghuysen law went into effect. The Attorney General holds that licenses issued in the period from January 1, 1908, to April 16, 1908, are good for a full year, but is of the opinion that there shall be no pro rata license fees for the fraction of a year remaining between the expiration of a license taken out in 1907 and December 31 of this year.

New England Tour for A. C. A. Members.

The Automobile Club of America will conduct a members' tour, June 18-28, from New York through the Naugatuck Valley. Berkshire Hills, and the White Mountains to Poland Springs, Maine, and return. It will be in charge of Waldron Williams.

MANY VICTORS ON VALLAMONT

Ward, Matheson, Makes Best Time at Williamsport Hill Climb—Accidents at the "Hairpin" Curve.

Vallamont Hill, a terrestrial protuberance near Williamsport, Pa., was peopled by a crowd estimated at 10,000 on Saturday afternoon, 6th inst., when the second annual hill climb of the Williamsport Automobile Club was held. The crowd was rewarded by seeing Charles W. Ward in the Big Six Matheson better his record of last year by going up the mile incline in 1:403/5. His time last year was 1:59. They had also the sensation of seeing the same driver go over a steep embankment through the loss of a tire at a sharp curve known as the "Hairpin." This was in the 13th event on the program. Ward fortunately escaped injury.

In the free-for-all for stripped and racing cars, Ward won the club cup by making the hill in 1:513%. In this race A. A. Jones, of Philadelphia, driving a Ford car. lost control after taking the "Hairpin" curve successfully and his car skidded from one side of the narrow roadway to the other, finally throwing the driver out, running over him and then plunging down the bank into the woods. Jones, when picked up, was found to have several ribs broken, an elbow badly injured, while he was cut and bruised all over. The summary:

Event No. 1, for Ford cars exclusively—Won by Claude Kaufman; A. A. Jones, second. Time, 2:131/5.

Event No. 2, for electric cars—Won by F. G. Pecks, Babcock; Henry Noll, Pope-Waverly, second. Time, 3:12.

Event No. 3—Won by E. H. Zimmerman, Jackson; Longstreth, Maxwell, second. Time, 1:55.

Event No. 4—Won by A. A. Maitland, Buick; J. A. Gable, Buick, second. Time, 2:36%.

Event No. 5—Won by C. W. Ward, Matheson. Time, 1:403/5.

Event No. 6, for Franklin owners exclusively—Time, 2:143/5.

Event No. 7—Won by C. P. Brockway. Overland; C. B. Kaufman, Ford, second; E. H. Zimmerman, third. Time, 1:57.

Event No. 8—Won by C. P. Brockway, Overland; F. P. Brand, Imperial, second; J. H. Link, Maxwell, third. Time, 1:55%.

Event No. 9—Won by John A. Gable, Rambler. Time, 2:171/5.

Event No. 10, for motorcycles—Won by Gable, Indian; Archie Wemple, Reliance. second. Time, 2:1336.

Event No. 11, for Maxwell cars exclusively—Time, 2:00.

Event No. 12—Won by Stevens-Duryea. Time, 2:024.

Event No. 13—Won by Imperial. Time, 1:5834.

ANOTHER NEW ROADSTER MODEL

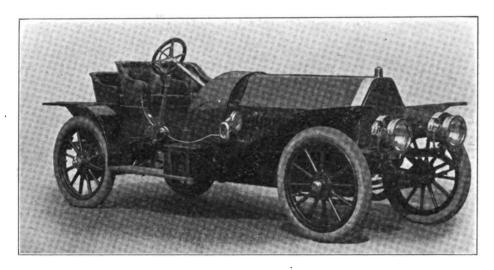

Flexibility of Purpose Shown in Body Design of Jewel 40—Mechanical Specifications of the Car.

Roadster models continue to multiply on the market with a rapidity and constancy which speaks volumes for the faith of the makers in the permanency of the demand for these handy and serviceable vehicles. The most recent development of that sort is the "Jewel 40," which the Forest City Motor Car Co., Massillon, O., has produced by way of rounding out its line. As the accompanying picture shows, it possesses the shaft mounting which also is applied to the steering gear.

The frame is of pressed steel; the spring suspension is semi-elliptic in front and platform in the rear double, internal-external brakes are applied to the rear wheels; and the wheel and tire sizes are 36 by 4 inches. The wheel base is 120 inches, and the total weight is listed at 2,400 pounds. The equipment included is complete down to a full set of lamps, including the headlight and generator installation.

Method to Lessen Headlight Glare.

Among the possibilities in connection with the very desirable dimming of searchlights when running through traffic, one which has not been exploited, so far as is

JEWEL 40 ROADSTER

usual roadster runabout characteristics as far as the placing of the motor, the two principal seats and the mechanism of control are concerned. The rear seat, which accommodates one passenger, is removable, as a matter of course, so that the vehicle may be used without it, or with a double-passenger seat replacing it, thus establishing that flexibility of purpose for which the runabout type of body is most admired.

The mechanical specifications of the car are closely allied to those of "Model G," the touring car made by the same concern. The motor is the four-cylinder Rutenber type, with cylinders of 43/4 by 5 inches bore and stroke, self-contained lubricating system in the crank case, and a six-feed mechanical oiler in addition. Ignition is of the duplicate pattern, with Bosch high-tension magneto and alternative of accumulator cells and coil. The transmission group is composed of a three-speed sliding gearset actuated through a cone clutch fitted with cork inserts, propeller shaft and full floating rear axie. The minimum gear reduction is 21/2 to 1, and the change gear affords three variations of forward drive. The bearings of the transmission, as well as those of the front and rear wheels are of the Tinken roller design—a method of known, is that of shifting the flame out of focus for the time being, or, what amounts to the same thing, shifting the lense or reflector. In lamps which are provided with lenses in front of the flame, the tilting of the lense through a small angle would distort the rays sufficiently to check the projection of the long distance beam, while in lamps not embodying a lense in front, a tilting of the central portion of the reflector might be made to accomplish the same thing. Such an arrangement would entail an alteration in the structure of the lamp.

World's Production of Copper Declines.

Last year for the first time in 15 years the world's production of copper showed a decline, according to statistics issued by a German metal company. The 1907 output. states this authority, was 713,000 tons. Of this amount, the United States contributed no less than 421,400 tons, England following with 72,400 tons, Central and South America with 57,000, and Germany with 31,900 tons. As in the matter of production, the United States led in the estimated consumption with a total of 232,600 tons. Germany, England and France, followed with 149,800, 108,200 and 65,000 tons, respectively.

EXPENSES SWAMP HUGE INCOME

Despite 5,000,000 More Passengers Berlin
Omnibus Company Loses Money—
Upkeep Half Original Cost.

During the year 1907, the General Omnibus Co., of Berlin, the largest undertaking of its kind in Germany, carried no less than 133,800,000 passengers. This represents an an increase of 5,000,000 passengers over the number carried in 1906, or a growth in paying business of 41/2 per cent. To add further to the apparent prosperity of the enterprise, an advance in the total traffic receipts of 10 per cent. was experienced. Notwithstanding this grand showing, however, the year's balance reveals a loss of about \$130,000, after allowing for depreciation. In the director's report this fact is attributed to a growth in general expenses, to which is added a deplorable item for maintenance and improvement of the rolling stock, which, it is said, amounted to nearly 50 per cent. of the original purchase price of the machines. The fact that the company is restricted in the matter of its takings since the rates of fare are subject to the sanction of the police authorities, probably has a good deal to do with the unfortunate trend of the returns.

Little Things with a Reason.

In overhauling a machine, it is extremely difficult not infrequently to "see the reason" for a number of little arrangements of the parts—devices which probably have cost the designer much thought, have been suggested by previous unpleasant experiences, and have been installed by the maker at some slight expense, as preventive and therefore necessary measures. On this account, the owner would do well to beware of stray bits of metal left over after a general clean-up of the power plant.

A case in point is the use of screens and wicking over the bearings in the gear case. Apparently there is no need for them; they tend to impede the flow of oil; they might at some time get adrift in the case and grind up between the gears; they are generally useless, says the amateur mechanic. As a matter of fact, however, they are placed there to strain from the oil as it is thrown over, any stray particles of metal. chipped from the gears, which might score the bearings. A similarly important purpose is served by the check valves which are sometimes placed at the delivery points of the oil feeds to the motor, by the grease cups which are stuck on in places where there is apparently no motion to require the alleviating influence of the lubricant, and by any one of a dozen other little details.

"The A B C of Electricity." Price 50... The Motor World Co., 154 Nassau Street, New York City.

ECONOMY IN CITY REPAIR WORK

Saving Effected by Operating Municipal Plants—What the Street Cleaning Department Has Accomplished.

With the number of automobiles used by the various departments of the municipal government constantly increasing, the city of New York has given considerable thought to the erection of a municipal garage. Though nothing decisive in this matter has been determined, some of the individual departments have taken up the subject of automobile repairing with the idea of cutting down the maintenance cost, a large part of which expense is incurred by having repairs done in regular garage and automobile repair shops.

While some of the city departments are not supplied with stables or buildings in which automobiles may be stored, others have not alone stables, but machine shops as well, and where plants of this kind are maintained in connection with the regular equipment of a department, the upkeep expense of that department's motor cars has very considerably decreased.

One of the departments which has seen the advantages of doing its own repair work is the department of street cleaning. While this branch of the city government long has maintained an elaborate shop equipment for use in repairing the large number of carts and other vehicles which the work requires, the development of an automobile repair shop has been of comparatively recent origin.

It was about three years ago that the use of automobiles in connection with city departments first began. Since that time the number of city owned motor cars greatly has increased until at this date there are about 100 belonging to the city, and of this number the street cleaners have ten. While the official garage of the department is located in an abandoned fire engine house in Mulberry street, the development of the repair shop has been in a building largely devoted to repair work of another nature, i. e., the up-keep of trucks, sprinkling carts and other similar vehicles. In this building, which is located on Seventeenth street and Avenue C, the equipment has been for blacksmiths, wood workers, harness makers and men whose work was in connection with the large fleet of scows and dumpers which the department maintained. As the building contained a power plant, it required but the installation of proper machinery, and the hiring of men to operate it, to establish an automobile repair department. About two years ago there was installed an engine lathe, milling machine, shaper, drill press, and emery wheel. A room of sufficient size to contain several cars was set apart on the mezzanine floor, and an elevator to carry the cars was put in.

A division of this room was made and the machinery installed in the division, which is just large enough to contain the tools and the one car on which the men may be working.

As the civil service laws do not control the appointment of "automobile engineman,"-the official title of the city's chauffeurs-it was possible to appoint any men whom the head of the department wanted for this position; it therefore was comparatively easy for the commissioner to engage the machinist to look after the repairs. A man was appointed, without thought as to his ability as an automobile driver, and another man with the same title and pay-\$1,200 per year—was appointed and directed to act as a helper. These two constituted the regular shop employes, and this force was agumented from time to time by the addition of the chauffeur whose car was undergoing repairs.

When it is considered that the work which is required of the department of street cleaning's motor cars it readily will be seen that the wear and tear on cars whose use is confined almost entirely to city streets, will be very severe. The very nature of the service requires that all kinds and conditions of pavements should be encountered, and as city chauffeurs take advantage of the fact of being municipal employes, the speed laws usually are ignored with the result that the cars are given severe treatment, if not actual abuse.

Because of the demands made on the cars the repair shop always is busy. At least one car is being worked on, and often another, or may be two more, are in the outer room waiting repairs. As soon as a car goes into the shop, whether the shop hands can start at it right away or whether it must wait its "turn," the driver of it at once does the preliminary work of dismantling and cleaning, so that no time will be lost when the actual repair work may be begun. If the repairs are of such a nature as not to require machine work, a broken spring, for instance, or a new spoke in a wheel, the work can be done by the department's regular mechanical branch, irrespective of the automobile repair shop, in which case the chauffeur shows what is needed, and when the new spring or repaired wheel is returned, he reassembles his car and goes out upon his round of duty.

Obviously, an important factor to be considered in the question of the economy of the work, is the efficiency of the repairman. In this respect the street cleaning department is fortunate in having as its master mechanic a man who is entirely competent. To him must a car be taken before the chauffeur can "lay it up." Usually the master mechanic takes an "inspection ride" in a car which is declared out of order, and as a result of the practical demonstration, the amount and nature of the repairs which are to be made is determined on. While some of the men who were employed as shop hands showed incompetency.

they easily were gotten rid of, as, not being civil service appointes, they could not claim civil service protection. The department thus was able to appoint and dismiss its automobile men until finally it obtained those who were conscientious and capable, and because of the efficient force which now is employed the repair shop serves as a means of economy instead of a source of unwarranted expense.

The system as worked out in the street cleaning department has distinct advantages. It reduces the cost of repairs, and it is the means of saving much time. The department is sufficient unto itself, and through its regular mechanical force and automobile repair shop, it can, if necessary, build an entire car and all its parts and accessories, excepting the tires.

That the repair shop is economical is shown by figures recently obtained from the comptroller's books for the year 1907. During this year the street cleaners spent \$2,739 for repairs, while the police department, with fewer cars, paid over \$3,500 to outside shops. While it is not possible to know the mileage of the cars of either department, it is almost certain that the distance traveled by the street cleaning automobiles vastly exceeded that of the other department.

While the municipal automobile repair shop largely was in the nature of an experiment, its two years of existence has justified its continuance, and the results which have been obtained will undoubtedly hasten the ultimate decision of having all the city owned automobiles repaired in a shop or shops owned and paid for by the municipality.

"Long-Arm" Axles of New Type.

Among the useful products of the "Long-Arm" System Co., Cleveland, O., which are being prepared for the builders of 1969 cars, are the new type "B" axle sets, which are designed for cars of 30 to 45 horsepower with maximum loaded weights up to 4,000 pounds. These are in the main similar to the sets produced hitherto and used on several American cars of this year's production, but differ from them in point of minor detail. The front member of the set is of the popular I-beam pattern, equipped with inverted Elliott steering knuckles, and integrally forged spring pads. By the ingenious device of forging these pads of very large size, and subsequently milling them down to specification, it is possible to employ a wide range of spring width and center-to-center distance, and thereby increasing the utility of the model greatly. Two types of rear axle are built, one of the ful! floating type, with bevel differential gears and cast steel housings, and the other of the semi-floating type, with large Hyatt roller bearings for the outer support, but otherwise similar to the full-floating axle The other bearings, like those of the standard set have either cone or annular races. fitted with special alloy balls.

BRAND NEW IDEA IN A CLUTCH'S

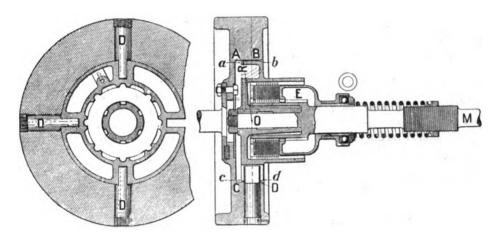

Novel Combination of the Multiple Disc with a Cardan Mounting—The Advantages of Each Retained.

Absolute flexibility in the connections between the essential elements of the power plant requires the use of a considerable number of universal or cardan joints in the mechanism of the well-designed car. In the case of the connection between the master clutch and the gearset, or between the motor and the clutch, this requirement frequently involves some little mechanical complication which might be avoided profitably were it possible to dispense with the

the spherical exterior of the clutch body, while the driving relation will remain undisturbed.

In order to transmit the driving torque from one element of the clutch to the other, four driving pins or tenons are employed, as at D-D-D, which are seated in as many holes placed at right angles to one another in the body of the fly wheel, and are fitted in guide slots, c-d, in the exterior of the clutch body. A veritable universal joint is thus formed. Within the casing so mounted the usual floating and stationary discs of the clutch are placed.

The clutch shaft is connected to the driving shaft of the transmision by means of a threaded sleeve, which is retained in place by a spring locking pin. By backing this off a few turns and releasing the eight bolts

provision for universal movement or were it possible to condense the clutch and universal joint into a single organ. This latter improvement over the ordinary arrangement is embodied in at least one clutch of the plain cone type, and of American manufacture. An entirely novel application of the same principle is, however, found for the first time. so far as is known, in the Cottin & Desgouttes clutch, which has lately been introduced into the French chassis of that name.

It is, so to speak, a combination of the multiple disc clutch with a cardan mounting, the result being the retention of all the advantages of the former with the extreme flexibility and freedom from cramping tendencies of the latter. This provision is, of course, especially desirable in a clutch in which, with the small clearance of the type, the slightest tendency to disalignment may cause binding with consequent inability to disengage completely.

From the accompanying illustration the general arrangement of the device will be seen. Made solid with the fly wheel is a cylindrical recess concentric with the axis O-M of the clutch, and having the radius O-R. Within is mounted the spherical clutch body, a-b, of the same diameter as the cylinder and compelled to turn with it. Obviously, any alteration of the alignment between the two will be accommodated by

which retain the flange coupling of the crank shaft on the face of the fly wheel the entire shaft and clutch may be withdrawn as a unit. The complete operation of dismounting the clutch and remove it from the chassis may be performed in less than two minutes, it is claimed.

To Prevent Trouble from Drippings.

There can be no question of the necessity of providing thorough and effective means of draining the under pans of all chassis in order to prevent the accumulation of inflammable vapors and their liquids. But in addition to this care should be taken to have the exhaust piping so arranged that in the event of a leaky gasket or a broken muffler casing there will be no danger of a discharge of sparks into the enclosure beneath the mechanism. In this connection care should be taken to see that the muffler cutout is not so placed as to permit any discharge under the car body. As for the carburetter, in order to prevent trouble from drippings of fuel, it is well to provide either for drainage entirely external to the pan, or else into a separate compartment independently drained. The oldfashioned canvas under-boot is never to be encouraged. It is but a make-shift at best, but when oil-soaked, it becomes a positive menace to safety.

MAY REVOLUTIONIZE INSULATING

German Substitute for Celluloid that Displays Remarkable Qualities and Appears of Far Reaching Promise.

Great commercial possibilities are thought to be held forth by a new substance, known as Cellit, which is announced as an incombustible material closely related in its properties to celluloid, but differing from it in that one material respect. It is a recent German invention, the origin of which is credited to a Dr. A. Eichengrun. If present hopes in it are realized, it may come to supplant the celluloid of commerce in nearly all of its practical applications, and also to have a much wider range of application, as in replacing rubber for the insulation of electric wires, as a transparent varnish for coating leather and woven fabrics, and in numerous other uses.

Although many attempts have been made to produce such a substance, none have been successful up to this time. A discovery of some ten years ago, for instance, acetyl-cellulose, as it was called, proved to be too soft to be useful. A later discovery, tri-acetyl-cellulose, which was made directly from cotton-wool, could not be employed, because it proved to be soluble only in chloroform, which is so injurious to the human system when handled extensively as to preclude the application of that particular compound in any practical way. The new acetyl-cellulose, however, differs from its predecessors in several respects, and among them in its property of solubility in camphor, acetic ether and other harmless solvents.

In a recent demonstration before the Dusseldorf Scientific Society, the inventor exhibited a wide variety of samples of cellit products. All such variations are perfectly transparent, unaffected by water, and not brittle. Some varieties cannot be ignited at all, while others burn but slowly. Some were hard, like celluloid, others soft like leather, and still others elastic like rubber. Samples were exhibited of papers and fabrics coated with the new substance employed as a sort of waterproof enamel, others of imitation "patent leather," and oil cloth in which the pattern was woven in the fabric, but transparent through the cellit coating. Most remarkable of all, however. was the successful use of cellit in insulating electric wires.

Speaking of the discovery, the Scientific American remarks: "In cellit, therefore, we have a new material which combines the good qualities of glass, gelatine, celluloid, leather and India rubber, and which may advantageously be substituted for these materials for many purposes. But cellit will also find entirely novel and peculiar fields of usefulness, as it at once is as transparent as glass and as flexible as cloth."

None Perfect in Washington Run.

With excellent roads and perfect weather conditions, 13 of 16 starters finished the endurance contest promoted by a Washington (D. C.) newspaper on Tuesday, 9th inst. The distance was 164 miles, and the course took the contestants through the States of Maryland, Virginia and West Virginia. While no perfect scores were made, two drivers, Luttrell (Buick), and Miller (Ford), were tied with only 2 points penalization each, in the light roadster class; strangely enough each of the two drivers was penalized for the same cause-stalled motors. In the roadster class Shaab (Stearns), also lost but 2 points, but because of his muffler becoming loose, the car had no running troubles and the defect was found only when the examintion took place in the garage after the run had been completed. H. Gill (Thomas-Detroit), went through with what he thought was a perfect score, but lost 15 points when it was found that a front axle was bent.

With the exception of the cars mentioned all had to break seals and do little odd jobs or one sort or another. Thomas (Pullman), lost 42 points through the necessity of tampering with his ignition system, and Zell (Thomas), was bothered by his left chain slipping off. Bliven (Franklin), had hard luck in breaking a steering knuckle, but came in with a man on the running board guiding the car. Jose (Cadillac) had to

break a seal because his gasolene pipe got stopped up; he was penalized, too, for taking on water and for a brake that worked loose. Shuler (Mitchell) was fined 80 points for being late at controls, 56 points for road repairs and 52 points for a bad brake. Lutz (Oldsmobile), suffered principally because of punctures—he had 9—his brake cost 35 points, and at inspection he lost 3 more. Jacobi (Columbia), ripped out all his lower gears, but arrived finally by driving on high. Padgett (Maxwell) lost points because of his brake, which became loose and did not work well. Lost time was responsible for most of Matson's (Corbin) penalization. The score:

Light roadsters—Luttrell, Buick, penalization, 2 points; Miller, Ford, 2; Padgett, Maxwell, 51.

Roadsters—Shaab, Stearns, 2; Matson, Corbin, 40: Thomas, Pullman, 42; Zell, Thomas, 117.

Touring cars—Gill, Thomas, 15; Jose, Cadillac, 141; Bliven, Franklin, 188; Shuler, Mitchell, 188; Lutz (pilot), Oldsmobile. 338; Jacobi, Columbia, 1,058.

Card for Second Point Breeze Meet.

Eight events constitute the program for the second annual race meet of the Quaker City Motor Club, to be held at Point Breeze track on Saturday, June 13. The distances range from one mile to 50 miles, the long distance race being a fre-for-all.

From Broncho Busting to Motor Racing.

From broncho busting to automobile racing will be the range of entertainment with which Douglas City, Arizona, will regale itself on the Fourth of July. The last named feature will be a novelty there, and it is planned to make it a successful one. It will consist of a 40 miles road race, and the course will include some of the streets in the city as well as roads in the immediate vicinity.

Elks to Hold Automobile Meet.

Automobile races will constitute one of the big features in a festival which the Washington Lodge of Elks, No. 15, of Washington, D. C., will hold at the Bennings race course, June 16, 17 and 18. The meet will be under the sanction of the A. A. A., and is scheduled for the afternoon of the 18th. There are five events on the card, one being for cars to be driven only by Elks.

Beach Racing for Cape May's "Fourth."

The motor car is to dominate the day in the Fourth of July celebration at Cape May. N. J., this year, although Wheelock's Indian band of 40 pieces, composed entirely of American Aborigines, will assist in the holiday making. Races will be held on the beach front boulevard, and on the strand, under the auspices of the Quaker City Automobile Club of Philadelphia.

The Man Ahead

knows by the sound of a Gabriel Exhaust Horn that a high grade car is coming. They clear the road and give "class" to the car.

Easily attached, always ready, nothing to wear out, worth more than the price in satisfaction.

The Gabriel Cut-Out Valve relieves back pressure of engine and assists in speeding, hill climbing and on heavy roads.

Write for prices.

HOW LUBRICANTS ARE TESTED

Simple Apparatus for Determining Their Quality—One Test the Owner can Make for Himself.

Probably the average motorist is more interested in knowing how well a certain brand of lubricating oil is likely to work in his motor than he is in learning its chemical composition or what steps are involved in its manufacture. Indeed, the chemistry of lubricants is commonly considered to be so extremely technical and involved in every respect that it is somewhat surprising to learn that the processes

applied in oil testing are, as a rule, comparatively simple and easy to understand. Furthermore, a casual summary of these methods of test reveals something of the amount of care which must be observed in the production of an oil possessing just those qualities which are required for it.

Without enumerating in detail the "specifications" which are required in a perfectly suitable gas engine oil, it is sufficient to indicate that four different properties must be taken into account, though these may be divided into a greater number when more intimately examined. For general purposes, however, those qualities which are of the greatest significance in an oil for use in the internal combustion motor are: the body, or practically speaking, the resistance which it offers to being squeezed out from between the bearing and its journal; its density or specific gravity; its resistance to the effect of heat in thinning, or changing its body, gumming, vaporizing and carbonizing, and the temperatures at which these effects may be supposed to take place; and its corrosive action on metal with which it may be in contact.

The technical equivalent for the quality

noted as body, is viscosity. What is known as viscosity of an oil is merely an arbitrary statement of its degree of fluidity. Actually, it is the number of seconds required for a known quantity of the oil to flow through an orifice of a certain diameter, when the oil is maintained at a stated temperature. Because viscosity varies at different temperatures; and because some oils thin out more rapidly than others when subjected to heat, viscosity alone cannot be taken as the true measure of value in the lubricant. In conjunction with other tests, however, it is considered of great importance.

A standard type of viscosimeter is shown in Fig. 1, which is of extremely simple pattern. The outer container, A, serves as a water bath, in which is mounted a cylindrical tube or pipette, B, the lower end of which is closed by a cork, C, while the upper portion is passed through the base of a small overflow font, E. Beneath the device is a flask or graduate glass of known capacity, into which the oil is allowed to flow. Means for supplying water of any required temperature, and a couple of thermometers, complete the apparatus.

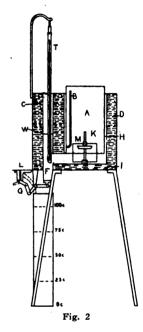

When making a test, oil is put into the pipette until it overflows into the font at the top. Warm water is then supplied to the bath by means of the tap above, while the bottom tap is opened sufficiently to regulate the water level properly and yet provide a constant circulation. The temperature of the bath is brought up to 70 degrees Fahr., as noted by the thermometer, F, and is held there until thermometer, C, also registers 70 degrees, indicating that both oil and water are at exactly the same temperature. At this point a syringe is inserted in the overflow font. E. and sufficient oil removed to bring the level down to the top of the overflow in the pipette. This ensures the presence of an exact quantity of oil in the pipette at that temperature, and the withdrawal of a certain amount when the proper temperature is reached, is made necessary by a very slight increase in volume of the oil while heating.

When all is ready, the operator grasps a stop watch in one hand, and with the other removes the stopper, C. The oil is permitted to run down into the flask at the bottom until the level in the pipette comes to a mark near the bottom, when the stopper is quickly replaced and the time taken at the same instant. In the ordinary form of viscosimeter, 60 cubic centimeters are permitted to flow in this way, leaving 8 of the original 68 cubic centimeters in the glass. It is necessary to leave a small amount of oil in the pipette in order to prevent the flow from being retarded by sticking to the sides, this effect being different with oils of different bodies. The number of seconds required for the 60 cubic centimeters to flow under the conditions named, is called the viscosity of the oil.

As the rate of flow through the lower orifice must vary with the amount of oil in the pipette, a somewhat more complicated

apparatus is sometimes employed for making very accurate determinations. This is shown in Fig. 2, and is so constructed that during the entire time the specified quantity of oil is flowing a constant level or "head" is maintained over the orifice.

The principle and method of operation in this case is the same as in the first type mentioned. A is the font or oil well, in which the main supply is placed, and which is in the form of an inverted cup or container, closed at the bottom with a valve, K, supported by the frame, M, so that no oil is permitted to flow from it as it is placed in the apparatus in the position shown. As soon as it is in place, however, oil flows out through the opening of the valve, K, by

the pressure of the bottom of the chamber in which the cup rests on the valve stem. Four little tubes, one of which is shown at B, are so arranged in the cup as to permit air to enter until a certain stated level is reached. At that point the rising level in the chamber in which the cup is contained, forms a seal which cuts off the air supply to the tubes, thus preventing any more oil from flowing until the level in the chamber is withdrawn.

The jacket D-C, is arranged much as in the first instance, and is designed to keep the oil at the required temperature. The thermometer, T, is suspended in the well, W, where the bulb is immersed in the oil. The stopper, F, is in the form of a valve, held by a couple of links and the spring catch, L, in such a way that upon releasing the latter the valve drops entirely out of the way, permitting the oil to flow into the receiving glass below. When the desired amount has run out the handle G is raised, shutting the valve.

Closely allied to the viscosity is the density of the oil, which is obtained by the use of a hydrometer similar to those sometimes employed in testing the specific gravity of gasolene. The readings of specific

gravity and viscosity are the most significant tests made upon the oil. Together, they closely define its properties to the oil expert.

The effects of heat are obtained by several tests which give the "flash point" or temperature at which the oil vapor will be ignited by an open flame held a half inch above its surface; the fire test, denoting the temperature at which the oil itself takes fire; and the tendency to gum, by a test in which several streams of oils of different sorts are permitted to flow over an inclined plate heated to a stated temperature. The difference in time taken by the various samples when started at the same instant, measures the thickening or drying effect of the heat, coupled with the effect of the air.

The effect of the oil upon metal by corroding it is shown in various ways, but perhaps most effectually by a test which is within the reach of any one who has the curiosity to try it. It is merely necessary to wrap a few coarse threads taken from cotton waste, about a piece of brightly polished steel, saturating the cotton thoroughly with the oil to be tested, and then to place the sample in the sunlight in a fairly warm place. If the oil contains acids, it will tend to etch into the steel. In bad cases the effect will be noticeable within a few hours. Suitable oil or grease will show not the slightest dulling effect on the polish even after several weeks or even months of such exposure.

This test is quite an important one, because an oil containing acids will soon roughen the journals it is intended to lubricate, and will have an even worse effect upon the cylinder, under the action of the high heat. On this account it is well for the owner who is about to try a new and unknown brand of oil to make this test for himself, since it is costless, and requires no time or special apparatus. If no etching effect is shown, he may be sure that the oil is not injurious to the bearings, however well or ill it may behave in the cylinder, in respect to its lubricating and carbonizing properties. If it dulls the surface on which it is tried, within a reasonable length of time, it is not suitable for any purpose, regardless of its appearance in other respects.

When Lubrication by Hand is Advisable.

When overhauling the machine, there is danger of omitting to oil bearings which have just been cleaned with gasolene or kerosene. Because it requires an appreciable length of time for the oil to reach all bearings through the regular channels from the lubricator, there is more than a bare chance that a tightly adjusted bearing may suffer considerably when the machine is first started. On this account, as well as owing to the fact that there also is some liability on the part of the repairman to forget to adjust the oiler after an overhauling, it is very important that all bearings be oiled by hand during the process of assemblage.

NEW PROCESS FOR RUST-PROOFING

"Cosletting" a Method of Effecting Chemical Change in the Metal's Surface—
Applicable to Many Uses.

Although numerous processes have been invented for rust-proofing metal, all those which have been put to the practical test possess certain drawbacks, either in the shape of unsuccessful results under certain circumstances, or else in the way of prohibitive cost from the standpoint of general all round utility. These methods range from the use of mere paints of various sorts to systems of coating with non-corrosive metals. A recently developed English process however, differs from either of these classes, in that it effects a chemical change in the surface of the metal itself, much as the outer layer is affected by the case-hardening process. It is known as the Coslettising process, and is the invention of T. W. Coslett, of Birmingham.

A lecturer before the Bírmingham University Metallurgical Society recently described the process as consisting "in immersing the article in a hot phosphorized solution together with an iron compound. The surface of the iron is converted into a mixture of ferrous and ferric phosphates, and presents a pleasing dull-black appearance. This process makes the iron highly resistant to corrosion, and is being applied to all kinds of light engineering work, such as cycle frames, gun-barrels, stampings, and press work."

"The invention is of both scientific and commercial importance, since it establishes the fact that under certain conditions iron will absorb phosphorus just as it absorbs carbon in the cementation process," comments the Autocar in reference to it. "The phosprorus, however, does not enter into the structure of the metal, but only penetrates the surface to a fractional degree, yet sufficiently to render it immune from rusting influence. The inventor has clearly established this fact by the action of the process upon steel springs of the most delicate description, which when treated retain their resilient and other essential properties. That it is not a mere coating is proved by the effect of the process upon the threads of fine screws, which run just as freely after treatment as before. The accuracy even of the micrometer gauge is not impaired in any way by the Coslettising process. These and other similar experiments will substantiate Mr. Coslett's claim that phosphorus, which under other conditions has so deleterious an effect on the stability of iron and steel, yet is absolutely harmless when incorporated under proper control.

"The articles intended for treatment are immersed in a chemical bath for three or four hours, which is maintained at boiling point. They are then withdrawn and placed in a stove or other drying apparatus for a few minutes at a temperature of 212 degrees Fahr. They are then oiled, and the process is complete. The cost of the solution is less than a farthing (½ cent) per gallon, and the utensils employed are of the crudest description.

"It will be seen that the process is extremely simple to manipulate, all that is required being an enamelled iron or cast iron vat for containing the solution which is kept at boiling point by means of a Bunsen burner or other source of heat. When the solution is boiling the metals intended for treatment are immersed, and after a lapse of three of four hours are withdrawn, dried, and oiled. This completes the whole process."

Already one firm of English motor car makers is contemplating the adoption of the process under license from the patentee. It is planned to apply it to such exposed parts as are sometimes plated and sometimes merely polished, and also to panels and wings, which now are either leaded or tinned. This will prevent rusting and also, it is hoped, help to develop a higher finish. A project is even entertained of treating tire rims in this way to prevent them from rusting when more or less scarred from successive tire changes. The possibility of applying the system successfully in this connection remains to be demonstrated, however, as the upper limit of temperature which metal is processed will stand after treatment, has not been determined. According to one investigator it will stand a dull red heat and not lose The black tone disappears as the surface oil burns off, to be sure, but on being wiped over with oil again it burns black and sets black, he maintaines.

Special Spark Plug for the Magneto.

Because of the relatively great current strength of the energy delivered in the spark from a high tension magneto it has been found that improved running conditions may be obtained by the use of a special form of spark plug instead of the standard type commonly used with the battery and coil system. To fulfil the demand which is thus created a new "Soot-Proof" plug has been developed by C. A. Mezger, Inc., New York, which affords the required reinforcement in the matter of insulation and also has four sparking points, instead of the one employed in the regular "Soot-Proof" plug. These points are stamped from a single piece which is spun into the base of the shell of the plug, and are spaced 1-32 of an inch away from the central electrode. The insulator, which is of strong, hand turned porcelain, has a squared internal socket into which the rectagular shoulder of the electrode fits. As a result of this arrangement there is no danger of loosening the spindle when adjusting the terminal connection. The body of insulation is unusually large, and special provision is made for sealing all joints gas-tight.

BROADER SHARING OF ROAD MONEY

Jersey's Automobile Income to be More Generally Distributed—All Improved Roads to be Benefited.

An important and far reaching change in the distribution of revenue derived from the taxation of automobiles in New Jersey will result from the operation of the Frelinghuvsen law as amended at the last session of the legislature. State Road Commissioner Frederick Gilkyson has received from Attorney-General McCarter an opinion which holds that under the amendments the income derived from motor vehicles must be divided among the various municipalities of the State in proportion to the mileage of improved roads in each. In the past the revenues from this source have been apportioned only on the basis of roads in which the State shared the burden of construction.

The attorney-general holds that it was the evident intention of the last legislature to distribute the funds for the repair of all improved roads of a certain character, regardless of who paid the original cost.

"My construction of Section 37, of Chapter 304, of the laws of 1908," says the attorney-general, "is that the funds you receive from the State treasurer are to be appropriated by you for the repair of all improved roads of the character designated in the act, whether improved by the counties, towns, townships, boroughs, villages or other municipalities. The design of the act seems to have been to apply the funds to the repair of all improved roads, whether they have received State aid or not, and of course roads that have been improved by municipalities other than the counties are quite as apt to be used by motor vehicles and to need repairs as roads in the counties that have been improved by the counties themselves."

The amendment of 1908 will cause quite a shake-up in the distribution of the money turned into the State by automobilists. Heretofore the lion's share went to the counties which had invoked the greatest amount of State aid in building their roads. Burlington County, for example, received as its share nearly \$9,000, while Union and Hudson, whose roads were built without State aid, received lass than \$200 apiece.

According to the last report of the road commissioner, there are in the State 1,231 miles of roads built under the State aid law. Toward the construction of these the State has contributed \$2,283,007. Improved roads built in the counties without State aid aggregate 800 miles. In order to determine the amount to which each municipality will be entitled, it will be necessary to obtain reports from about 473 municipalities in the State showing the total milage of improved roads in each. It is estimated that the re-

ceipts this year from the motor Vehicle department will be about \$82,000, or nearly \$26,000 more than last year.

Under the new method of distribution Burlington, Mercer, Middlesex, Monmouth and other counties which have invoked the State aid law most freely will be the losers, while those counties which have built their own macadam roads will be the proportionate gainers. Improved roads under the motor vehicle act do not include streets paved with cobble stones, Belgium block or asphalt.

The distribution of the automobile fund in 1907 was as follows: Atlantic, \$3,896.43; Burlington, \$8,850.75; Camden, \$3,724.60; Cape May, \$1.158.66; Cumberland, \$62.96; Essex, \$4,598.27; Gloucester, \$3,864.70; Hudson, \$125.91; Mercer, \$5,987.02; Middlesex, \$6,015.14; Monmouth, \$4,345.89; Morris, \$3.122.15; Ocean, \$1,695.63; Passaic, \$2,540.71; Salem, \$1,146.95; Somerset, \$3,104.61; Sussex, \$341.50; Union, \$176.98; Warren, \$1,719.98.

Road Destruction by Two-Wheeled Carts.

Motorists who venture into Mexico and find the roads beyond power of description have discovered an offending cause in the ever present two wheeled cart. The wear which these vehicles bring upon the road is said to be far in excess of that occasioned by any other element of traffic. When one of the wheels strikes an obstacle, it pauses momentarily, while the other swings part way around it, incidentally scraping away a section of the road surface. A similar effect results with the first wheel as soon as the obstruction has been surmounted. In this way the heavy wagons leave a zig-zag trail of dismantled road behind them. In addition to this, the wear and tear on the draft animals occasioned by these side swayings, will, it is thought, ultimately lead to the suppression of these relics of antiquity. Until such time, however, it is thought that well preserved roads will remain an impossibility.

Salvage Corps to Have Motor Wagon.

After thoroughly studying the use of automobiles as applied to the service of salvage corps, the Underwriters Protective Association of Newark, N. J. have appropriated \$6,000 for the purchase of an automobile salvage corps wagon. Basing their calculations on the time made by the machines now in use in other cities, the Newark underwriters figure that a motor car can cover a certain distance in four minutes which takes eleven minutes to travel with the horse drawn vehicle.

Memorial for an Early Motor Builder.

A memorial tablet has been placed on the house in Malchin, Mecklenburg, Germany, in which Siegfried Marcus was born. To Marcus is given the credit of building the first gasolene motor car constructed in Europe. The car was built in 1875 and now is in the possession of the Austrian Automobile Club.

HITTING IT RIGHT BY CHANCE

One of Many Incidents Illustrating the Haphazard Methods of Some Drivers
—Sometimes They are Lucky.

It has been advised frequently that the use of non-skid shoes on opposite "corners" of the car tended to unsatisfactory and abnormal running conditions. This is because the difference in diameter of the nonskid and non-skidless wheels, causes the differential to work continually and also interferes with the steering more or less. The old theory that a car was less liable to skid when so equipped than when both nonskids were on the rear wheels is no longer advocated by well posted drivers. But nometimes there are other reasons for following the practice, as was evidenced by a conversation which recently was overheard.

A bystander inquired of the driver of a car which had just drawn up to the curb, why he carried steel shod tires on opposite sides, front and back; the driver replied that "it just happened so."

"But don't you think it keeps you from skidding that way?" continued his questioner.

"No, I don't know that it does."
"Then why——"

"Oh, it just happened there were 'sand holes' in those two tires, that's all. I never thought about the differential business, but it was easier putting the non-skid in front than changing over the front tire to the back and then putting it on, and I couldn't see that it made any great difference either way."

How Motorists Generally Obey the Law.

In view of the probable passage of a great many motor vehicles through Shrewsbury, Mass., on Saturday, 6th inst., the day of the hill climb at Dead Horse hill, the selectmen of the town placed two constables on the main road between Shrewsbury and Worcester to enforce the speed law. According to the report of one of these officers only a few of the 1,000 or more motor vehicles that passed him were traveling very fast, and he warned but one operator. One vehicle, however, bearing the number "C 201 M" traveled, as he estimated it, a quarter of a mile in 17 seconds.

Bermuda Excludes all Automobiles.

Bermuda has barred automobiles by legislative enactment which has received the approval of the governor of the province. The probability of such action being taken was stated in the Motor World early in the year when agitation against automobiles was begun by residents and visitors. The new law revokes the permission to run motor vehicles which had been granted by a previous law.

The Week's Patents.

883,552. Clutch Mechanism. Carlton R. Mabley and Gustave E. Franquist, New York, N. Y.; said Franquist assignor to Smith & Mabley, Incorporated, New York, N. Y., a Corporation of New York. Filed Jan. 9, 1904. Serial No. 188,327.

1. In an automobile, the combination of a driving gear and a shaft comprised in part by a clutch member, a sleeve supporting said clutch member, a hollow shaft on which said sleeve is adapted to slide longitudinally, a spring device contained within the said hollow shaft for moving the clutch member in one direction, the said hollow shaft being connected at each end to other sections of shafting and in alignment therewith, the said hollod shaft and its supported parts beinb removably secured by such connections in such manner that the said hollow shaft and its supported parts may be uncoupled and removed from the machine without disturbing the alignment of the remaining portions of the shaft.

833,554. Sparking Device. Henri Maillard, Paris, France. Original application filed Jan. 30, 1905, Serial No. 243,371. Divided and this application filed Oct. 24, 1906. Serial 340,422.

1. In an electromagnetic sparking device, a two part iron core one of said parts beinging in yielding engagement with the other, said movable part supporting a rod of non-oxidizable metal centrally reinforced with a rod of heat refractory metal, said second rod having a tip of non-oxidizable metal, a second terminal, and a support for the same out of metallic contact with said core.

883,572. Pneumatic Tire Shield. Frederic W. Savage, Granville, N. Y. Filed Nov. 10, 1905. Serial No. 286,731.

1. A removable shield for pneumatic tires, composed of interjoined links formed of round wire and sufficiently twisted to form a substantially unbroken and comparatively flat surface, adapted to cover the tire.

883,582. Device for Automatically Controlling Lamps on Vehicles. John W. P. Smithwick, La Grange, N. C. Filed March 22, 1907. Serial No. 363,792.

1. The combination with a vehicle frame, a front axle, stub spindles pivoted to the ends of the axle, wheels on the spindles, rearwardly extending arms on the spindles, a rod connecting the arms, and means for manually controlling the pivotal movement of the spindles, of brackets secured to the frame in front of the axle and each having an upright member provided with a vertical opening, bifurcated standards mounted to turn in the openings of the brackets, lamps pivoted on horizontal pivots between the members of the standards, downwardly curved arms rigidly secured to the lower ends of said standards, a rod connecting the arms of the standards, said rod comprising two sections pivoted at one end to the arms and having their other ends screw threaded ends of the rods, adjustable boxes, one on the said rod and the other on an arm of one of the spindles, and a rod extending diagonally across the axle and having its ends pivoted to the said boxes.

883,658. Friction Clutch. Henry Lutz, Denver, Colo. Filed Jan. 23, 1907. Serial No. 353,643.

1. The combination of a driving shaft, a clutch wheel mounted to rotate therewith and provided with open ended casings, plungers slidable in said casings and provided at their outer extremities with fric-

tion faces, a sleeve slidable on the shaft, the said levers having approximately the shape of bell cranks, one arm of each bell crank engaging the sleeve, while the other arm is provided with a weight, substantially as described.

883,710. Mud Wing for Motor Vehicles. George Frentzen, Aix-la-Chatpelle, Germany. Filed Jan. 16, 1906. Serial No. 296,-401

1. A mud wing for motor vehicles consisting of a rigid body substantially inclosing with its longitudinally curved part the rearward upper quadrant of a front-wheel of a motor vehicle, and transversely bent to terminate in an integral member for securing said mud wing to the vehicle body and to admit of said front wheel taking up any desirable angular positions within said body.

883,732. Friction Clutch. Van Zandt M. Moore, Cleveland, Ohio. Filed Jan. 15, 1906. Serial No. 296,017.

1. In a friction clutch, the combination of a pair of members having conical surfaces inclining in opposite directions, said members being rotatable together but movable toward and from each other, a spring tending to thrust said members into clutched position, a third member having two conical surfaces one of which encircles the other, rotatable together and adapted to be engaged by the respective members of the pair under the influence of the spring and mechanism for moving the members of the pair in opposition to the spring to release the third member.

883,735. Driving Mechanism for Motor Carriages. Alfred B. Morse, South Easton, Mass. Filed Sept. 26, 1903. Serial No. 174,782.

1. Driving mechanism for a motor vehicle, comprising an axle, a power transmitter mounted thereon, two gears carried by said axle for operating said transmitter, and balance levers pivoted on the plungers, and clutching mechanism including two actuating means, located at the opposite sides of said transmitter and connected together at the axle for coupling one or the other of said gears and said transmitter as desired and a single operating device for said two connected actuating means.

883,740. Spray Carburetter. Peter A. Poppe, Coventry, England. Filed Jan. 15, 1907. Serial No. 352,358.

1. In combination, a jet nozzle, means for maintaining the fuel at a suitable height therein, a mixing chamber having an inlet thereto and an outlet therefrom, a rotatable plug cock arranged in said chamber and adapted to control said inlet and said outlet, a jet nozzle controlling device connected thereto, and an adjustable cylinder arranged around said plug cock with holes in said cylinder corresponding with said inlet and to said outlet of the mixing chamber, substantially as set forth.

883,763. Tire for Vehicle Wheels. James E. Tourtellotte, Hartford, Conn. Filed May 28, 1906. Serial No. 318,997.

1. A tire composed of elastic material

"REMY MAGNETO"

and having sloping sides gradually tapering from the inner edge to a dimension of less width nearer the outer edge of the wheel, a reinforcing strip composed of practically unyielding material and having side parts conforming to and embracing the sides of said tire, the entire inner surface of said reinforcing strip being vulcanized to the tire, and means for securing said reinforcing strip to the rim of a wheel.

883,774. Power Transmission Device for Motor Vehicles. Frederick C. Avery, Harvey, Ill. Filed March 9, 1904. Serial No. 197,289.

1. In a power transmission device, a frictwo wheels in friction contact with said disc and rotating in opposite di-rections, two shafts driven by said wheels, a gear attached to each of said shafts, two driven shafts, two driven gears mounted thereon, two swinging hangers mounted concentric with the two first mentioned shafts, said hangers supporting the driven shafts, two swinging brackets, a single intermediate gear attached to one bracket, two intermediate gears attached to the other bracket, and said brackets arranged to swing in order to move the intermediate gears in and out of contact with the driven gears as herein shown and described.

Brake and Clutch Operating Mechanism for Automobiles. Charles Schmidt, Cleveland, Ohio, assignor to the Peerless Motor Car Company, Cleveland, Ohio, a Corporation of West Virginia, Filed March 29, 1906. Serial No. 308,759.

1. In an automobile, the combination of the two rear wheels having cylindrical braking surfaces and brakes, which engage with the braking surfaces on said rear wheels and are provided with operating levers, with an equalizing bar, supports secured to the automobile frame for sustaining said equalizing bar and permitting it to move forward and backward, links connecting the brake operating levrs with said equalizing bar, a draft device connected with said equalizing bar, and mechanism for operating said draft device.

Speed Changing Mechanism. 883,870. Walter O. Foss, Philadelphia, Pa., assignor to Direct Motor Drive Mfg. Co., Philadelphia, Pa. Filed Dec. 5, 1907. Serial No. 405,188.

1. In combination, a power shaft, a driving disc, a pinion, an annular member mounted upon and rotatable about the periphery of said driving disc and geared to said pinion, a clutch adapted to lock said annu-lar member to said driving disc, free gears mounted upon said power shaft and geared to said pinion, and a clutch mounted on and rotating with said power shaft and adapted to positively engage either of said free gears, substantially as described.

883,973. Lamp Bracket. Edwin M. Rosenbluth, Philadelphia, Pa. Filed June 21,

1906. Serial No. 322,666.

1. A lamp bracket comprising means arranged to detachably support a lamp; and means, comprising a rod, adjustable in the direction of its length toward and from said lamp, and arranged to detachably support a license panel, which is also adjustable with respect to said rod, said supporting means being so co-operatively connected that said panel is illuminated by said lamp, substantially as set forth.

883,981. Gas Generator for Explosive Engines. Henry K. Shanck, Cleveland, O., assignor to The Euclid Motor Company, Cleveland, O., a Corporation of South Dakota, Filed Jan. 23, 1906. Scrial No. 297,423.

1. The combination in a quick speed explosion engine, of means for vaporizing the explosive fluid and for commingling the same with air to a predetermined degree, comprising an elongated tubular commingling chamber, a nozzle for the fluid at one end thereof arranged to discharge the fluid longitudinally of the chamber, a needle valve having a shoulder in said nozzle, means for obtaining a minute adjustment of said valve, a lateral air inlet in said chamber adjacent to said nozzle, a valve in said air inlet, a governor operatively connected with a rotating part of the engine, and coordinating instrumentalities for operating the valves of the fluid nozzle and air inlet whereby an unvarying proportion of aid and fluid is obtained, said co-ordinating parts being operatively connected with and controlled by said governor, substantially as described.

884,053. Explosive Engine. Henry L. F. Trebert, Rochester, N. Y., assignor to Brownell-Trebert Company, Rochester. N. Y., a Corporation of New York. March 20, 1905. Serial No. 250,908.

1. In an explosive engine, the combina-tion with a cylinder having a head provided with two apertures, and gas inlet and exhaust pipes leading over the head at opposite sides thereof in proximity thereto, and communicating with the apertures therein, of valves controlling said pipes, stems thereon extending upwardly through the pipes and mechanism located between said pipes and co-operating with the valve stems.

884,117. Motor Vehicle. Alexander Winton, Cleveland, Ohio. Filed May 25, 1903. Serial No. 158,714. Renewed Oct. 1, 1907. Serial No. 395,369.

1. In a motor vehicle, the combination of a horizontally and transversely arranged engine frame, side sills longitudinally arranged and intermediately connected to opposite ends of the engine frame, a water cooler connecting and constituting a cross-beam or sill for the forward projecting ends of the side sills, and supporting driving and steering axles connected with the oppositely projecting ends of the said side sills

884,118. Lubricator. Alexander Winton, Cleveland, Ohio. Filed Nov. 12, 1904. Serial No. 232.489.

1. A lubricator including an oil chamber, a rotatable feed roll located therein, the oil chamber having an oil passage way extending thereinto, an oil gatherer adapted to gather the oil from the feed roll and de-liver it to the oil passage, means for feeding oil to and maintaining it at a level within the chamber below the gatherer and the inlet end of the passage way, and an adjustable oil remover located adjacent the surface of the roll and at a point in advance of the said gatherer in respect to the direction of rotation of the feed roll.

884,172. Variable Speed Gearing. man T. Lewis, Milwaukee, Wis., assignor of two-thirds to Retta Pierce Davenport and Everett C. Rockwell, Chicago, Ill. Filed April 13, 1907. Serial No. 367,911.

In transmission gearing, a driving member, rotatable independently thereof, an intermediate member, gear connections be-tween said driving and driven members, part of said gear connections being mounted on said intermediate member, a stationary member and a controlling member permanently connected to said intermediate member to thereby rotate therewith or prevent it from rotating, said controlling member being adapted to occupy a plurality of positions, in one position in engagement with said driven member to thereby cause

it and the driving member to rotate at equal speeds, and in another position in engagement with said stationary member to there-by arrest said intermediate member and cause the motion of the driving member to be transmitted to the driven member by way of said gear connection, in combination with means for shifting said controlling member to its different positions, said shifting means comprising a hand operated member having beveled surfaces co-oper-ating with beveled surfaces on said stationary member.

884.193. Vehicle Steering Mechanism. William McGlashan, Cleveland, Ohio, assignor to the Winton Motor Carriage Company, Cleveland, Ohio. Filed Nov. 12. 1904. Serial No. 232,455.

1. An improved vehicle steering mechanism, comprising a suporting casing, a rotatable steering post having a longitudinal bearing and also a transverse thrust-bearing in the casing, a longitudinally movable sleeve located within the casing and hav-ing internal screw threads, the steering post having external screw threads engaging the threads of the sleeve, means for preventing the rotation of the sleeve, and a connection between the sleeve and the steering wheels of the vehicle.

884,201. Fender and Brake Attachment for Automobiles. John O'Leary, Cohoes, N. Y., assignor of one-half to Edward Penrose. Cohoes, N. Y. Filed Dec. 24, 1907. Serial No. 407,881.

1. In an automobile, car or the like, the combination with the front axle. front wheels, and movable connections carried by the axle and to which the wheels are attached, of a fender secured to the said movable connections and having its rear portions located within the sides of the wheels.

884,294. Tire Sealing Device. George H. Phillips, Plymouth, Mass., assignor of onehalf to himself and one-half to George F. Soule, Plymouth, Mass. Filed Oct. 30, 1907. Serial No. 399.818.

A cealing device for pneumatic tires comprising a scaling member having a shoulder. adapted to fit against the wheel rim, and a comparatively thin edge, and means adapted to embrace the tihe and wheel rim for securing such sealing member in place.

12,777. Reissue. Vehicle Wheel Rim Frank A. Seiberling, Akron, Ohio. Filed March 3, 1908. Serial No. 419.056. Original No. 765,044, dated July 12, 1904. Serial No. 192,947.

A vehicle wheel rim of the class described, consisting of a base rim and a band capable of contraction on and a reversal of position around said rim, one of the sides of said band being formed into a hook shape and the other with an approximately vertical side and fashioned to engage, in alternation, the clencher and inextensible edge tires, substantially as and for the purpose described.

884,488. Running Gear for Harry W. Hancock, Chicago, III. Filed Sept. 23, 1904. Serial No. 225,628.

1. In a running gear for vehicles, in combination, a bed frame; and means for supporting said bed frame comprising a spring at each end of said bed frame said spring being attached at each of its ends to said bed frame, a wheel carrying arm pivottally connected intermediate its ends with each of said carrying springs and adapted to support an axle at one end, and means for yieldingly connecting the other end of each of said carrying arms with said bed frame.

Dealers can make quick sales with this machine. The upkeep is very light; has solid rubber tires; goes through deep mud and sand, and climbs steep hills. Double cylinder, air cooled, 10-12 H. P. It's your loss if you don't get the agency. Write,

Nuts That Require Tightening After considerable use the bolts driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, "07.

Use Columbia Lock Nuts
COLUMBIA NUT & BOLT CO., Inc., Bridgeport, Conn.

FRANKLIN Automobiles

How much power should an automobile have?

The Franklin 4-cylinder Type D automobile has 28 horse-power—7-horse-power to a cylinder; and that carries five people 45 miles an hour.

Many 4-cylinder automobiles—some of them carrying only five passengers—have 40 horse-power and upward. That is, every explosion gives a 50 per cent harder shock to the crank-shaft and the whole transmitting mechanism than you get in Type D.

Of course the whole machine has to be built bigger and heavier to stand this increased shock. The extra weight uses up a good deal of the extra power. What is left gives you a little more speed on fine smooth roads. But you can't go any farther in a day; because a heavy automobile is neither comfortable nor safe to run at speed on American roads.

So what do you get out of a bigger-powered 4-cylinder machine than Type D?

You can't use enough of the extra speed to give you more touring ability. And the extra weight makes you pay outrageously for gasoline and tires.

If you want a high-powered automobile the Franklin Type H gives you 42 horse-power properly balanced with six-cylinders. There's no shock at all. It carries seven passengers 55 miles an hour, and it only weighs 2,600 pounds. Think of that! Less than the average 5-passenger, 4-cylinder machine. And it costs less to own; yet no automobile of any power has more touring-ability than this Type H.

No jolting from the roads, either. The Franklin laminated wood frame and 4 full-elliptic springs absorb the road-jar. This makes easy-riding both for the passengers and the machine. With their light-weight and high-grade construction the Franklins are the longest lived of all automobiles. Depreciation-cost is low; running-cost is low. And you get the good of all the power all the time.

What's the sense of paying big up-keep charges for weight and power that you can't use?

Write for the catalogue describing Franklin models

Large Sales

make it possible for us to import THE CELEBRATED BRAMPTON CHAINS from ENGLAND (paying freight and duty), and sell them at the same price at which the several other automobile chains are sold to manufacturers, jobbers, dealers and users.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides on the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our best advertisement.

THE BRAMPTON CHAIN is made of helf-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material-self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMP-TON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size—as follows:

CHAINS TO FIT AMERICAN CARS

We also carry in stock the BRAMPTON CHAINS to fit Foreign Cars-Mercedes, Panhard, Martini, Fiat, etc.

Your 1908 Car

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

Agents wanted in unoccupied territory. Catalog on request.

We are Sole American Agents for BRAMPTON CHAINS, and they cannot be bought from anyone else except through our Agents.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varmished furniture or woodwork of any kind. It will remove stains, cover scratches; leaves the automobile with its original new lustre, without being sticky or greasy. Furnished in eight-ounce bottles. Guaranteed not to harm the finest varnish. For sale by all Automobile Dealers. Price 60 cents per bottle.

The Miller Automobile Jack

The Miller Automobile Jack is a quick acting, automatic lowering jack, designed especially for automobile use, and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. It is high-grade and one of the finest finished jacks on the market. We guarantee this jack for twelve months. The list price of the Miller lack \$3.00 cech 100.

Firestone[®] Pneumatic Tires

THE TIRES OF STERLING QUALITY"

are today placing the highest standard for Pneumatic Tires, just as Firestone Solid Tires are the standard by which all solid tires are compared.

In their manufacture they are given the very best workmanship and the closest possible inspection, insuring absolute satisfaction to the user.

WE FURNISH TIRES TO FIT ANY RIM.

Branches and Agencies Almost Everywherere.

FIRESTONE TIRE & RUBBER CO., Akron, Ohio

The Severest Tests

have demonstrated time and time again that the principles employed in

Timken Roller Bearings

are the only correct ones that insure perfect transmission of all power to traction use, eliminating both friction load and end thrust.

A Stoddard Dayton Stock Car equipped complete with Timken Roller Bearings finished April 12th, a ten-day century run, 1,000 miles over the roughest roads with all adjustments sealed, something impossible for a car equipped with the ordinary

type of bearings to perform. This car, as do all cars of the **Stoddard Dayton** make, carries a full equipment of **Timken Roller Bearings**, as tests made under the most adverse and severe conditions have proven them an economical factor in the saving in wear and tear from strain alone.

And these are some of the reasons why more than 65 per cent. of all the makers of high grade American Automobiles and over 90 per cent. of the Commercial Truck builders are now using them.

Are you? If not, won't you let us give you some figures that prove. These are yours for the asking.

The Timken Roller Bearing Axle Company, Canton, Ohio Branches: 10 East 31st Street, New York 429 Wabash Avenue, Chicago

Maxwell.

THE RUMOR SEASON

is here again, just as it always comes with the regularity of the malaria germ, or the hay-fever, or the June-bug; only it becomes more virulent as it gets older.

The Whooper Company—so Dame Rumor says—will have a world-beater in the shape of a motor that has more cycles to it than you have fingers and toes, to sell at —\$. Just wait and see.

The Spouter Company has something up its sleeve that will be a combination of features as varigated as the ingredients in a mince pie, to sell at — \$. They will show you later.

The Holler Company has a new startler of the waittill-we-show-you-and-get-left kind, a conglomeration of metals so diversified as to make the most enterprising experimenter in the mixer of metals quit his job in disgust, and it will sell at — \$. A lick and a promise.

And so it goes on—if you have been in the business long enough you will know the story.

Not so facetious, but similar in trend, are the reflections as one scans the horizon of trade promises. I have been asked what we are going to do, and when I started to write this ad it was to give the answer:

We have found that with Maxwell principles of automobile construction and with honest manufacture and decent selling methods old terra firma is a good enough place to do business on and we are going to stay on earth, saving ourselves the trouble to come down again after the soaring flights of fancy in which some of our friends now indulge.

We are in the automobile business for the profits that are in it, and we are satisfied with the results. It pays to build the only good moderate priced automobile. Our dealers are satisfied, for they, too, find legitimate effort rewarded with a legitimate profit. Maxwell owners are satisfied, because they know that they possess a car that will give satisfactory service at minimum expense, every day in the year, and that looks as stylish and imposing—without extra charge for the style and imposition—as the highest-priced cars made anywhere. Being built upon well-tried design and honestly made they are free from the find-me-out-later-on handicap of some other manufacturers.

We will sell Maxwell cars, some ten thousand of them, at legitimate prices—prices high enough to give to our dealers and to ourselves a legitimate profit and low enough to give to every purchaser the full value of his money.

The only change we will make will be in the distribution of profits resulting from the sale of Maxwell cars. Here the new arrangement will favor the individual dealer, giving the hustler the hustler's reward. If you are a hustler we want you and you will want us So let's get together as soon as possible. Write to me now, telling me something of your territory and its sales possibilities, and I will communicate with you and tell you of the new Maxwell selling plan, the plan for business-getters.

What happened upon the announcement of the new

\$1400 Gille "Thirty"

When on May 31st we announced that work had actually commenced on the manufacture of parts for 10,000 high grade 30 horsepower four-cylinder cars of Cadillac quality, to be sold at \$1,400.00, it was naturally supposed that a certain amount of interest would be created. But honestly we did not expect it to "turn the automobile world upside down" so to speak. It seems, however, that it did, and after analyzing the situation we see that really it is no wonder that a cyclone of enthusiasm swept over not only America, but practically all over the civilized world, amongst dealers, users and prospective users.

Truly the Cadillac "Thirty" was what the world had been waiting for. No one realized this and "took the tip" more than the dealers themselves.

Let's see what happened:

The announcement was made to the public on Sunday, May 31st. On Monday we were almost flooded with telegrams from automobile dealers, of which the following are fair samples:

"Don't close agency for this territory until we see you. Will be in Detroit to-morrow."

"If will give us Cadillac agency will guarantee sale 200 cars. Ample deposit."

"Are you willing to renew contract for next year on basis double business."

"What deposit will you require on hundred new Cadillacs?"

"Will agree handle Cadillacs exclusively and deposit on hundred fifty cars."

On Tuesday the postman was overburdened and by the end of the week we were deluged. In addition to the immense number of inquiries from prospective buyers we received more than 300 letters from Automobile dealers offering to place orders for from 10 to 300 cars each with deposits. Our Sales Department was simply swamped. They could not even read all the letters, much less take up each individual case and handle it properly, so they had to resort to sending out form letters telling the applicants that their propositions would be considered as promptly as conditions would permit.

And the new "Thirty" will not be the only good thing. There will be others, including all the old standbys.

1909 will truly be a CADILLAC year

CADILLAC MOTOR CAR COMPANY.

Detroit, Michigan

It has been worth several hundred dollars to a good many motorists to learn by experience that

MORGAN & WRIGHT TIRES **ARE GOOD TIRES**

"Experimenting around" in the buying of tires might be a good policy if it was less expensive, but users of MORGAN & WRIGHT tires are thru with it.

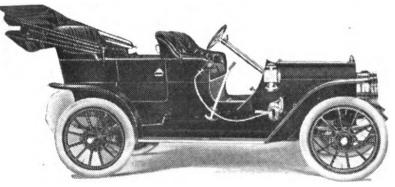

Mr. H. Sherer, of Detroit, who has "been thru the mill," says: "I have owned automobiles since 1902, and have had a great deal of practical experience with tires. In 1906 I shifted to foreign tires. I find, however, that MORGAN & WRIGHT tires give me the best results of all, and I have decided to use them exclusively."

You can rarely find a motorist who has experimented with other brands after trying our tires. Does that fact suggest anything to you?

MORGAN & WRIGHT, Detroit

Branches, Agencies or Dealers Everywhere

OAKLAN

Model B Touring Car, price \$1,350.00. Full equipment, including two gas lamps, two side oil lamps, one tail lamp, generators, horn, tools, jack, pump and batteries. Top, \$75.00 extra. Runabout, \$1,300.

(A combination of simplicity and efficiency designed for the man who scrutinizes the car he is to buy, who intends to himself operate it, and to whom economy in up-keep and running expense is essential.

I The live agent will find in the Oakland a car that appeals to a large and intelligent class of purchasers and that will justify the fullest confidence.

WHEAT BELT PROSPEROUS REGION

Reuschaw's Visit Causes Inspiring Reports of Demand for Cars—Fine Garages Built in Small Towns.

R. C. Reuschaw, sales manager of the Reo Motor Car Co., who came to New York last week, after a business trip through the wheat belt, Kansas, Nebraska, Oklahoma, and the Dakotas, brought with him glowing reports of the prosperity prevailing in that part of the country and of the keen demand for automobiles that has resulted.

The immense wheat crop. Rauschaw states, has lined the farmers' purses, and it is not an uncommon sight to see them drive into town, where they dive into their pockets and bring out a roll of greenbacks big enough to choke an ox, from which they peel off the price of a motor car almost as if it was an every day occurrence. To say nothing of others, Reuschaw himself brought back orders for five carloads of Reos which are to be shipped by express. The number and character of garages that are being crected is also impressive. In many places of 2,000 or 3,000 inhabitants the Reo man found fine modern, fireproof structures that would do credit to cities of even 100,000 people.

Fred C. Robie, of the Excelsior Supply Co., Chicago, who is in New York this week, confirms all that Reuschaw says. His company covers the West with a big force of men and does the bulk of the accessory business. The demand for supplies, he states, leaves no room for complaint and outside of the bigger cities, it has not been unsettled by price cutting.

Shanks Leaves Winton for Retailing.

Charles B. Shanks, for nine years identified with the Winton Motor Carriage Co., Cleveland, most of the time as sales manager, has resigned that office to engage in the retail business. He will open a store in Cleveland where, under his own name, he

will handle the Thomas-Detroit exclusively. Charles W. Churchill, manager of the Winton branch in New York, will succeed to the position left vacant by Shanks and Charles W. Mears, who, under Shanks's direction, has handled the Winton advertising, now will have full charge of that department.

Ex-Mayor to Sell Spare Wheels.

Sherburn Becker, former mayor of Milwaukee, is going into the spare wheel business. He has secured the Stepney representation for the State of Wisconsin. T. D. Grimke-Drayton, chairman of the Spare Wheel company's board of directors, is now in this country and is reported as being well satisfied with the progress that the Stepney wheel has made here.

M. & W. Branch Moves to Los Angeles.

Morgan & Wright have transferred their Pacific Coast branch from San Francisco to Los Angeles. Their representation in the former city has been turned over to a new firm, Weinstock, Nichols & Co., which was formed for the purpose of acquiring the agency.

Pope to Sell Columbia Steel Mills.

It is probable that the Columbia Steel Mills, Elyria, Ohio, which is one of the Pope Mfg. Co.'s properties, shortly will be disposed of by the receivers. They have been offered \$190,000 for it and negotiations for its sale at that price practically have been concluded.

New Factory Probable at Dayton.

Henry Arnstein, of Dayton, Ohio, who has built several cars styled the Big Four Flyer, is preparing to engage in the business on a large scale. The organization of a stock company and the construction of a factory in Dayton are included in his plans.

New Thomas Six at Popular Price.

The E. R. Thomas Motor Co., Buffalo, has under way a six-cylinder car which will list at \$2,500—a price which will compel a lot of notice to be taken.

POPE AFFAIRS ARE AIRED AGAIN

Creditors and Receivers Exchange Opinions in Chancery Court—Creditors' Chairman Assumes a New Role,

Reports that friction had arisen between the receivers of the Pope Mfg. Co. and the creditors' committee made it appear probable that the hearing of the receivers' petition to the Chancery Court of New Jersey for authority to continue the business would throw a strong light on the situation. The petition was heard yesterday by Vice Chancellor Howell in Newark and though it was plain that the creditors' committee wants its money in a hurry and in a large lump, the situation was not illuminated to anything like the anticipated extent.

According to the reports that were current, the chairman of the creditors' committee, who represents the note-brokers' interests, had "touched" the receivers for about \$40,000 for "services rendered" which suggestion promptly had been repudiated, as also was a second proposal of the same nature which, however, reduced the amount by several thousand dollars. However this may be, it is certain that Chairman · Swartwout's firm has addressed a communication to the banks involved proposing that the firm be allowed a 3 per cent, commission on all collections that may be made. This letter is said to have been issued without the knowledge or consent of the other banking representative and that as a result, some extremely emphatic opinions were exchanged between the two men.

The fact is that the Pope receivers have about \$1,250,000 in cash in the various States and that the creditors' committee is not content with the 25 per cent. dividend which has been declared and the 25 per cent. additional which is in prospect. Like Oliver Twist, they want more and without waiting for it. The receivers, while admitting that the funds in hand are sufficient for a larger dividend, contend that if it is

paid, it will cripple their resources and leave them without sufficient working capital to properly conduct and continue the business.

At the hearing yesterday, Receivers Pope and Yule were present, accompanied by the receivers' New Jersey counsel, Sherrard Depue, of Lindabury, Depue & Foulks, of Newark, and Mr. Yule's personal counsel, Scott McLanchan, and by L. H. Freedman, of Joline, Larkin & Rathbone, of New York. Of the creditors' committee there were present, R. H. Swartwout, chairman, and C. N. Gillett, secretary. committee was represented by Counsellor Percy S. Bryant, of Hartford, while Walter S. Schutz, also of Hartford, represented a number of small creditors. Messrs. Swartwout, Bryant and Schutz all voiced the same opinion, which was tersely expressed by Swartwout when he said:

"We want our money. If the stockholders want to continue the business, let them furnish the funds. The creditors get only the face value of their claims with interest; the stockholders get the rest."

"How much will it require to continue this business for a year?" asked the court. "About \$800,000," responded Receiver Pope.

Receiver Yule said they might be able to get along with \$600,000, but should have \$800,000, as manufacturing conditions have altered in the last two years.

Mr. Pope stated that the receivers will this week ship the last of the 1908 output of automobiles and for two months had been refusing orders and returning deposits. If permitted to continue the business and to make up 700 cars for next year, he said that all would be sold and deposits secured within three weeks.

Mr. Bryant disclaimed any intention on the part of the creditors' committee to criticize the receivers. He said they had done admirably and given full satisfaction to the creditors, but that they had not shown that they were manufacturing at a profit.

Receiver Yule responded that the report of the certified accountant would show that the business could be continued profitably.

The court inquired whether the creditors' counsel had asked to see this report, and if so, had they been refused. Mr. Bryant answered in the negative.

Vice Chancellor Howell then ordered that one copy of this report be given to the court and another copy to Mr. Bryant, also assuring Mr. Pope that it would not be printed. Pope had said its publication would give to business rivals valuable information regarding Pope manufacturing methods.

"It looks to me from the statements before me that you ought to be able to pay 75 per cent. in four months and have money enough to keep the business from going to the dogs," was one of the concluding remarks of the court. Chairman Swartwout. of the creditors' committee, rejoined:

"If we get 75 per cent, in four months it will be entirely satisfactory."

THE MOTOR WORLD

The Week's Incorporations.

Buffalo, N. Y.—Kane Motor Supply Co., capital increased from \$30,000 to \$50,000.

Rochester, N. Y.—United States Automobile Co.; capital increased from \$200,000 to \$300,000.

Durham, N. C.—Bull City Transit Co., under North Carolina laws, with \$25,000 capital; to operate automobile lines from Durham to Chapel Hill and other points. Corporators—J. T. Fowler, Zet Fowler, Ralph Smith.

Camden, N. J.—Motor Commercial Delivery Co., under New Jersey laws, with \$200,000; to manufacture automobiles, engines, etc., and general transfer and delivery business. Corporators—F. R. Hansell, W. F. Eidell, J. A. MacPeak, Camden.

New York City. N. Y.—United Motors Co., under New York laws, with \$100,000 capital; to manufacture motors, engines, machines, cars, carriages, wagons, boats, flying machines, etc. Corporators—H. T. Tobey, C. R. Hathaway, C. W. Cuthell, New York City, N. Y.

Brooklyn, N. Y.—Motor Safety Mfg. Co. of the City of New York, under New York laws, with \$100,000 capital; to manufacture motor appliances for automobiles, motor

boats, etc. Corporators—J. T. Barber, J. P. Carlson, G. Fey, Brooklyn, N. Y.

Joplin, Mo.—Century Automobile Co., under Missouri laws, with \$10,000 capital; to manufacture, repair and sell automobiles and automobile appliances. Corporators—Edward P. Rhodes, Frank M. Say, Frank A. Holden, Willard L. Butts, Charles W. Bartlett, H. G. Packer.

New York City, N. Y.—Universal Taxameter Co., under New York laws, with \$75,000 capital. Corporators—Harry M. Spence, 2159 Eighty-third street, Bensonhurst, N. Y.; Edward T. Moriarty, 39 West 130th street, New York City, N. Y.; Albert W. Bonynge, 1022 Hudson street, Hoboken, N. J.

In the Retail World.

Browning Bros. have purchased the Ogden (Utah) Automobile Co. The business will be removed about July 1st to the new garage on Grant avenue, which now is being erected for the Brownings.

The Fred A. Bennett Auto Co., which handles the Reo cars in Spokane, Wash., is building a new garage on Second avenue. in the "automobile section." Its completion is looked for about the first of July.

Ralph Hain and George M. Hurley, of Los Angeles, Cal., have formed the Hain-Hurley Auto Specialty Co., and "opened up" at 1205 South Main street. They will manufacture a timing device and other specialties and conduct a general repairing business.

The Penn Automobile Supply Co., of Philadelphia, has removed from its old quarters in the basement at 201 North Broad street, to a remodeled building at 236 in the same street. The entire building will be devoted to the company's business.

Dunn & Gore is the style of a new firm which has taken over the accessory and supply business of the A. S. Thompson Co., at 512 South Broadway, Los Angeles, Cal. The firm is composed of W. D. Dunn and G. R. Gore, the former of whom previously was connected with the Thompson company.

O. A. Clark, president, and C. C. Henry, have disposed of their interests in the Pope Auto Co., Newark, N. J., and the Summit (N. J.) Auto Co., to B. C. Fincke, who becomes president, and C. A. Dickson, secretary-treasurer. The Summit establishment is conducted as a branch of the Newark concern.

Henry Goes to Everitt-Metzger-Flanders.

David C. Henry, formerly of the Electric Vehicle Co. and latterly with the Columbus Buggy Co., has engaged with the new Everitt-Metzger-Flanders Co., Detroit, and will cover territory in their interests.

Morley Diamond Manager at Detroit.

Bert Morley has been appointed manager of the Diamond Rubber Co.'s branch in Detroit

Increased Demand for Accessories.

The prediction, made by W. B. Miller, secretary of the Diamond Rubber Co., in a rather widely published interview last December, that even though the automobile business in general for 1908 might be much smaller than in 1907, the accessory manufacturers would have an active year, has been more than confirmed. As a matter of fact, the Diamond people say that the prediction did not go far enough, so far as their own business is concerned. Since March, the Diamond factories have been working to their fullest capacity, and the daily tire production was never so large as it has been during the past three months. This applies not only to the manufacture of tire casings, but inner tubes as well. A notable feature of the demand for tires tire casings, but inner tubes as well. The increased demand for quick acting rims, also, has thus far prevented the Diamond company from moving the factory in which the Marsh rim is made, from Columbus, Ohio, to the general factories at Akron, as will ultimately be done.

Prizes for Expertness in Tire Replacement.

Anyone who fancies that he is "quick on the trigger" needs but to present himself at the Continental Caoutchouc Co.'s headquarters, Broadway and Fifty-eighth street, New York City, on Friday, 26th inst, to prove or disprove his belief. On that date, the Continental people will give prizes of \$15, \$10 and \$5 in gold, to the persons who replace a Ready-Flated tire with others of the same kind in the shortest time, and next shortest time, respectively. While the competition is intended for chauffeurs, anyone else will be permitted to compete. Three trials will be allowed, and the time be taken on watches that register fifths of seconds.

The Auto Taxicab Co., recently incorporated with a capital of \$30,000, to operate in Chicago, has leased the first floor of 2441-2443 Michigan avenue for five years.

ADDING TO E. V. CASH BALANCE

Receivers' Report for May Shows an Increase of \$20,000-Sales Account Amounts to Over \$66,000.

Halsey M. Barrett and Henry W. Nuckols, receivers of the Electric Vehicle Co., Hartford, have filed in the Connecticut Superior Court a report of their transactions during the month of May. The statement shows:

Greuter Leaves the Matheson Company.

Charles R. Greuter, who since 1903 has been the designer for the Matheson Motor Car Co., Wilkes-Barre, Pa., has resigned, giving ill health as the cause. He will spend some time in a New York hispital having his leg, which was injured, treated. Later he expects to join another large automobile company.

New Cadillac "Thirty" Nearly Ready.

The new Cadillac "Thirty," the announcement of which at \$1,400, caused something of a furore, is so far advanced that it will be ready for the inspection of all agents who visit Detroit after July 1st. Sales Manager Benson states that deliveries positively will begin in September.

Remy Books Biggest Order for Magnetos.

What is believed to be the largest American order for magnetos ever placed just has been booked by the Remy Electric Co., Anderson, Ind. It was given by the Buick Motor Co. and calls for 10,000 instruments. Motor Co. and its call is for 10,000 instruments

WHITE WINS

Partial Summary of Victories, May, 1907-May, 1908

Perfect Score in Harrisburg Endurance Run

Tieing with three other cars in the contest of May 5th-6th, 1907. For the result of the "run-off," see below.

Fastest Time in Wilkes-Barre Hill-Climb

Defeating 45 high-powered gasolene cars, in the great contest on Decoration Day, 1907.

Fastest Time in Cleveland Hill-Climb

Defeating 40 high-powered gasoline cars.

Fastest Time in California Hili-Climb

Defeating the fastest of its gasoline competitors by nearly two minutes on the 27% mile hill at Witter.

Perfect Scores in Sealed **Bonnet Contest**

Both White cars entered made perfect scores in this contest conducted by the Automobile Club of America.

Officially Observed Non-stop Run of 1871 Miles

Held under the auspices of the Royal Automobile Club of England and certified by that organization.

Fastest Time of the Season on the Track

One mile in 1:02, ten miles in 12:54, and twenty-five miles in 29:07 at the Santa Rosa Track Meet.

Officially Declared Most Efficient Car

In the South Harting hill-climb, conducted by the Royal Automobile Club, the White won the contest because it developed at the rear wheels a greater percentage of its assigned horsepower than did any other car. The rating assigned to the White was 50 horsepower.

Wins English Dust Trials

Proving officially that it raises less dust than any other

Clean Sweep in the Glidden Tour

Three White entries make three perfect scores.

PITTSBURG, 138-148 Beatty St. CLEVELAND, 407 Rockwell Ave.

Won Hower Trophy

The single White runabout entered in the Glidden Tour defeated a dozen high-priced gasoline runabouts competing for this prize.

Won California Reliability Contest

In the original contest held September 20th, two Whites tied with two gasoline cars. In the "run-off" held November 15th and 16th, both Whites made perfect scores, while both gasoline cars were penalized.

Won Quaker City Endurance Run

In this contest, held January 1st, 2d and 5th, the White vanquished 27 gasoline cars of 23 leading makes, winning the MacDonald & Campbell trophy.

Fastest Time in San Francisco Hill-Climb

Winning the free-for-all, the \$2,500 class and the \$3,500 class.

Fastest Time in the New York **Carnival Hill-Climb**

Making the ascent of Fort George hill in 321/3 seconds, compared with the best gasoline time of 36 seconds; largest entry list of any hill-climb ever held.

New San Francisco-Los Angeles

The White car made the 478-mile mountainous journey in 17 hours and 17 minutes, cutting 56 minutes from the previous

Double Victory in Harrisburg **Endurance Run**

The single White entry was the only touring car to make a perfect score, winning the principal 1908 trophy, the Board of Trade Cup, and also the 1907 prize in a "run-off" with last year's other perfect-score drivers.

Perfect Score in Detroit Endurance

Dealers Who are Deceiving Themselves.

If certain prophets are to be believed, there is a rod in pickle for not only the American Automobile Association, but for the misnamed Automobile Club of America and the National Association of Automobile Manufacturers.

The rod has been placed in the brine by "a dozen or more dealers" who, according to the seers, "have assumed the responsibility of racing and paid most of the bills, while the manufacturers have reaped most of the benefit." These men, according to the wiseacres, "declare that they do not intend to sit back, and have the manufacturers or the warring automobile organizations tell them whether they are to eat flesh, fish, or good red herring, but intend to do some of the ordering themselves."

In short, these "dozen or more dealers" mean to "take over the control of racing" if sanctions are withheld, or men are disqualified whom they think should not have been disqualified. It is a prospect sufficient to make any organization tremble. But if the "dozen or more dealers" have any real friends, the latter should take them aside and very earnestly whisper the word "Don't" into their ears.

What is wanted for the lasting good of the sport is not more trade influence, but less of it. The sport has been made so very much like a business that the genuine sportsman never has had a ghost of a chance. If this were not the case, the manufacturers and dealers who complain of the expensiveness of competition, now would have less cause for such complaint. What automobiling as a sport requires, is men who compete for love of the sport and not for the advertising there is in it; and the sooner the truth is realized, the better.

There is no room or justification for a trade controlled sport. There is no surer way of exciting suspicion and of killing it than by placing the government in the hands of men whose inspiring motive is self-interest. Undoubtedly there are not a few men on great newspapers, and others not so great, which receive the favors of "a dozen or more dealers" who will find it profitable to lend hope and cognizance to the latter; but the result is inevitable, though it may not become apparent until, as always is the case, their favors shrunken, the great papers drop the dealers and their cause, like so many squeezed lemons. It were well to remember that not so very many years ago these "great papers" devoted quite as much space to cycling as they now devote to automobile sport.

Electric Vehicles, Real and Unreal.

Electric vehicle mileage is not the vexed question it was at one time. Nevertheless it furnishes considerable food for thought and argument, and if not wisely treated tends to the development of types which are neither practical nor destined to prove a lasting credit to the trade. In short, the storage battery has been in general use for so long a time, and the science of electricity is so thoroughly explored that makers of electric vehicles are placed in a class which is pretty uniformly restricted as to its products, in that stress of competition and general enlightenment have combined to place its members on a pretty nearly even footing. That it is not the custom to build vehicles for very high mileage, or very high speeds, is, therefore, proof that such constructions are not economical in the broadest sense. Generally speaking, the radius

of the well-designed electric vehicle is sufficient for the service for which it is intended, while the possibility of changing batteries makes its extension easy where regularly scheduled routes are to be covered. The speed of this class of vehicle too, is all that is properly required for the city traffic, to which it is most properly suited.

This being the case, it follows that in such vehicles as are sometimes produced with certain specific recommendations of one sort or another, those qualities must have been attained at the expense of certain other, unenumerated factors, which are taken into consideration by the majority of makers. The result is that while the vehicle generally will come up to the performance predicted by its makers, it does not always prove as economical to run, or as durable, as others about which no such claim is made.

If the requirement of its owner is that of high speed, or great mileage, relatively speaking, then it may be such a vehicle will fit into his service in an economical way. Otherwise, the chances are that he will find the machine unduly expensive either to run or to maintain and that it will not prove a profitable investment to him.

It is well known that by the use of lightweight, single tube tires, thin plate batteries, and light carriage work, a very different performance in the matter of both mileage and speed may be obtained, from that obtainable with what may be termed the more standard types of vehicle. These methods are expensive, however. Thin battery plates are short lived, and liable to give way at any time under stress of excessive load, suddenly applied. Light tires, while reducing the vehicle resistance on the road and also the battery consumption, are not long lived, nor are they as proof against injury as those which are more commonly used. The evils due to light frame and body construction are equally patent in a vehicle which has seen service.

The point is that buyers of electric vehicles should consider carefully before purchasing, whether their requirements are those which are to be satisfied by the average representative electric, or whether they exceed its capabilities in any way. If they do, such a "special" type may prove advantageous. More likely, however, a vehicle of either the steam of gasolene types would serve to better advantage. The powers of the thoroughly reliable electric are pretty well defined. Progress in its development must be relatively slow, simply because the

field has been so thoroughly explored. Rational improvements are to be encouraged and are to be expected in no small number and significance. But the buyer without experience in this line, should beware of investing in constructions which are distinctively radical, or which are supported by "world-beating" claims.

The Matter of Tire Inflation.

To the average man who has been accustimed to thinking of pneumatic tires as either "hard" or "soft," and so, as either in suitable or unsuitable condition for use, it is a striking idea that the actual pressure to which any given tire should be inflated must relate largely to the construction of the tire-not in the sense of its resistance to blowouts due to excessive internal pressures, but to the relative durability of the rubber and fabric combination in withstanding the effects of repeated flexure. This, it appears, is the case with tires applied to heavy vehicles more particularly, as the use of very hard tires in such machines, throws a much heavier duty on the springs than it is absolutely essential they should carry. With the lighter vehicle, more resilience may be derived from the springs and less proportionately, from the tires. But even here, the degree of tire-inflation must be proportioned to the structure of the tire walls as well as to their strength.

The question which has been raised as to the effect of inflation pressures on the speed of racing cars, is likely to provide not a little enlightenment in the matter of the general requirements in regard to inflation. S. F. Edge, proved to his own satisfaction on the Brooklands Motordrome, that the speed of the car was but little influenced by variations in tire pressure. Supposing this to be absolutely so in a general way, the comfort of the touring motorist might be speedily increased to no small extent by the use of tires of comparatively low inflation, but capable of withstanding the effects of continued flexure.

Against these conclusions the results obtained on a dynamometer by Mr. Alex. Churchward, given in another column, appear to prove the reverse to be the case. Yet it is to be observed that his results were determined under conditions paralleling those of the perfect road, while the results of corresponding tests made on a highway were it possible to obtain them, might show less gain for the high inflation pressure, owing to its bounding action and the consequent loss of traction involved through

slipping of the wheels. Actually, of course, the amount of the traction resistance in proportion to the windage becomes so low at speeds above the normal that inflation pressures probably play but a small part in the total amount of power consumed, so that the variations involved are of comparatively slight moment. At moderate and low speeds, especially with light vehicles, it is of greater consequence. But even here the cost of power is sufficiently low so that the designer can afford to sacrifice something to the comfort of the passengers, if necessary.

The very evident conclusion is that lower inflation pressures than have been thought advisable hitherto may be used without serious loss, in any type of vehicle. The result will be less strain on the springs, less shock to the mechanism of the car and to the occupants, and longer life for both. Such a reduction must be subject to the dictum of the tire makers, however. For with a tire run partially "slack," the bending of the walls is greatly increased, and the strains in the structure are augmented proportionately. There is no doubt that the degree of hardness to which many tires are inflated renders them of no more comfort than a solid tire. Hence any possible advance in this direction must be counted a direct gain to the user.

One of our contemporaries which so regularly follows the lunch route that its contents usually are suggestive of "suds" and seafoam, has discovered that the word "or" in the Ostend rules, will permit six-cylinder cars, as well as four-cylinder ones—which are specifically named—to compete in the outlaw race for foreign cars in Georgia this Fall. It is hoped that the "discovery" will assist in relieving our contemporary from its awkward and painful effort to straddle and afford it an excuse for assuming the position it is so anxious to assume. It properly belongs on the anti-American side of the fence.

"In every sport that is conducted, the box office has something to say about its control."—Opinion credited to one of "a dozen or more automobile dealers."

Bosh! At any time the box office has anything to say about the control of sport, it is time for that sport to curl up and die. "Box office control" is the one sure way of befouling sport. It is the basis of practically all the fraud and fakery that ever is perpetrated.

COMING EVENTS

June 18, Washington, D. C.—Washington Lodge of Elks' race meet at Bennings track.

June 18, 19, Atlanta, Ga.—Fulton County Automobile Club's 382 miles sealed bonnet endurance contest to Macon and return.

June 19, Hartford, Conn.—Automobile Club of Hartford's gymkhana meet at Luna Park for benefit of Hartford Hospital.

June 20, Buffalo, N. Y.—Buffalo Country Club's annual gymkhana games.

June 20, Oakland, Cal.—California Woman's Automobile Club's endurance run to San Jose and return.

June 24, 25, 26 and 27, Chicago, Ill.—Chicago Motor Club's 1,200 miles reliability run to Dixon, South Bend, Joliet and Chicago.

June 24, 25, 26 and 27, New York and Philadelphia—Monroe County Automobile Association's dual reliability run to Stroudsburg, Pa., and hill climbing contest and carnival at Mount Pocono.

June 27, Minneapolis, Minn.—Minneapolis Automobile Club's annual hill climb.

June 27, Norristown, Pa.—Norristown Automobile Club's hill climbing contest on Skippack hill.

June 30, Rockville, Conn.—Rockville Automobile Club's hill climbing contest on Ned England hill.

July 3-4, Wildwood, N. J.—Motor Club of Wildwood's annual automobile carnival.

July 4, Pueblo, Col.—State Fair Association's meet at fair grounds track.

July 4, Glens Falls, N. Y.—25 miles stock car race at mile track.

July 4, Baltimore, Md.—Motor Car Racing Association's meet at Pimlico track.

July 4, Long Branch, N. J.—Elkwood Park Automobile Association's meet at Elkwood Park track.

July 4, Cape May, N. J.—Quaker City Motor Club's race meet and carnival.

July 4, Lowell, Mass.—Lowell Automobile Club's 250 miles road race on Merrimac boulevard.

July 9, Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

July 15, St. Paul, Minn.—Automobile Club of St. Paul's meet at Hamline track.

July 15, Huntington, N. Y.—Huntington Automobile Club's carnival and races.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

January 16-23, New York City—Association of Licensed Automobile Manufacturers' annual show in Madison Square Garden.

DIVIDED HONORS ON PORTER HILL

Haupt Fastest in Cleveland Climbfest—Miller Captures Four Events—Woman Wins a "Championship."

If the title means anything, the Cleveland Automobile Club's annual hill climb, held on Porter hill, 23 miles from that city, on Saturday afternoon last, 13th inst., enabled Mrs. K. L. Otis to style herself the the finish. A ship's chronimeter is attached to the time recording device which registers the fractions of seconds in tenths.

Porter hill is considerably steeper than any of the former climbing grounds of the Cleveland motorists and there was some doubt as to the ability of some cars to climb it when the place was suggested. How little the critics of the course reckoned with the ability of present day automobiles to negotiate inclines was demonstrated when even the electric cars rolled up without any

caught the fancy of the crowd, Albert Miller received as much aplause, when he won four of the regular events and pushed Haupt hard in the free-for-all. The latter's time in the free-for-all was 42.9 seconds, and the record was made in a special trial a short while afterward. For general all-around efficiency as brought out in the piston displacement handicap the technical committee found that W. A. Bourke's Knox had carried off the honors; its time was 51.8 seconds. The summary:

Stock cars, \$850 and under—Won by L. E. Manley, Ford. Time, 128.3.

Stock runabouts, \$850 to \$1,250—Won by C. P. Brockway, Overland. Time, 1:17.3.

Stock touring cars, \$850 to \$1,250—Won by C. D. Paxon, Jackson. Time, 1:52.2.

Stock runabouts and roadsters, \$1,250 to \$2,000—Won by C. D. Paxon, Jackson. Time, 0:55.4.

Stock runabouts and roadsters, \$2,001 to \$3,000—Won by A. C. Miller, Stoddard-Dayton, 0:54:4; second, W. A. Bourke, Knox, 0:55.7; third, C. D. Paxon, Jackson, 0:56.4; fourth, A. C. Miller, Stoddard-Dayton, 0:59.2.

Stock touring cars, \$1,001 to \$3,000—Won by A. C. Miller, Stoddard-Dayton, 1:03.6; second, Andrew Aubel, Oldsmobile, 1:52.2.

Amateur championship Cuyahoga county—Won by Mrs. K. R. Otis, Stearns, 0:54.6; second, F. W. Work, Oldsmobile, 0:54.7.

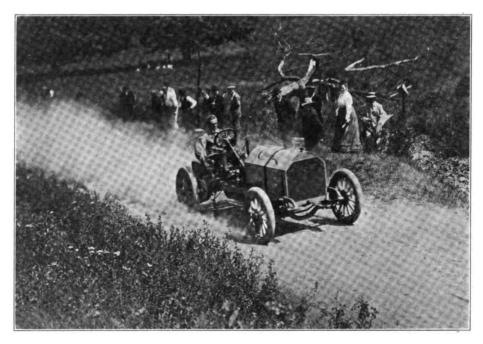

Electrics, \$2,000 and under—Won by W. F. Plistine, Columbus, 1:15; second, E.

A. C. MILLER (STODDARD-DAYTON) WINNING ONE OF HIS FOUR VICTORIES

amateur champion hill climber of Cuyahoga county. Driving a 40 horsepower roadster, she made the ascent in 543/5 seconds in the event labeled "championship." She was, of course, the feature of the day, but what would have been said of the club, in the event of accident, for permitting a woman to compete is another story. Mrs. Otis did not make the fastest time of the day, however, as William Haupt, of Philadelphia, who has been performing a great many hill climbing stunts this season, made the best time of the afternoon when he piloted his six cylinder car up the 16.9 per cent. grade in 36 seconds. The real honors of the day went to A. C. Miller, whose Stoddard-Dayton won four of the regular events and ran second to Haupt in the free-for-all.

Despite its distance from Cleveland, Porter hill attracted a fairly large gathering. Nearly 150 cars made the trip from the city and reinforced by more than a thousand countrymen from the surrounding district probably 2,000 people saw a long program decided. A new timing device, the invention of Walter C. Baker, of Cleveland, was tried with success. The instrument, which is similar in many details to a time recording clock, has its dial covered with paper, over which a fountain pen-like instrument traces a line, continuous except at the start and finish of a race. At the start the line jogs outward, then onward sharply, the change in course of the line being similar at

WILLIAM HAUPT (CHADWICE) MAKING THE FASTEST TIME

trouble and really made fast time, compared with the gasolene cars. The course was a little dusty, but in other respects ideal for the purpose. A long rolling road, stretching straight ahead for a clear half mile, made an excellent track for a hill climb.

While Haupt's work was nothing short of sensational, as he drove with a daring that

Gruenfeldt, Baker, 1:33.9; third, F. S. Peck, Babcock, 1:34.5.

Electrics, \$2,000 and over—Won by E. Gruenfeldt, Baker, 1:00.7.

Six cylinder stock cars—Won by William Haupt. Chadwick,, 0:41.

Stock cars weighing 1,432 to 2,204 pounds
—Won by A. C. Miller, Stoddard-Dayton,

0:46.8; second, W. A. Bourke, Knox, 0:51.1; third, C. D. Paxon, Jackson, 0:53.5.

Stock cars weighing over 2,204 pounds—Won by William Haupt, Chadwick, 0:41.2.

Piston displacement handicap—Won by W. A. Bourke, Knox; W. W. Partridge, Great Arrow; third, A. C. Miller, Stoddard-Dayton.

Free-for-all—Won by William Haupt, Chadwick, 0:42.9; second, A. C. Miller, Stoddard-Dayton, 0:45.7; third, C. D. Paxon, Jackson, 0:50.6; fourth, J. M. Watson, Corbin, 0:50.8; fifth, W. A. Bourke, Knox, 0:52.7.

Time trials for record—By William Haupt, Chadwick. Time, 0:36 (record for hill).

Columbus to Have a "Trouble Race."

Such sport as never has been seen before in Columbus, O., is promised in the automobile races to be run at the festival of the Eagles in the Driving Park there on June 19th. They will be in charge of the Columbus Automobile Club, and the principal event will be a 100 miles race for stripped catalog stock cars, open to local owners or drivers. A city championship is another of the events; but the one that probably will create most enjoyment will be what is termed a "trouble race" of 11/4 miles for five-passenger touring cars, each to carry observer, driver and three passengers. The cars will be started at the three-quarter pole, with a box of sand attached to each, run to the wire, detach the box, run to the firstquarter pole, change the inner tube or tire complete on the rear wheel, run to the second-quarter pole, stop the engine, passengers and driver dismount, run to the thirdquarter pole, light all five lamps and finish with all lights burning. Demountable rims and electric lights will be barred and the tires must be inflated with a hand pump.

Cash Prizes for St. Paul Meet.

Several noted drivers and cars are expected to take part in the St. Paul Automobile Club's meet at the Hamline track, St. Paul, on Wednesday, July 15th. In addition to the trophies for each of the six events there is to be a cash prize for each race with the exception of the club championship. The program is: Five miles, stock chasses of 60 horsepower and under; prizes, a silver cup and \$100. One mile, flying start; one mile track record, silver cup and \$200. Twin City championship, five miles, for fully equipped stock cars, Minneapolis and St. Paul club to each nominate one car: the Twin City championship cup to go to winning club and gold watch fob to winning driver. Five mile match for professional drivers and racing cars, flying start, best two out of three five-mile heats, with not more than two cars in a heat: silver cup and \$150 to winner. Ten miles handicap, silver cup and \$100. Twenty-five miles, stock chasses of 60 horsepower and under; silver cup and \$150 to winner, and silver cup for second place.

SIMONS WINS KANSAS CITY PRIZE

Decision on the Run-Off Reached by Review of Records—Particulars of the Several Scores.

It has now been decided that Carl J. Simons, Oldsmobile, won the run-off of the tie in the Kansas City Automobile Club's endurance which was held on June 9th. The original run was held on May 16th, but as 17 cars finished with perfect scores it was decided to make the perfect scorers run the contest over again to decide the winners of three cups. As stated in last week's Motor World, the tie was run on Saturday, 9th inst., but it was not until several days later that the scores were announced. After a careful review of the cards the committee has announced that Simons wins with a score of 840 points out of a possible 1,000. F. F. D. Morairity, Stevens-Duryea, was second with 795; W. S. Hathaway, Maxwell, third with 770, and H. Holzhauer, Pope-Hartford, fourth with 696. The scores of the other four cars to finish are low, a brief summary of the particulars upon which the relative standing of the cars was based being as follows:

H. E. Rooklidge, White—Vaporizer replaced, boiler feed stopped up, seals broken, damaged wheel and fender, time, engine stopped; penalty, 795 points; score, 205.

F. D. Moriarty, Stevens-Duryea—Broken radiator seal, both rear fenders broken, one rear spring flat, time; penalty, 205; score, 795.

Carl J. Simons, Oldsmobile—Broken radiator seal, rear axle sprung, behind schedule; penalty, 160; score, 840.

Roy Sanborn, Stanley—Fusible plug blown out, stop for gasolene, behind schedule; penalty, over 1,000.

H. Holzhauer, Pope-Hartford—Bonnet seal broken, damaged fender, behind schedule; penalty, 304; score, 696.

W. S. Hathaway, Maxwell—Bent steering knuckle replaced, radiator seal broken, front axle sprung, behind schedule; penalty, 230; score, 770.

M. C. Nolan, Stevens-Duryea—Ignition adjustments, all seals broken, motor dead 52 miutes, fan belt repaired, one rear spring flat, front fender loose, behind schedule; penalty, 825; score, 175.

W. M. Goodrich, Studebaker—Missing motor, pump attached to force gas to carburetter, loose spokes in rear wheel, replaced spark plugs, broken radiator seal, behind schedule; penalty, 988; score, 12.

Colorado Schedules a Strenuous Run.

As the earth's surface in Colorado is not quite as level and smooth as is to be found in some other places the 500 miles sealed bonnet reliability run to be held in northern Colorado July 2, 3 and 4, is likely to prove the most strenuous contest of the

sort ever held. The first day's run from Denver to Fort Morgan and return is over picturesque but rocky and uncertain roads, and it is expected that many cars will fall by the wayside on that portion of the run. The route on the second day is from Denver to Fort Collins, Greeley, Boulder, returning to Denver, while the final day will take the contestants to Colorado Springs and return. All adjustable parts will be sealed, and no adjustments or replacements. however trifling, will be permitted. Different schedules will be arranged for the different powered cars and being late or early at any of the controls will result in a debit of three points for every minute. The rules have been made so exacting that the promoters do not expect that any cars will finish with perfect scores, but they aver that it, will prove the most exhaustive test of motor cars ever witnessed by the people of that section.

Savannah Secedes to Get a Race.

The Savannah (Ga.) Automobile Club, which wants a road race so badly and doesn't care how it gets it, has completed its pitiable somersault by resigning from the American Automobile Association in order to assist the disgruntled Automobile Club of America in conducting a road race for foreign cars on American soil. The A. C. A. had one other spasm of delight late last week, apparently due to a "hoax." According to its press bureau, it received a telegram asking for an entry blank and stating that an Acme 6-cylinder car would be entered for its Hessian race, the inference being that the message came from the Acme Motor Car Co., who, unfortunately promptly repudiated it. Whether it was the Savannah club's action or the alleged telegram that caused it, it is certain that "Bobby" Morrell, the A. C. A. chief bandagewearer, "Baron" Schwarzkoff, who carried Europe on his shoulders for several years and who recently distributed broadcast postal portraits of himself—he has won 7 fourth prizes at beauty shows-and several other unusual Americans, joined in a dinner of mutual admiration at Hotel Astor.

Endurance Run to Precede a Carnival.

An "invitation endurance run" from Philadelphia to Wildwood, N. J., will raise the curtain to the Fourth of July meet of the Motor Club of Wildwood. The endurance run will take place on July 3d and that night there will be an illuminated automobile show on the boardwalk. A decorated parade will be the feature of the next morning and in the afternoon the straightaway races will be held on the Central avenue boulevard. Nine events at one mile have been programmed, as follows: Gasolene cars selling under \$1,250; gasolene cars selling from \$1,251 to \$2,000; gasolene cars from \$2.001 to \$3.000; gasolene cars from \$3,001 to \$4,000; four cylinder cars selling above \$4.000; six cylinder stock cars; free-for-all: steam stock cars only, and time trials.

KEPT 6000 SPECTATORS GUESSING

Half Century Event at Point Breeze Won by Frease—Other Spirited Features of a Successful Meet.

With perfect weather, good management, the presence of 6,000 enthusiastic spectators, and spirited racing, the Quaker City Motor Club's meet at the Point Breeze track, Philadelphia, Saturday afternoon last, 13th inst., was a big success in spite of the supposedly unlucky day of the month. By reason of its large number of starters—fourteen—the 50 miles stock car race was the feature event of the day and the race was so contested that the winner was not apparent until within a few miles of the finish

It was the last event on the program and the excitement began when the starter gave the pistol to the 14 drivers. The field got away in a bunch and it was nothing short of miraculous that they got around the first two turns without accident. On the back stretch of the first mile Robert Morton, Pullman, jumped into the lead and with the others strung behind him came down the stretch for the first time. Wallace H. Owen, American, was close behind and this order continued for eight miles when tire trouble caused Morton to slow up and Owen took the lead. It did not take Morton long to get a new tire and then he went after Owen, who had been plugging away in front. Owen headed the procession for 25 miles before Morton cut down the lead and passed amid cheers from the grandstand. His lead was short-lived, however, for in the 28th mile he was obliged to leave the track again, and Edwin H. Frease, Autocar, who had been jogging along at a steady pace all the while nosed to the front. After that Frease was never headed but the race was exciting from the fact that the others made a valiant effort to overhaul him, while at the same time, J. F. Brown, in another Autocar, had been hammering at the remainder of the field with such good effect that he finally landed in second position. Perhaps the most consistent race of all was driven by Frank Yerger, Studebaker, who was looked upon as a likely winner until a puncture temporarily put him out of the running in the 46th mile.

The meet was started at half-past one o'clock, with two events for little cars, and the first, at one mile, drew three contenders, a Buick, with Wilkie at the helm; a Maxwell, driven by David, and a Ford, with Graham up. Wilkie captured the cup and also got the next event, at three miles.

The third race brought out the higherpowered cars and Jack Harkin, Thomas-Detroit, looked a sure winner until the fourth mile, when Morton snatched the lead from him; another Pullman, driven by C. B. Kirkham, slid in for second place. Only two cars started in the next race for touring cars and William Fritag's Mitchell beat David's Maxwell. In a special event for Autocars John Archfield ran three miles in four minutes flat, defeating Brown and Frease, in this order, by a narrow margin.

After this Leonard Zengle made his appearance with his Pennsylvania car and had a lot of fun in the fifth race. Zengle, Owen (American), and Van Tine (Garford), were scheduled to go five miles, but after three ineffectual attempts to get a flying start, Owen withdrew and let Zengle and Van Tine fight it out. The former won the event easily.

The last event before the half century was put on was at 10 miles for high-priced cars and it developed into a match between Charles Howard, Thomas Flyer, and Wally Owen, American. The Garford car ran all right for eight miles, but a puncture put a stop to it. Up to that time the race was the best of the meet, as shown by the slight difference in time at the finish. The Thomas won by two-fifths of a second. "Wally" Owen was particularly unfortunate. After getting through the meet without accident he broke his wrist in two places while cranking his car preparatory to starting for home. The engine kicked and the crank did the rest. The summaries:

One mile for stock runabouts, \$850 or under—Won by Edward Wilkie, Buick; second, J. F. Graham, Ford; third, William N. Davids, Maxwell. Times, 1:34, 1:373/5, 1:443/6.

Three miles for stock cars, \$850 to \$1,250—Won by Edward Wilkie, Buick; second, William Fritag, Mitchell. Times, 4:241/5 and 5:011/5.

Five miles for stock cars, \$2,001 to \$3,000—Won by Robert Morton, Pullman; second, C. B. Kirkham, Pullman; third, Jack Harkin, Thomas-Detroit. Time, 6:17.

Five miles for stock touring cars, \$1,251 to \$2,000—Won by William Fritag, Mitchell; second, William David, Maxwell. Time, 7:21.

Five miles match—Won by Len Zengle, Pennsylvania: second, A. G. Van Tine, Garford. Time, 6:27.

Ten miles stock cars, \$2,001 to \$3,000.— Won by Robert Morton, Pullman; second, C. B. Kirkham, Pullman; third, J. F. Brown. Autocar. Time, 12:2734.

Ten miles, stock cars, \$4.001 or over—Won by Charles Howard, Thomas Flyer; second, Wallace Owen, American. Times, 12:00% and 12:00%.

Fifty miles free-for-all stock cars—Won by E. H. Frease, Autocar; second, J. F. Brown, Autocar; third, Frank Yerger, Studebaker; fourth, Wallace Owen, American. Time, 1:06:51.

One mile time trials—Won by Len Zengle, Pennsylvania, 1:10; second, Charles Howard, Thomas Flyer, 1:16; third, A. G. Van Tine, Garford, 1:18.

Three miles special for Autocars—Won by John Archfield; second, Jos. Brown; third, E. H. Frease. Time, 4:00.

FIGHTING THE RHODE ISLAND LAW

Question of Constitutionality Taken to the Supreme Court—Right to Impose Graded Tax the Main Issue.

The right of the State of Rhode Island to impose upon automobile owners an annual tax graded by the horsepower of their machines is the main point at issue in a case now before the Supreme Court of the State, whereby the constitutionality of the recently enacted law is to be tested. This case was made up by the refusal of Jefferson K. Crafford to pay a fee of \$15 for the registration of a car which he bought on June 9th, and his consequent failure to secure registration. Then, through Walter H. Barney, a petition for a writ of mandamus was filed with the Supreme Court. Crafford is chauffeur for William Penn Mather, president of the Rhode Island Automobile Club, and his proceedings in this instance are practically the result of action taken at a meeting of the board of governors of the club, on advice of the laws committee to contest the new law on the ground of nonconstitutionality.

Crafford's petition for a writ of mandamus requiring the State Board of Public Roads to receive his statement and grant registration for his machine, says in part:

"That the refusal of said boar I to receive said statement from your petitioner or to register said motor vehicle to assign a distinguishing number or mark or to issue to your petitioner a certificate of registration of said vehicle unless and until a fee of \$15 is paid, as by said board demanded, is unlawful for the following reasons, viz.:

"1. There is no law requiring such a payment and a prerequisite to the filing of said statement the register of said vehicle, the assigning of a distinguishing number or mark and to the issuing of a certificate of registration, as requested by your petitioner of said board as aforesaid.

"2. The provision of said section 8 of said chapter 1592, insofar as the same requires the payment of certain fees graded in accordance with certain classifications of motor vehicles by horsepower as therein set forth for the certificates provided for by section 2 of said chapter 1592 of the Public Laws, are unconstitutional and in violation of the provisions of section 2 of article 1 of the Constitution of Rhode Island and Providence Plantations.

"3. That said provisions of said section 8 of said chapter 1592 are unconstitutional and in violation of the provisions of section 16 of article 1 of the Constitution of Rhode Island and Providence Plantations.

"4. That said provisions of said' section 8 of said chapter 1592 are unconstitutional and in violation of article 5 of Amendments to the Constitution of the United States of America.

"5. That said provisions of said section 8 of said chapter 1592 are unconstitutional and in violation of section 1 of article 14 of the amendments to the Constitution of the United States of America.

"Wherefore your petitioner most humbly prays for this Honorable Court to issue a writ of mandamus out of and under its seal, requiring and enjoining the said John F. Richmond, William C. Peckham, Frederick E. Perkins, Robert B. Treat and John H. Edwards, as they are members of and the State Board of Public Roads, to forthwith receive from your petitioner said statement and file the same, and to register said motor vehicle and assign to it a distinguishing number or mark and to issue a certificate of such registration to your petitioner; and that such further order may be made in the premises as justice may require and to your honors may seem meet. And so your petitioner will ever pray."

African Explorer Delayed in a Desert.

Two hundred and ninety days is the present African transcontinental automobile record. It was established on May 26th, when Lieutenant Graetz, of the Prussian army, reached Serenje, Rhodesia, practically completing his journey from Dar-es-Salaam, German East Africa, whence he departed on August 10th last. When last heard from, the lieutenant had just succeeded in crossing an arid desert in order to accomplish which, he had been forced to eke out his supply of cooling water with a ration of cold tea, reserved for his own consumption and that of his party. According to the meager despatch which heralds his arrival at his journey's end, a full month of the period which has elapsed since he was reported, was consumed while the expedition was marooned in the desert owing to a gasolene famine. He was obliged to send a native guide to Serenje for more fuel. The car employed for the trip was of special construction, its most noticeable features being its enormous wheels and tires. The fuel tankage was sufficient to supply the 45 horsepower motor for 600 average miles. The party consisted of the lieutenant, a machinist and a native servant.

Improving Jacob's Ladder and Mowry Hill.

"Iacob's Ladder," and Mowry Hill, the Berkshire twin terrors of automobilists, are soon to be reduced to the quiet dignity of ordinary and unobtrusive hills. finally having been raised by automobile clubs or donated by hotel keepers, a contractor has been engaged to alter the fameas hills which lie between Springfield and Pittsfield, Mass. Last Friday, the 5th inst., the work began, the roadway is being widened by dynamiting the rocks which are on either side; other rocks are being dug away, and the roadbed will be regraveled and drained, and ditches filled up. It is thought that the work can be done in two weeks, after which the road will be safe for tourists.

BIG QUESTIONS IN LITTLE COURTS

Curious Rulings by a Larchmont Justice— Novel Point of Law Raised in Proceedings at Jamaica.

Despite the fact that there is no speed limit in Larchmont, N. Y., an automobilist has been fined \$25 for exceeding it. Just how this remarkable judicial decision was reached, will be determined by a higher court to which an appeal has been taken.

The point was raised when J. R. Johnson, Jr., who had been arrested and charged with exceeding the speed limit, was arraigned before Justice of the Peace O. Ernst, which latter, when not in the judicial ermine dons the spotless white jacket and apron of a suburban dentist, for such he is. At the trial, Johnson's counsel, Mr. Olvany, who is the attorney for the Association of Motor Car Owners-of which association the prisoner is a member—requested a copy of the township ordinance regulating the speed limit of automobiles. The court admitted that there was no such ordinance in existance. All this time the prisoner stood charged with "exceeding the speed limit over a marked course in the village of Larchmont,"

The defendant's attorney then moved for his client's discharge and delicately intimated that it would be rather difficult to break a law which did not exist. "Overruled," said the court.

As there was no court stenographer, the defendant furnished one who qualified and was sworn in; then the case proceeded. The evidence showed that a constable timed the automobile in question over a course which he admitted he had not measured, and therefore was not legally qualified to give evidence as to its length.

"I object to constable's testimony," said defendant. "Overruled," said the court.

The court then permitted the constable to be represented by private counsel, against the objection of the defense, who pointed out that such counsel had no legal standing and should not rightfully be permitted to cross examine. Regardless of citation from higher courts and the law in general, every objection was overruled and exception taken by the defense for the purpose of appealing the case, which appeal will be taken immediately.

The fine was \$25, which was paid under protest at the time. The Association of Motor Car Owners is going to make this a test case, as it is asserted the practice of justices of the peace in townships and villages of New York State in arresting and finding automobilists without any justification or legal status is becoming a serious menace to the automobile public.

Another case in which the New York motor vehicle law is involved, came up last week in the court of Special Sessions of Jamaica, L. I. Harry Chandler, a chaufeur employed by X. P. Huddy—the New York lawyer who is conducting the Johnston case in New Jersey, which is to test the constitutionality of the Frelinghuysen laws—raised a novel point when his case was called. Chandler filed a demurrer in which he contended that the court had no jurisdiction in disposing of his case. He had been arrested and charged with having violated the speed limit provision of the State motor vehicle law.

In his demurrer Chandler asked the court to dismiss the complaint against him on the ground that there is no State law regulating the speed limit for motor vehicles, for the violation of which he was on trial. He contended that the magistrate has no power to conduct a preliminary hearing for the purpose of holding the defendant for the Court of Special Sessions. He also declares that no section of the law can be repealed or altered unless a repeal section is included. He says that in 1902 a law was passed making it unlawful to operate automobiles at a speed greater than eight miles an hour in the city limits and 20 miles an hour outside the city.

In May, 1903, a new law was passed, but the Penal Code was not referred to and no special mention made to repeal any specific section. In 1904 another act was passed, but again the code was not referred to. Chandler also says that under the charter the Court of Special Sessions can deal with cases only where the fine would be \$50 or less, and that it has no jurisdiction in the case of a misdemeanor, where a larger fine can be imposed. The case was adjourned until June 16 in order to give the District Attorney time to look up the law on the matter.

New Jersey to Improve Bergen Roads.

Great improvement, some of it much needed, is to be made in the roads of Bergen county, New Jersey. The State road department has recently agreed to pay its share for the rehabilitation of the Paterson plank road, and last week the State road commissioner, Colonel Frederick Gilkyson, approved the Fort Lee Hill road, where automobile accident after accident has occurred. A stone wall interferes with the view on a bad turn and the State improvement ideas contemplate changing this and reducing the grade, as well as purchasing the gore where the bad turn is, thus making a good road out of what now is a death trap.

The State Department last week also approved plans for Haworth's drive, thus connecting the old Schrallemburg road to Westwood, Aetna and other places. One of the difficulties with Bergen county roads is that they all run north and south, and none of them east and west. This the commission intends to rectify so that one will not have to go to Jersey City to get across the county or to Hackensack on the further north side of the county.

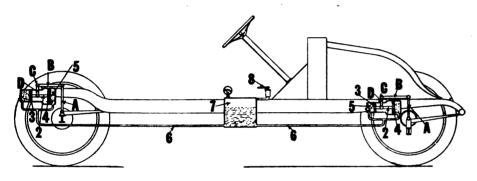

HYDRAULIC SUSPENSION SYSTEM

Radical Idea Applied in Device for Adjustment to Road Conditions—Control of Supports at Operator's Will.

Probably every one who has at any time considered the methods of suspension employed in motor cars has longed for a system by which it would be possible to alter the relative strength of the support to conform to existing road conditions. Were this possible, a car might be driven over rough and smooth roads with equal oscillation, by merely altering the adjustment of the supporting system. Another feature which is readily recognized as desirable is the corelation of the supports for the front and rear ends of the vehicle such that the rocking of the chassis from end to end

part of the system must be accompanied by a very slight corresponding movement in each of the other elements, subject, however, to the compressibility of the air in the main receiver.

In action, when a wheel strikes an obstacle in the road and the axle is raised, the movement is communicated through the linkage above described to the pistons, 3 and 4. The movement on the direct plunge of the chassis is such that the compression movement set up in the cylinders takes place in the larger of the two, and is partly counteracted by the displacement of the liquid contents of the group into the smaller cylinder. The capacity of this member being relatively small, however, a certain amount of liquid is driven back through the piping into the central reservoir. The increase in pressure thus developed, is, of course, imparted to each of the other sets of pistons and cylinders, all four of which are exactly alike.

would be obviated. Both of these points are covered, theoretically at least, in a recent invention which has been patented in France by Louis Renault. It is a hydraulic system, in which all four supports of the chassis are controlled from a central reservoir in which the pressure may be varied at the will of the operator.

The method of arranging the organs of the system will be seen from the accompanying illustration in which A is a link attached to the axle and connecting with a rocker arm, B, which oscillates about a pivot point, C, on the frame. The rocker is really a sort of bell-crank lever, having a second arm, D, which is connected at its lower extremity with a piston rod, 2. This member serves as a connecting medium between two differential pistons, 3 and 4, which are free to move in the cylinders, 5, which also are fixed to the frame. The cylinders are piped through the leads, 6-6, to the central reservoir, 7, which is equipped with a pressure gauge and a pressure pump, 8.

The system is partially filled with some suitable liquid when in use, the level being such that the cylinders, and piping are filled, while a portion of the central reservoir is left free for the pneumatic head on which the balance and cushioning action of the arrangement depends. By this means, the pressures throughout the system are equalized, while any piston movement in one

When the wheel has crossed the obstruction and the axle tends to resume its normal position with relation to the chassis, the differential effect again comes into play to check the rebound, since in order to fill the space behind the larger piston a relatively great amount of liquid must be supplied, and because a certain portion of this must be driven out of the smaller cylinder by its piston. In this connection, it is seen that by regulating the flow through the cylinder ports, any desired amount of piston retardation may be effected. The relative resiliency of the system, naturally depends upon the air pressure in the central reservoir which, as it is regulable, may be altered to suit the conditions of the highway, and in a manner at once simple and conve-

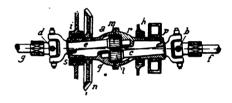

With the elimination of all springs in favor of compressed air, a gain is secured in resiliency, with a corresponding loss of the uncertainty attendant on the performance of all the mechanism involving the use of springs. The idea is decidedly appealing, especially since it provides for a degree of harmony between the supports of the front and rear ends of the machine which is entirely lacking from the suspensions in ordinary use. It is so very radical, however, that considerable demonstration of its properties will doubtless be required before it can be accepted by the public.

DIFFERENTIAL MINUS THE HOLER

New Adaptation of the Spur Gear Principle
—Simple Method for Securing the
Balancing Relation.

So common have the two most familiar types of differential gearing become, that there is a tendency to assume that possibilities in the line of a suitable balance gear for automobile use have been exhausted with the confirmation of the bevel and spur gear patterns. That such is not the case, however, is shown by the development of a new adaptation of the spur gear principle, which has lately been introduced abroad, and which is interesting for this reason, if for no other.

By the use of stub shafts which are slightly inclined instead of being parallel to the axle as is generally the case, the use of an idler has been dispensed with and the balancing relation secured by means of

two plain spur pinions on the ends of the shafts. In order to secure this simplification, however, the designer has been forced to employ two sets of universal joints in order to correct for the disalignment of the stub shafts. But by throwing the centers of the joints into the center line of the axle, the amount of joint motion has been reduced to a minimum.

The method of arrangement is illustrated in the accompanying drawings, from which it will be seen that the differential housing, a, encases the two stub shafts, c and e, which are connected to the driving axles proper at g and f, through the universal joints, b and d. The two pinions, m, l, furnish the compensating connection for the group.

Motion is supplied through the usual bevel gear, n, the turning moment actually transmitted evidently being proportional to the radius of gyration of the pinions about the center of the housing. The group is supported on ball bearings at h and i, while the brake drum is shown at p.

The system, which has been designed by M. G. Coccoti, is especially adaptible to light and low powered vehicles, and is particularly meritorious in regard to its small number of parts and their simple construction. As to its working efficiency, there would seem to be some question as to whether the gain secured by dispensing with the usual number of pinions is not more than counteracted by loss through motion in the universal joints.

GROWTH OF MOTOR CAB SERVICE

Its Popularity in British Cities—The Mistake of Over-Powered Vehicles Pointed Out by a French Observer.

Leading the United States by a year and more in its adoption of the taximeter for motor vehicle use, and so of the taximeter cab, an amount of business has been built up in England which, even at the present time is amazingly large, notwithstanding the rapid increase in the employment of similar vehicles here. Nearly 1,000 taxicabs are now in use in London alone, and others have been ordered, while in the other larger cities of England a constantly increasing number of such vehicles is being put into service.

"It is only two years since the cab drivers were masters of the London streets," remarks Yves Guédon in La France Automobile. "They levied toll according to their own good pleasure, and the Englishmen, who have no love for argument paid them, grumblingly.

"But the times have indeed changed since then. The 'taxi-auto' has arrived and has modified profoundly the habits of the men of affairs of the English metropolis. The automobile fiacres—taxicabs, as the English have christened them—indicate exactly the amount which is to be paid, eliminating all exaggeration on the part of the chauffeur. The tariff is higher, but thanks to their speed, the taxicab trips become frequently less dear than those taken in cabs, and the Englishman is so chary of his time that for him this represents considerable money, which adds largely to their value.

"Under such circumstances the 'taxiautos' rapidly became popularized in the English metropolis and now the red Renaults and the blue Unics are as familiar in London as in Paris.

"The first serious enterprise in the way of London motor cab service, dates back some 15 months. It is that of the General Motorcab Co., which is directed by the administrators of one of the great Parisian companies. Up to the first of last November it possessed 506 Renault taxicabs, precisely similar to the Parisian type."

There are now in London no less than eight taxicab companies, and still another is in process of formation, as he explains. These are: The General Motorcab Co., United Motorcab Co., Metropolitan Motorcab Co., F. I. A. T. Motorcab Co., Express Motorcab Co., London Motorcab Co., Carlton Garage, and the London Improved Cab Co. On the first of April, last, there were 958 taxi-automobiles in service on the London streets, divided among 12 different marks, as follows: 8-9 horsepower Renault, 643; 12-14 Darracq, 50; 14-16 Ballot. 17; 14-16 Rational, 12; 12-14 Argyle. 12; 10-12 Marples, 5; 10-12 Simplex, 4; 10-12 Humber, 2;

14-16 Thames, 1. Of these, the Renault, Marples and Simplex vehicles are equipped with two-cylinder motors, the Unic and Humbers with three-cylinder motors, and the remainder with motors of the four-cylinder pattern. Within some months the number will be increased by 500 new Renault machines which have been ordered already.

"The taxi-autos have not been slow in scattering over the United Kingdom as well," continues the above authority. "It should be remembered that besides London, England possesses innumerable cities and resorts, frequented from one year's end to another with a select population among which the automobile cabs have every opportunity of thriving.

"There are already 33 at Brighton; 22 at Liverpool, where one new company has just been established within a few days; 12 at Eastbourne, 6 at Bradford, 4 at Portsmouth, where there will be no less than 50 within a few weeks; 4 at Birmingham, 3 at Chester, 2 at Edinburgh, and 1 at Nottingham. In all these centers the companies have only just organized, with a minimum number of vehicles in service, but these will be augmented sensibly little by little. . . .

"The tariffs, though high enough, often are inferior to those which have been applied wrongfully and persistently by the 'cabbies.' In London, for instance, the rates begin at 8 pence (16 cents) for the first mile, with 2 pence (4 cents) for each succeeding quarter mile, and 2 pence for each 21/2 minutes or fraction thereof when the cab it standing. At Edinburgh the tariff is 1 shilling (24 cents) for all trips of less than a mile or of a duration of 10 minutes, and 2 pence for each addition of a quarter of a mile. At Eastbourne the charge for the first mile is similarly 1 shilling, with $6\frac{1}{2}$ pence (13 cents) for each succeeding half mile, and a similar amount for each 71/2 minutes' delay. In other localities an attempt has been made to adopt the tariff of the horse-drawn vehicles, but these systems have not been in service a sufficient length of time to permit of judging successfully their monetary results.

"In London where the taximeters have already had 15 months service, the exploitation is developing profitably, even beyond the expectations of its promoters. When the first company, the General Motorcab Co., was created in 1906, the probable daily receipts were estimated at \$9. In March, 1907, with only 45 machines, the average receipts had increased already to \$10 and They have remained somewhere around these two figures, and even increased during the four months of the London 'season,' which lasts from May to the end of July, to \$14 and \$16 a day. Adding that fuel and tires are cheap in England. the rapid extension of taxicab service among our neighbors across the Channel will not be surprising. There are fraudulent practices among the chauffeurs, to be sure, but they are not of sufficient importance to hinder the extension of the service.

"After Paris, London, Berlin and New York, have known the taxi-autos and have exploited them, as the public approves of their services which are beginning to be active in the affairs of the business man and, as in the century in which we live, time is becoming more precious than ever, the taxi-autos will not delay in spreading to all the large settlements and their environs.

"The experience of Paris has not been of much profit to the taxicab enterprises of London. In Paris, a city where traction is very poor, we already have made the mistake of employing machines with 10 to 15 horsepower motors of 2 and 4 cylinders, when the single cylinder motors of the 8 horsepower De Dion-Bouton type would have sufficed. In London the mistake is being continued and even aggravated. Motors of 6 horsepower would be sufficient in the ideal city with level roads, wide and well kept. Yet everywhere, even on the cabs of French manufacture, which are in the majority over those of English construction, they have installed motors of 10, 12, 14 and even 16 horsepower, of 2, 3 and 4 cylinders, making them necessarily more heavy, more costly in the matter of fuel consumption and mechanical upkeep as well as tires.

"When therefore, will our contractors of Paris and London settle upon the monocylindric motor of somewhere about 8 horsepower, which alone will assure economy in their service?"

Originality in Compression Release.

An ingenious application of the principle of the automatic inlet valve has been utilized in the reverse sense in a pet cock intended to be used for starting purposes, and recently introduced on the foreign market. Entirely supplementary to the hand-actuated cock which is employed to release the compression when swinging over the motor prior to starting, is a spring retained valve, which is adjusted to release at a predetermined pressure. At the same time this valve always is sealed with respect to the effects of suction. In consequence, though the required compression release is obtained at the point in the cycle where it is necessary, the suction stroke is carried out without any weakening of the charge due to the admission of air through the pet cock, such as occurs with the ordinary type of plain cock, or with some methods of pressure release by means of the exhaust valves, in which the latter are held open during the entire cycle.

By adjusting the spring it is possible to secure the release at any point desired, thus ensuring sufficient compression to guarantee an effective starting impulse without creating too great a drag on the starting crank. At the same time, the fact that the piston invariably inducts charges of normal constituency makes easy starting an assured fact, regardless of speed of cranking.

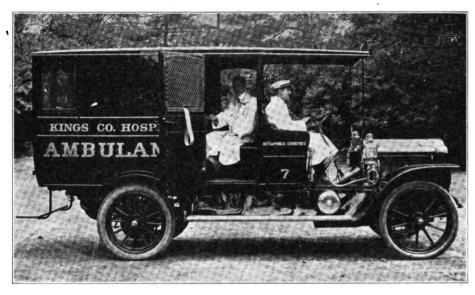

IDEAL AMBULANCE CONDITIONS

Ease and Protection for the Sufferer in New Automobile Type—Larger Capacity for Relief Service.

That the automobile is the best vehicle for hospital ambulance work is generally conceded, and although there are many and varied types of the automobile ambulance in operation quite the latest development in of rubber tires for fire department work, is the fact that they do not cut the hose as engines, trucks, etc., arriving late at the scene of any fire, drive over the lines that have been laid.

Nebraskan Owners Multiplying Fast.

Automobile agents in the State of Nebraska are dispensing machines at the average rate of ten a day, judging from the report of the Secretary of State in the matter of new licenses taken out during the

AUTOMOBILE AMBULANCE OF KINGS COUNTY (N. Y.) HOSPITAL

this direction is the vehicle that has just been constructed for the Kings County (N. Y.) Hospital, by the White company, Cleveland. As shown in the accompanying cuts a departure has been made by having a side door entrance for the surgeon, where he may sit at the head of the patient instead of at the foot, as in most ambulances. The advantage of this arrangement may be readily realized. The crowning feature of this new ambulance, however, is its great size, and the double-deck arrangement of the cots, which is so well worked out that any one of them may be folded out of the way and yet in extreme cases it would be able to convey six or even more persons to the hospital at one time. The value of this feature in large communities where at times the ambulance is in prequent requisition is obvious. Both the top and the bottom cots are on rollers, so that they may be moved without any jar to the patient.

Rubber Tires for Fire Department.

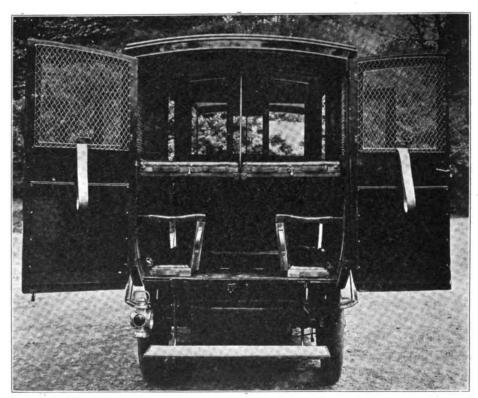

For the Fire Department of New York City, the Diamond Rubber Co. received in May, an order for 14,000 pounds of solid rubber tires. To this order, 12,000 pounds additional were added on June 10, making a total of 26,000 pounds of rubber the Diamond company is to furnish for the fire department's equipment for the coming year. The tires are of the internal wire and side wire type, and cover a great variety of sizes. A strong argument for the use

WHEEL DIAMETER AND TRACTION

Tests Showing Astonishing Gain in Favor of the High Wheel—Requirements of Farm Vehicles Defined.

It is commonly understood, in accordance with the accepted theory on the matter, that the tractive effort required to draw a given load at a stated speed over a certain stretch of highway decreases as the diameter of the wheels is increased. But that the difference may amount to as much as a 21 per cent. reduction in the power requirement where 28 and 55 inch rear wheels are compared, with front wheels of correspondingly smaller preportions, is not generally appreciated. Yet such is the case. as was proved by a series of experiments carried out at the Columbia (Mo.) Agricultural Experiment station. The tests were applied to an ordinary farm wagon, and apply directly to animal drawn vehicles intended for farm work. The points made in relation to wheel diameters, however, are of general interest to the motor vehicle designer, while certain other of the observations are instructive as suggesting the requirements of motor vehicles destined to find a place in the extensive field of agricultural machinery.

According to a summary of Bulletin No.

INTERIOR VIEW SHOWING DOUBLE DECKED ARRANGEMENT OF COTS

month of May. The total receipts from this source during the month amounted to exactly \$354.20, and as the individual fee is \$1, the average is fairly easy to compute.

52, of the institution mentioned, the draft required in each case, was determined by means of a Giddings self-recording dynamometer. The net load, which was uniform

throughout the tests, was 2,000 pounds. Tests were carried out with three sets of wheels, all having tires 6 inches wide. Those known as the standard were of 44 inch diameter in front and 55 inches in the rear; the medium wheels were 36 and 40 inches in diameter, respectively, while the low wheels were 24 and 28 inches in diameter, respectively.

The general conclusions reached were: That for the same load, wagons with wheels of standard height drew lighter, or in other words, required less tractive effort, than those with lower wheels. The difference in favor of the standard wheels was greater on road surfaces in bad condition than on good road surfaces, and it was also observed that low wheels cut deeper ruts than those of standard height. That for most purposes wagons with low wheels are more convenient than those of standard height, particularly since wagons with broad tires and wheels of the standard dimensions are more cumbersome and require a greater amount of room in turning.

Diminishing the height of wheel from 44 to 36 inches in front and 55 to 40 inches in the rear, did not increase the draft in as great a proportion as it increased the convenience of loading and unloading the ordinary farm freight. Diminishing the height of wheels below 30 inches front and 40 inches rear, increases the draft in greater proportion than is gained in convenience.

In regard to the relative length of the front and rear axles, it was observed that while increasing the length of the rear axle so that the front and rear wheels would not run in the same track did not increase the draft on good roads, that effect was produced on bad roads, sod, and cultivated ground. The inconvenience of the long rear axle, the necessity of using wider gates, and the necessity of employing greater care in driving them than when driving wagons with equal length axles, was held to count against that method of construction. Hence the conclusion that: "The best form of farm wagon is one with axles of equal length, broad tires and wheels 30 to 36 inches high in front and 40 to 44 inches behind.

"As an average of all the tests made on gravel roads," concludes the summary, "it is found that the high wheels draw 2.1 per cent. lighter than the medium ones, and 21.2 per cent. lighter than the low ones, the medium wheels draw 18.8 per cent. lighter than the low ones."

Taximeters on Horse-Drawn Cabs.

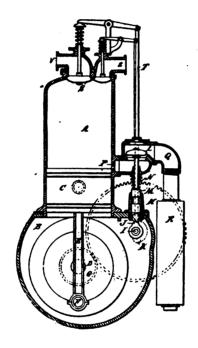

Hoping to regain at least a portion of the patronage which once was theirs, New York cabmen who are members of the cabdrivers' union, have installed taximeters on their horse drawn vehicles. Incidentally the traffic rates have been reduced so that passengers riding but half a mile will not be required to pay for a mile, as formerly was the rule. The half mile rate is 25 cents.

THE MOTOR WORLD

OLDS INVENTS SIX CYCLE MOTOR

Wall Port, Exhaust and Scavenging Valve Embodied in Patent—One Impulse Secured for Every Six Strokes.

Two-cycle and four-cycle motors abound, but the principle of the six-stroke cycle of operations is practically unknown, save in the laboratories of a few investigators who are working toward the improvement of the internal combustion motor. That any going or well known manufacturer was interested in the subject did not become generally known until last week, when there was is-

sued a patent covering the principle to "Ransom E. Olds and Horace T. Thomas, Lansing, Mich., assignors to Reo Motor Car Co., Lansing, Mich., a corporation of Michigan."

The principle involved is that of the ordinary four-cycle motor, supplemented by a scavenging cycle involving the introduction and expulsion of a charge of pure air at the end of every combustion stroke, for the purpose of freeing the cylinder of the products of combustion, and cooling it. As the scavenging operation requires two complete strokes, and the operation of the motor otherwise is practically the same as in the most common form of engine applied to automobile use, the complete cycle of operations requires an interval of five strokes between impulses, or six strokes to every impulse. It is from this sequence of operations that the name six-cycle is de-

The construction outlined in the patent specifications differs from that of the ordinary motor only in having a supplementary exhaust port at the side of the cylinder, opposite the end of piston travel, which is guarded by a mechanically operated valve,

opening outward, and in the use of a valve gear so timed, that the large valve in the cylinder head, which replaces the ordinary exhaust valve, shall be opened during the exhaust stroke, and held open for the two complete strokes following, so that the scavenging charge may be drawn in and expelled without interference due to compression or "wire-drawing." The claims allowed by the Patent Office embody practically these features, and no others are covered by them.

The accompanying illustration suffices to explain the arrangement. At the end of the working stroke, the piston, C. uncovers the exhaust port, P, in the cylinder wall, and at the same instant the valve, L. is opened mechanically, releasing the waste gases to the manifold and muffler, Q-F. On the return, or properly, the exhaust stroke, the cylinder contents, which are at practically atmospheric pressure, are evacuated through the valve, S, also mechanically operated. The next down and up strokes of the piston are devoted to the scavenging action, with which purpose, the valve, S, is held open, permitting air to be drawn in through the port, V, and subsequently expelled. The other organs are substantially regular in form.

Practical Text Book on Lubrication.

Various ingenious methods of instructing drivers in the art of properly caring for the machines under their control have been designed by enterprising sales managers, but perhaps none is equal in merit to that recently put into effect by a British manufacturer as covering the requirements of sane and successful lubrication. The operations incident to this have been divided into four groups, covering operations which should be performed daily, those which may be carried out at weekly intervals, those which are of semi-monthly frequency, and those which have to be gone through once or twice a year. A series of photographs have been prepared, illustrating graphically the operations in each of these groups, and the series is being embodied in a forthcoming issue of the usual instruction book. The brevity and force of instructions so propounded reflects great credit on its originator and is of particular interest locally because the maker in question has instituted a competition for chauffeurs driving his cars, in which the decision rests wholly with the persistance and success with which lubrication is carried out.

Wear in Joints Requires Attention.

Wear in the joints of propeller shafts should be looked after with scrupulous care. Replacements should be made wherever adjustment is impossible, and the working parts kept in as close working order as possible always. There is more action in these parts than generally is supposed, and the least amount of play produces a continual knocking which is very destructive in its tendencies.

TIRE INFLATION AND ITS EFFECTS

Relation of Pressure to Tractive Energy
Shown in Tests—Their Bearing on
the Heating of Tires.

Motorists in general have come to appreciate the importance of following the advice of the respective tire makers in the matter of inflation pressures, merely because it is understood that the tires wear longer under certain prescribed conditions than otherwise. That the tractive effort required to propel the vehicle, and so the speed which it develops under any gear, road surface or grade conditions may be affected by this same factor, however, is not generally appreciated. In fact the entire question of inflation pressures is none too well understood even by engineers, while the average user is quite in the dark as to the real influence which it may have both on the performance of the vehicle and on the life of the tire, except in the one important particular of ease of riding, on which observation alone suffices to inform him.

For this reason a series of tests covering this subject which have been made recently by Alex. Churchward, the well known electrical engineer, are of particular interest. These experiments which served to determine the relative amounts of energy consumed by the car under test with the tires inflated to different degrees of pressure, were carried out with an electric vehicle which was run upon a dynamometer so constructed that all four wheels were driven. The power delivered at the driving wheels was absorbed by a dynamo geared to the wheels of the dynamometer, and arrangements were made whereby observations might be made of the power consumed.

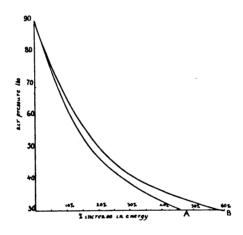

Accurate determinations were made as to the power losses in the vehicle motor and the transmission mechanism, so that the results here presented give the net variations in power due to the differences in tire pressure alone, and independent of all other considerations. The total weight of the machine under test was 2,100 pounds. The wheels were shod with 30 by 3½ inch tires, and the normal air pressure for the tires was 60 pounds. In carrying out the test the air pressure was varied from 30 to 90 pounds, the pressures being kept uniform on all four tires.

The results show a very marked increase in the tractive energy required to maintain any given speed, the minimum requirement being at 90 pounds pressure. With the energy required at 90 pounds as a basis, therefore, the accompanying curve was developed showing the relative increases of energy as the pressure was diminished. The curve, A, was determined on the basis of an average speed of 10 miles per hour, while the curve, B, was plotted from results of trials

which were made at 19 miles per hour, average speed.

From the curves, it will be seen that some 11 per cent. more energy was required to propel the vehicle at 10 miles an hour with the tires inflated to 60 pounds than when the pressure was raised to 90, while when the vehicle was being driven at 19 miles per hour, the increase amounted to a little over 13 per cent. Similarly, with 30 pounds tire pressure, the increases in energy consumed were, respectively, 47 and 60 per cent.

These results have an important bearing on a more or less heated controversy which has been aroused in England recently as a result of one of S. F. Edge's exploits when he drove a Napier car over a measured quarter mile on the Brooklands motordrome several times, with different tire pressures. His conclusion was that practically the same speed could be attained with the tires inflated to only 45 pounds as when they were

inflated to 100 pounds. Later he voiced the opinion that with the tires inflated to a high degree, the wheels were kept off the ground a considerable portion of the time, the rapid succession of sharp impacts resulting, causing bursts and rapid wear. With lower inflation pressures, he asserted that longer tire life was to be expected, provided only that the tire was so constructed that it could stand a relatively great amount of flexure without suffering from internal friction.

Following this pronouncement, a British tire concern has issued a new table of inflation pressures, advocating much lower degrees of inflation than had been their custom, while considerable discussion was aroused in defense of the time-honored theory that hard pumped tires must be "faster" than those subjected to lower degrees of inflation. It should be observed also that recent experiments made in England with a medium powered gasolene car in successive hill climbing trials under varied conditions of tire inflation have furnished an apparent confirmation of the Edge experiments, but under the modified conditions of the grade and a lower rate of speed.

Closely bearing on the subject of the energy requirement of the vehicle, is the question of heating of the tires. Of this, Mr.

Churchward states that he has found the heating to be influenced to a great extent by the chord of the tread, or the length of tread in contact with the ground.

"The longer the chord of tread with a given tire," he says, "the greater the amount of energy consumed—therefore, the hotter the tire will get. This is due to the greater flexing and kneading of the side walls and tread of the tire as it comes in contact with the ground."

With regard to the Brooklands demonstration that a large tire does not slow down a racing car, he says:

"I found from tests that it does not take more energy to drive a vehicle with a large tire and a lower air pressure, provided the chord of tread is approximately the same in both cars. Therefore it does not seem to me that the size of tire and air pressure in same would influence the speed much.

"As the percentage of energy consumed by the tires in a racing car is small compared with that due to windage, it is in the small powered car we find that the tires influence the speed and mileage. Also the type of tire used will have in many cases a direct influence, as at 15 to 20 miles per hour the wind resistance is small, but the tire loss great."

Neglect of the Fan Unwise.

Very many drivers seem to think that the fan on a water cooled car is of little importance. That this idea of the utility of the fan is generally held, is proven by the number of cars on which the fan is out of order. Usually its inactivity is due to a broken belt which, though but a few minutes would be required to make all necessary repairs, is allowed to remain broken until, for lack of something else to do. some one will make the simple repair. But the fan serves an important purpose, and should be kept in condition. Now that the hot weather is here, all devices which work to keep the cylinders cool should be required to do their full duty. If this fact is kept in mind the efficiency of the power plant will be increased.

Smoke Symptoms of Cylinder Lubrication.

Smoke as a test for thoroughness of cylinder lubrication is a popular, though by no means conclusive form of evidence on which many drivers are prone to rely. It should be borne in mind, however, that the mere fact that the exhaust is smoky does not indicate that the lubrication is complete, or rather excessive in all the cylinders. If the smoke issues from the discharge pipe of the muffler in a steady and practically continuous stream, this is the case. But if it comes in intermittent puffs, it may be taken as proof that only one compartment of the crank case is flooded, the other or others, being starved. Such a condition may indicate different rates of flow in the various feeds, or a total cessation in one or another. At all events it reveals a condition which will bear close scrutiny.

MAKING A "CONSISTENCY" RUN

Century a Day for a Century of Days the Schedule—Practical Demonstration of Motor Car Reliability.

A century a day for a century of days is the ambitious program now being carried out by a Premier car in an effort to demonstrate the ability of the modern motor car to perform a consistent day's work day after day continuously. The car was started on its 10,000 miles trip on Monday, 1st inst., at Indianapolis, when it was set in motion at the Soldier's monument by Chief of Police Metgzer. The first day's trip was east

Branch, has been practically idle with the exception of one or two automobile races that have been held upon it.

If the plans of the Elkwood Park Automobile Association, which was formed last week by several Long Branch cottagers, mature, the Elkwood Park track will be the scene of several race meets this summer, the first of which will occur on July 4th. Mayor Charles C. McFadden, of Long Branch, is president of the association; M. Robert Guggenheim is vice-president and William D. Anderson is treasurer. Thomas Francis Moore, the New York press agent, who has been jobless since the Briarcliff Trophy race, is to exploit the venture in the role of secretary. On the board of directors are Harry Payne Whitney, Fred

PREMIER CAR SCHEDULED TO RUN 10,000 MILES IN 100 DAYS

over the National road, where it met the Glidden Premier pathfinder, which was on its way back from laying out the route for the annual tour.

Since its initial trip the car has made its daily century in and around Indianapolis without mechanical mishaps and escaping even the puncture of a tire. On the 14th inst. its base of operations was transferred to Chicago, which city it reached at 2 p. m. on that day. Its odometer showed at that time a record of 1,519 miles. As at Indianapolis, a different route will be selected for each day's trip and a full complement of passengers will be carried. Buffalo, Philadelphia, Boston, New York and other cities will be included in the list of centers from which series of centuries will be run, and it is intended to make the test over every sort of American road. The century of centuries is scheduled to be completed on September 8th.

Automobile Track for Long Branch.

After a vacation of several years, Long Branch, N. J. is to spring into the limelight again as an automobile racing center. Since horse racing was abolished in New Jersey, the mile track at Elkwood Park, near Long Lewisohn, W. E. D. Stokes, P. J. Casey, Walter Lewisohn and Martin H. Vogel.

It is stated that the new association will repair the grandstand and that additional banking will be added to the track. It is the intention to hold race meets as often as possible and as long as the seashore resorters remain interested. The program for the first meet on July 4th includes a 100 miles endurance race, a 50 miles event for amateur drivers, 5 and 10 miles events for stock cars and time trials at one and two miles. Several fast cars already have been entered.

Running Apology for Raising Dust.

No small interest was aroused at a gymkhana contest in England recently by the appearance of one of the cars which bore upon the front of its dash board and running the full length, a sign bearing the inscription: "Sorry for the dust, which we raise but do not make." The upper half of the sign was hinged lengthwise and made to fold over the lower part ordinarily, but by a simple movement, the driver was able to raise it, displaying the apologetic legend to offended pedestrians and others to avert any possible misplacing of blame.

"AROUND THE WORLD" IN A DAY

Picturesque Automobile Fete Serves Benevolence in Montclair—Foreign Capitals

Amid New Jersey Hills.

Montclair's nurses' fund of the Society of New England Women, the gymnasium fund of the Pilgrim's Congregational Church and the Young Men's Christian Association were enriched jointly by more than \$2,000 realized at the "automobile trip around the world," held there on Saturday last, 13th inst. Although not new the unique idea met with popular favor with the New Jersey villagers. Nearly 150 cars were required in carrying the passengers from one city to another.

"Grand Central Station" was represented at the church, and when the first "train" pulled out nearly 1,000 people were in waiting. The committee ran the cars on short schedule, but even then they could not accommodate the crowds and a subway crush at Grand Central Station, New York City, on any afternoon at 5.10 was mild in comparison.

From "Grand Central Station" the passengers were conveyed to "Pekin," thus putting to shame all around the world records. From "Pekin" the route led to "Madrid." taking a jump back to "Yokohoma," then a side step to "Berlin" and finally to "Constantinople." The various residences which represented these cities were decorated characteristically, and provided with booths at which the passengers could purchase souvenirs brought direct from the foreign cities.

At "Yokohoma" the guest of honor was Kokokichi Midzuno, the Japanese Consul-General at New York, and his wife and two children in native costume. At "Pekin" there were a number of native Chinese, picturesquely attired, and at the other cities the scenes were effective by reason of the gay costumes and picturesque decorations. The proceeds go to the charities mentioned.

Brattleboro Club Elects Officers.

At its annual meeting held last week the Brattleboro (Vt.) Automobile Club elected the following officers: President, Charles T. Harris; vice-presidents; Charles W. Dunham and Ferris R. Vaughan; secretary-treasurer, Edwin B. Whitney; directors, William V. Vinton, John B. Manley and Charles A. Smith.

Nebraskans Organize Club at Lincoln.

The Lincoln Automobile Club has been organized in the Nebraskan city of that name with these officers: President, Dr. W. L. Dayton; first vice-president, Dr. W. Davis; second vice-president, Walton G. Roberts; secretary-treasurer, George Holmes; directors, Ernest Ames, F. C. Fiske, and Irving Chapin.

OHIO "AUTOMOBILE LAW" IN FORCE

Full Text of Its Provisions—Badges for Chauffeurs—The Two-Thirds of the Road Requirement.

Ohio's new law, designated by one of its provisions the "Automobile Law." went into effect on June 11th. In many respects it is identical with the New York law. It provides for registration in the office of the Secretary of State of all motor vehicles owned and operated in the State, except motorcycles, motor trucks or drays used exclusively for commercial purposes, road rollers, traction engines, fire engines, police patrol wagons and ambulances. It recognizes the term "chauffeur" which it defines as meaning any person operating a motor vehicle for hire or as the employe of an owner, and it requires the registration of such persons and the wearing of a badge showing the registration number. The registration fees are fixed at \$5 for gasolene vehicles, and \$3 for electrics. The chauffeur's license fee is \$2.

Speed is limited to 8 miles an hour in the business and closely built up sections of municipalities; 15 miles in other portions of such municipalities, and 20 miles elsewhere in the State. Local authorities are prohibited from making any speed regulations, but may define what are the business and closely built up portions of their respective municipalities.

The penalties provided for violation of provisions of the law consist almost wholly of fines, increased for second and subsequent offenses. The fines range from \$25 to \$300. Where the penalty of imprisonment is provided it is alternative with the fine, and in no case is an offender to suffer both forms of punishment, except for the display of a borrowed or fictitious number subsequent to a first conviction for such an offense. Suspension for a period of not less than one year nor more than two years is the extreme penalty provided for chaufeurs in case of a second or subsequent conviction.

In its other provisions the law is along the general lines of those enactments in other States, such as New York and Connecticut, which are regarded favorably by automobilists. The one extraordinary feature in it is that which requires that "all persons riding on horseback, or on a bicycle, tricycle, tandem bicycle, locomobile, automobile. or motor vehicle, shall, on meeting carriages or vehicles of any description, keep to the right so as to leave two-thirds of the road free." The full text of the law follows:

Section 1—That the term "motor vehicle" as used in this act, except where otherwise expressly provided, shall include all vehicles propelled by any power other than muscular power, except motor bicycles, motorcycles, motor trucks or drays used exclusively for

commercial purposes, road rollers, traction engines, fire engines. police patrol wagons, ambulances and such vehicles as run only upon rails or tracks.

Sec. 2—The term "local authorities" shall

Sec. 2—The term "local authorities" shall include all officers of counties, cities, villages or towns, as well as all boards, committees and other public officials of such counties, cities, villages or towns.

counties, cities, villages or towns.

Sec. 3—The term "chauffeur" shall mean any person operating a motor vehicle for hire, or as the employe of the owner there-

Sec. 4—The term "State" as used in this act, except where otherwise expressly provided, shall include the territories and the federal districts of the United States.

sec. 5—The term "owner of" or "person hereafter acquiring" shall include any person renting a motor vehicle or the exclusive use thereof, under a lease or otherwise, for a period greater than thirty days.

Sec. 6—Every owner of a motor vehicle or vehicles, which shall be operated or driven upon the public roads or highways of this State, shall annually for each motor vehicle owned or acquired, except as herein otherwise provided, cause to be filed by mail or otherwise, upon the payment of a registration fee of five dollars for such gasolene or steam motor vehicle, and a registration fee of three dollars for each electric motor vehicle, in the office of the Secretary of State, an application for registration, containing:

A brief description of the vehicle to be registered, including the name of the manufacturer, the manufacturer's number of the motor vehicle, if number there be, the character of the motor power, and the amount of such motor power stated in figures of horsepower.

The name and address of the owner of such motor vehicle, and the name of the county of the State in which he resides.

But any person to whom an annual 1908 license has been issued by any municipality of this State prior to the time when this act shall take effect, shall be exempt from the provisions of sections 6, 7, 8, 9, 10 and 11 of this act up to and until January 1, 1909

Sec. 7-Upon the filing in the office of the Secretary of State of an application as hereinbefore provided, the Secretary of State or his duly authorized agent shall assign to such motor vehicle as described in such application a distinctive number, and shall issue to the owner of such motor vehicle, as it is described in the application filed, a certificate of registration, which certificate shall be in the form of a card, which may be carried in the pocket and which certificate shall contain the distinctive number so assigned to such motor vehicle, the name and the address of the owner, a brief description of such motor vehicle, stating the name of the manufacturer, the manufacturer's number, if number there be, the character of the motor power, and the amount of such motor power stated in figures of horsepower.

Sec. 8—Upon the receipt of an application for registration of a motor vehicle as hereinbefore provided the Secretary of State shall thereupon file such application in his office and register such motor vehicle, with the name and address of the owner thereof, and the facts stated in the application, in a book or index to be kept for the purpose, under the distinctive number and identification mark assigned to such motor vehicle by the Secretary of State, and issue to the applicant a certificate as hereinbefore provided. The original book or index in which the motor vehicles are registered as hereinbefore provided shall be kept in the office of the Secretary of State, and shall be open to the inspection of any person during reason-

able business hours. An exact, full and accurate list of registered motor vehicles and their owners shall be furnished by the Secretary of State to the clerk of every county in the State, and such lists shall be kept as public records, in books to be furnished by the Secretary of State, in the office of such county clerk, and the Secretary of State shall further furnish to the county clerk of each county, once each month, copies of the additional applications for registration received, which shall be entered by the county clerk on the list kept by him as hereinbefore provided.

Sec. 9—That every motor vehicle, registered in accordance with the provisions of this act, shall have the distinctive number and registration mark assigned to it by the Secretary of State and furnished by the Secretary of State, in accordance with the provisions of section 10 hereof, as hereinbefore provided, displayed on the front and rear of such motor vehicle, as an identification mark, securely fastened, so as not to swing.

Sec. 10—That such distinctive number as an identification mark shall consist of a blue placard, as the background, upon the face of which shall appear the distinctive number assigned to such motor vehicle as hereinbefore provided, in white Arabic numerals, such numerals to be not less that four inches long, nor each stroke less that one-half inch in width, such number to be followed on the placard by the initial or abbreviation of the name of this State in white letters, each letter to be at least two inches in height, and each stroke to be at least one-half an inch in width.

Sec. 11—That in the case of a manufacturer or dealer in motor vehicles such manufacturer or dealer shall make applications for registration in the same manner as hereinbefore provided, of each gasolene, steam, electric or other make of motor vehicle manufactured or dealt in by such manufacturer or dealer, whereupon, upon the payment of a registration fee of ten dollars (\$10.00) there shall be assigned to such style or type of motor vehicle a distinctive number as an identification mark, which shall be carried and displayed by every motor vehicle of such style or type registered in the same manner as hereinbefore provided, while such vehicle is being operated on the public highway, and until such vehicle shall be sold or let for hire, and there shall be issued to such manufacturer or dealer a certificate of registration as hereinbefore provided for each gasolene, steam, electric or other make of motor vehicle, and as many certified copies thereof as may be desired. upon the payment of a fee of two dollars

(\$2.00) for each such copy.

Sec. 12—Every motor vehicle operated and driven upon the public roads or highways of this State shall be provided with adequate brakes sufficient to control the vehicle at all times and a suitable and adequate bell, horn or other device for signaling, and shall during the period from thirty minutes after sunset to thirty minutes before sunrise display three white lights, two on the front and one on the rear of each motor vehicle, the rays of which rear lamp shall shine upon and illuminate each and every part of the aforesaid distinctive number borne upon that part of the motor vehicle, the light of which front lamps shall be visible at least two hundred feet in the direction in which said motor vehicle is proceeding, and every motor vehicle shall also display, in addition to the foregoing, a red light on the rear thereof.

Sec. 13—The provisions of the foregoing sections shall not apply to motor vehicles owned by non-residents of this State, provided that the owners thereof shall have complied with the provisions of the law of

the State of their residence in regard to motor vehicles, and shall comply with such law while operating and driving a motor vehicle upon the public roads or highways of this State: Provided, however, that the foregoing sections of this act are substantially in force as law in the State of the residence of the owner of such motor vehicle, otherwise all provisions of this act shall

apply.
Sec. 14—No person shall operate a motor vehicle on the public roads or highways of this State at a rate of speed greater than is reasonable or proper, having regard to width, traffic and the use of the highway and the general and usual rules of the road or so as to endanger the property or life or limb of any person, or the safety of any

property. Sec. 15--In no event shall any automobile, motorcycle or other motor vehicle be operated at a greater rate of speed than 8 miles an hour in the business and closely built up portions of any municipality in this State, nor more than 15 miles an hour in the other portions of such municipalities, nor more than 20 miles an hour outside of such municipalities, which rates of speed shall not be diminished nor prohibited by any ordinance, rule or regulation of any municipality, board or other public authority, but municipalities may by ordinance define what are the business and closely built up portions of such municipalities.

Sec. 16—Any operator of a motor vehicle, upon meeting or overtaking a horse-drawn vehicle, or person on horseback, shall slow down and stop said motor vehicle when signaled so to do and shall remain in such condition until said horse-drawn vehicle or person on horseback shall have safely passed.

Provided, however, that such signal to stop shall be given in good faith and under the necessity of the circumstances, and only so often and for such length of time as shall be required to permit said vehicles to safely pass, whether approaching from the front or the rear. In case of accident to a person or property on the public highway, due to the operation thereon of a motor vehicle, the person operating such vehicle shall stop, and, upon request of a person injured, or any person present, give such person his name and address, and, if not the owner, the name and address of such owner.

Eec. 17—Every person hereafter desiring to operate a motor vehicle as a chauffeur shall file in the office of the Secretary of State, upon the payment of the registration fee of two dollars (\$2.00) an application for registration which shall state: The name and address of the applicant, and that he is competent to operate a motor vehicle; the trade name and the kind of motor power of the vehicles or vehicle he is competent to operate; and whether or not the applicant operate: and whether or not the applicant has ever been previously convicted of a violation of any of the provisions of this act, giving the date and place of such conviction, and the provisions of this act violated, if any.

Sec. 18—Upon receipt of such an application, the Secretary of State shall thereupon file the same in his office in a book or in

file the same in his office in a book or in-dex, which shall be kept in the same manner as the book or index for the registration of motor vehicles, as hereinbefore provided, and the Secretary of State shall forward a list of such registered chauffeurs, and such additions thereto, as shall be made from time to time, to the county clerk of every county in the State, in the same manner as hereinbefore provided in the case of registered motor vehicles, and such lists shall be kept as public records in the county clerk's office in every county in the State.

Sec. 19—The Secretary of State shall

forthwith upon the registration of such chauffeur, as hereinbefore provided, issue

to such chauffeur a badge of aluminum or other suitable metal which shall be oval in form and the greater diameter of which shall not be more than two inches; and such badge shall have stamped thereon the words, "Registered Chauffeur No. ...; State of Ohio,;" with the registration number inserted thereon, which badge shall thereafter be worn by such chauffeur, fastened upon his clothing in a conspicuous place at all times, while he is operating a motor vehicle upon the public roads or highways of this State. Sec. 20—No chauffeur having registered

as hereinbefore provided shall voluntarily permit any other person to wear his badge, nor shall any person while operating a motor vehicle upon the public roads or highways of this State wear any chauffeur's badge, belonging to another person, ficti-tiously representing himself to be a regis-

tered chauffeur.

Sec. 21-No person shall operate a motor vehicle as a chauffeur on the public roads or highways of this State, subsequently to thirty days after this act takes effect, unless such person shall have complied in all respects with the requirements of this section; provided, however, that a mon-resident chauffeur, who has registered under the provisions of the law of the State of his residence, which are substantially similar to the provisions of this section, shall be ex-empt from registration under this section; provided, however, that he wear a badge assigned to him in the State of his residence in the same manner as hereinbefore pro-

vided, and comply with all the other provisions of this section.

Sec. 22—No chauffeur or other person shall drive or operate or cause to be driven or operated, any motor vehicle upon any public road or highway of this State in the absence of the owner or such motor vehicle,

without such owner's consent.

Sec. 23—No local authority shall have any power to make any ordinance. by-law or resolution regulating the speed of motor, provided, however, that local authorities may set aside for a given time a specified public highway for speed tests or speed.

may set aside for a given time a specified public highway for speed tests or races. Sec. 24—The violations of sections 6, 9, 11 and 12 of this act shall be punishable by a fine not exceeding twenty-five dollars (\$25) for a first offense, by a fine not less than twenty-five dollars (\$25) and not exceeding fifty dollars (\$50) for a second offense, and by a fine not less than fifty dollars (\$50), and not more than one hundred dollars not more than one hundred dollars (\$100) or imprisonment for not more than thirty days for a third and subsequent offense.

Sec. 25—Any violation of section 14, 15 and 16 of this act shall be deemed prima facie evidence of a misdemeanor punishable by a fine not exceeding twenty-five dollars (\$25) for a first offense, and by a fine not less than twenty-five dollars (\$25) and not exceeding fifty dollars (\$50) for a offense, and by a fine not less than fifty dollars (\$50) and not more than one hundred dollars (\$100) or imprisonment for not more than thirty days for a third offense, and for any subsequent offense, within one year, imprisonment for not less than ten days, nor more than thirty days.

Sec. 26—Any person operating or driving a motor vehicle on the highways of this State, which shall display thereon a distinctive number or identification mark belonging to any other motor vehicle or one which is fictitious, shall be deemed guilty of a mis-demeanor, which shall be punishable by a fine of twenty-five dollars (\$25) for a first offense and for any subsequent offense by a fine not less than fifty dollars (\$50) or more than three hundred dollars (\$300) or imprisonment for sixty days or both.

Sec. 27—Any violation of section 17, of

this act, by a person not registered as a chauffeur, as hereinbefore provided, shall be punishable by a fine of not more than firty dollars (\$50) or the suspension of the right to apply for registration as a chauffeur, un-der this act, for one year or both, and for a subsequent or second offense by a fine of not more than one hundred dollars (\$100) and in addition the suspension of the right to apply for registration as a chauffeur for a time not less than one year or more than two years.

Sec. 28--Any violation of sections 19, 20 or 21 of this act, by a chauffeur, registered as hereinbefore provided, shall be punishable by a fine not exceeding fifty dollars (\$50), or by the suspension of the right to operate a motor vehicle as a chauffeur under the provisions of this act for a period of six months or both, and for a second or subsequent offense by a fine of not less than fifty dollars (\$50) and not exceeding one hundred dollars (\$100) and in addition the suspension of the right to operate a motor vehicle as a registered chauffeur un-der the provisions of this act for one year, and for such further time as shall be fixed

by the trial court.

Sec. 29—Any violation of section 14. 15 and 16 of this act by a registered chauffeur shall be a misdemeanor and punishable as provided in section 25 and in addition thereto a suspension of the right to operate a motor vehicle as a registered chauffeur as hereinbefore provided for thirty days for a second offense and for a period of not less than one year for a third offense, in which case the registration of such chauffeurs shall

become null and void.

Sec. 30—Any person violating any of the provisions of section 22 of this act shall be deemed guilty of a misdemeanor, and upon conviction shall be fined a sum not exceeding two hundred dollars (\$200) or imprisonment for a period not exceeding six (6) months or both in the discretion of the

Sec. 31—Upon the conviction of any person for a violation of any of the provisions of this act, the magistrate or other judicial officer, before whom the proceedings are held shall immediately certify the facts of the case and the character of the punish-ment to the Secretary of State, who shall enter the same, in the case of an owner or chauffeur, either in the indices of registered motor vehicles or registered chauffeurs, as the case may be, opposite the name of the person convicted, as in the case of any other person, in an index of offenders to be kept for such purpose, in alphabetical order. The Secretary of State shall then send notice of the conviction and the punishment of all such persons, whether owners, chauffeurs, or other persons to the county clerk of every county in the State, who shall enter the same upon the lists of registered mo-tor vehicles or registered chauffeurs, as the case may be, which are kept by him as hereinbefore provided, or upon a list of other offenders which he shall maintain in his office as a public record in the same manner as the registered lists of motor vehicles or chauffeurs as hereinbefore provided for. and shall furnish copies of such lists to the magistrates or other judicial officers of his county by whom the offenses against the

provisions of this act are punishable.

Sec. 32—In case any person shall be taken into custody because of any violation of any of the provisions of this act, he shall forthwith be taken before any magistrate or juswith be taken before any magistrate or justice of the peace in any city or village or county, and be entitled to an immediate hearing: and if such hearing cannot be held shall be released from custody on giving his personal undertaking to appear in answer for such violation at such time or place as shall then

SECURING RESPECT FOR THE LAW

Efficacy of Mild Measures for Enforcement
Practically Exemplified — Motorists
Heed Timely Suggestions.

Two examples of what may be effected in securing observation of the law by motorists through appealing to their sense of right are afforded by the town of Middleboro and the city of Newton, both in Massachusetts. The town authorities of Middleboro and the local automobile club co-operated in a plan for placing along the roads through the town banners offering fair play to the passing automobilists and asking rair play in return. The basis of this reciprocity is a speed limit of 12 miles an hour through the town, and the plan has been found to work well.

Placing the responsibility of reasonable driving upon the automobilists themselves is a plan which has been followed in many instances with gratifying success by Chief of Police Mitchell of Newton. Letters to individual, and perhaps unintentional orfenders, and numerous signs setting forth the speed regulations and location of dangerous corners, have been used with excellent results by the police of that city.

"A large majority of automobilists who drive over the streets throughout Newton are careful drivers," Chief Mitchell says. "It is but a small number who flagrantly disregard the written and unwritten laws of the road and cause trouble. Frequently reports are made by patrolmen and civilians that machines are run at excessive speed through different streets, around dangerous corners or on the boulevard roadway reserved for horse-drawn vehicles.

"We make it a point to secure the numbers of such machines. We then write a brief letter to the owners, setting forth the day, time and place that their machines were run in alleged violation of the law, and notifying them that they must exercise care in driving within the limits of this city.

"This plan was adopted three years ago. Some weeks but a few letters will be sent out, while in other weeks a dozen or more are mailed. The plan has been very successful in stopping individual alleged offenders. It will be followed during the present season," said Chief Mitchell. In addition to the signs along various frequented thoroughfares setting forth the speed regulations, there have been erected signs warning automobilists to slow down to low speed."

Toll Roads Must be Open to Automobiles.

Pennsylvania automobilists won a big victory at Wilkes-Barre on Monday last, 15th inst, when Judge Halsey in a lengthy opinion declared that no toll road company has a right to keep automobiles off its

road. The toll roads around Wilkes-Barre have been a bone of contention between automobilists and the companies operating them for several years and the case which brought the opinion was watched with more than ordinary interest.

The case in point was that of W. W. Scranton, of Scranton, against the Laurel Run Turnpike Co., which owns the beautiful boulevard driveway over the mountains from Wilkes-Barre to Bear Creek, and which, ever since the road was opened, has been closed to automobiles. Scranton decided to make a test case and be brought suit after being refused admittance.

Judge Halsey decides that under the act of 1874 an automobile must be included in the general designation as a carriage of pleasure, under whatever name it may go, and as such is to be admitted on all public highways, a point which automobilists have been endeavoring to make many judges see for several years.

Judge Halsey refuses to concur with the allegation of the company that the law fixes no lawful and reasonable toll for automobilles and orders that the road shall be opened to them at once. If all the toll companies in Pennsylvania respect the ruling of Judge Halsey, motoring in the hilly section, in which these toll roads abound, will become a pleasure instead of a hardship and distances between points of interest will be ntaterially shortened.

New Massachusetts Court for Motorists.

Among the latest acts of the Massachusetts legislature, now adjourned, was the passage on the 10th inst. of the automobile bill which originated with the Safe Roads Association of that State. Under the new law the State highway commission becomes both an executive and a judicial body, for it not only is obliged to execute the laws, but it may go ahead and investigate cases and summon witnesses the same as any court. There is also provided in the new bill a section for the employment of investigators to delve into accident cases in the same way the Safe Roads Association does. There is a provision that requires the commission to revoke the license of an operator of a car who figures in serious accident, and who upon conviction, appeals, Unless the person is acquitted in the upper court, or the commission on investigating the facts finds there are mitigating circumstances, no new license shall be issued for at least 60 days after conviction, and the commission has the power to withhold it even then.

Lost License Pads May be Replaced.

Under a ruling made last week by J. B. R. Smith, Commissioner of Motor Vehicles for New Jersey, a motorist may obtain duplicate official license pads for his machine in case the originals are lost, by making affidavit to that effect. The price will be 75 cents for a single pad, or \$1.50 for a set of two.

be indicated, secured by a deposit of a sum equal to the maximum fine for the offense with which he is charged, or in lieu thereof, in case the person taken into custody is the owner, by leaving the motor vehicle, and in case the person taken into custody is not the owner by leaving the motor vehicle with a written consent given at the time by the owner, who must be present, with such judicial officer; or in any case, if such judicial officer is not accessible, shall be forthwith released from custody by giving his name and address to the person making the arrest and depositing with such arresting officer a sum equal to the maximum fine for the offense for which such arrest is made, or in lieu thereof, in case the person arrested is the owner by leaving the motor vehicle, and in case the person is not the owner, by leaving the motor vehicle with a written consent given at the time by the owner, who must be present; provided, that in such case the officer making the arrest shall give a receipt in writing for such sum or vehicle deposited and notify such persons to appear before the most accessible magistrate naming him, specifying the date, place and the hour.

In case such undertaking with security or deposit shall not be made by an owner or other person taken into custody, the provisions of law in reference to bail in cases of misdemeanors shall apply.

Sec. 33—The revenues derived from the registration fees provided for herein shall be applied by the Secretary of State toward defraying the expenses incident to the carrying out and enforcement of the provisions of this act, and any surplus thereof shall be paid by the Secretary of State into the treasury, monthly. All actions for injury to the person or property caused by the negligence of the owner of any automobile included within the provisions of this act, may be brought by the party injured against the owner of such automobile in the county wherein such injured party resides. In case such action is begun, a summons against any defendant or defendants shall be issued to the sheriff of any county within the State of Ohio, wherein such defendant or defendants, as in other civil actions, any law to the contrary providing for the service of summons in civil actions notwithstanding.

Sec. 34—All moneys coming into the treasury, pursuant to this section, shall be there maintained as a separate fund for the improvement, maintenance and repair of the public roads and highways of this State, and shall be apportioned as the State highway fund is apportioned by law.

Sec. 35—This act shall be known as the "Automobile Law," and shall take effect and be in force from and after thirty days after its approval by the Governor.

after its approval by the Governor.
Sec. 36—That section 3490 of the Revised Statutes be amended so as to read as fol-

Sec. 3490—All persons driving carriages or vehicles of any description on any public turnpike, road or highway of this State. shall, on meeting carriages or vehicles of any description keep to the right so as to leave half of the road free, and all persons riding on horseback, or on bicycle, tricycle, tandem bicycle, locomobile, automobile, or motor vehicle, shall, on meeting carriages or vehicles of any description, keep to the right so as to leave two-thirds of the road free

Sec. 37—That section 3490 approved April 23, 1904, and an act entitled, "An act to compel owners and operators of motor vehicles to register with the Secretary of State," passed April 2, 1906, be and the same are hereby repealed.

To Sum Up-

Solar Motor Lamps are superior to those of other manufacture for the following reasons:

(1) The internal method of screw assembling insures a perfectly smooth exterior. (2) All parts are interchangeable. (3) They have fewer parts. (4) Are more simple in construction. (5) Less solder is used. (6) The brass has more "body"—they are heavier and more durable. (7) They are better in design. (8) Special B & L Solar short focus Mangin Mirrors are used and each lamp is tested for accuracy of focus. The highest efficiency as regards lighting is assured.

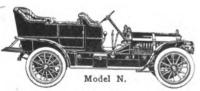

No detail is overlooked in the construction of Solar Lamps. The Solar Nameplate is a positive guarantee to the user that he has the best in lighting equipment.

Weed Chains Will Answer the "Skid" Question to Your Entire Satisfaction

They positively do not injure the roads. The pressure upon the tire forces the chain into the rubber, not into the road. The "creeping" of the chain prevents injury to the tires. From the lightest runabout to the heaviest limousine WEED CHAINS are necessary equipment. Skidding is dangerous, both to car and occupants. It is impossible to skid with WEED CHAINS. Write for Bulletin.

WEED CHAIN TIRE GRIP COMPANY
35 Moore Street, New York

The Week's Patents.

884,562. Tire Construction. Frederick A. Bragg, Springfield, Mass., assignor, by direct and mesne asignments, of one half to Daniel J. Brown, Springfield, Mass. Filed Sept. 10, 1906. Serial No. 333,975.

1. In a tire construction, a series of layers composing the tread portion, said layers including a rubber core and quilted by threads saturated with a rubber solution.

884,731. Electric Igniting Device. Roy E. Hardy, New York, N. Y. Filed Dec. 18, 1905. Serial No. 292,178.

1. In an electric igniting device the combination of an induction coil, a casing of non-conducting material inclosing said coil and projecting at one end beyond the same, exterior binding screws carried by the casing in electrical connection with the terminals of the primary of the coil, a sparking plug having an exterior metallic shell forming one electrode, a second electrode insulated therein, a flanged head integral with the shell detachably engaging and closing the projecting end of the casing and forming an air space between it and the induction coil, and electrical connections connecting the exterior shell and the insulated electrode with the terminals of the secondary within the air space in the casing.

884,752. Center Drive Axle and Wheel. John McGeorge and Harold McGeorge, Cleveland, Ohio. Filed March 5, 1907. Serial No. 360,703.

1. In a driving mechanism for vehicles, the combination of a pair of wheels, a driving shaft, and clutch mechanism interposed between the driving shaft and each wheel shaft, substantially as specified.

884,794. Protecting Casing for Tires. Lorwin N. Cates, St. Louis, Mo. Filed June 15, 1907. Serial No. 379,188.

A tire casing composed of series of pairs of sections hinged together along the outer edge or tread of the wheel, tongues projecting from the sections on opposite sides of the hinge-line, and sockets formed in the contiguous sections for receiving said tongues and thus interlocking with the sections carrying said tongues, substantially as set forth.

884,846. Gasolene Turbine Motor. James F. Orebaugh and Charles W. Connett, Madison, Ind.; said Connett assignor to said Orebaugh. Filed May 25, 1907. Serial No. 375.675.

1. In a motor, the combination of a casing, a partition secured to said casing, a series of explosion chambers fixed to said casing, compressing plungers mounted to reciprocate in the explosion chambers, a spring seated piston head mounted in the explosion chambers, means for moving the plungers inward to compress the charge, a shaft mounted in the casing, and a series of bucketed rotors keyed to the shaft.

884,853. Internal Combustion Engine. Carlton R. Radcliff, New York, N. Y., assignor to International Patent Corporation, Jersey City, N. J., a Corporation of South Dakota. Filed July 26, 1906. Serial No. 327,808.

1. In an internal combustion engine, the combination with a plurality of cylinders, of a gas receiving and compressing space in each cylinder and having an inlet and a port near the lower end thereof to allow exhaust of the products of combustion in case of back fire. a combustion chamber in each cylinder and having an exhaust, and a com-

municating passage between the gas receiving space of one cylinder and the combustion chamber of another cylinder.

884,882. Overland Steam Coach. Robert L. Woods, Nashville, Tenn., assignor of one-third to Solomon P. Harris, Nashville, Tenn. Filed March 1, 1906. Serial No. 303,712. Renewed Feb. 13, 1908. Serial No. 415,764.

1. The combination with a vehicle body, of the front and rear trucks, a plurality of sets of wheels pivotally mounted for rotation on the forward truck, and means connecting said wheels whereby the movement of one set of wheels will effect the movement of the other.

884,929. Radiator or Cooler for Motor Road Vehicles. Friedrich J. D. Hullinghorst, London, England. Filed June 24, 1907. Serial No. 380,579.

1. In radiators or coolers, for motor road vehicles having an air propelling fan said radiator being provided with an axis and a main annular chamber, in combination with means providing additional small and large annular chambers concentric with the axis of said fan, and disposed at the back and front of the radiators, with a sechambers, and connected at their outer ends with said large chambers, partitions dividing said large chambers into two compartments and communicating pipes or passages from the said main annular chamber, so that the water to be cooled is caused to flow from the upper compartments of said larger concentric chambers through the upper half of the series of radial tubes to the inner annular chambers, and thence through the lower half of the series of radial tubes into the lower compartments from which it flows into the base of the radiator and circulates about the main annular chamber, as set forth,

884,967. Shock Absorber for Vehicles. William C. Williamson, New York, N. Y. Filed May 10, 1907. Serial No. 372,890.

1. In a shock absorber, in combination, a case, a spring barrel, a spring plate, the edges whereof are supported in said case, and a member held against the body of said plate and transmitting the pressure thereof to said barrel.

885,014. Front Driven Motor Vehicle. Arthur W. Brightmore, Burford, Egham, England. Filed Sept. 27, 1906. Serial No. 336,458.

1. In a motor propelled vehicle of the type referred to, a segmental race and rack on the vehicle under frame, a slider engaging said race and pivoted on the fore-carriage at the "neutral" position, a pinion meshing with the rack and fixed on a spindle carried by the slider, a second spindle connected to the former by a universal joint, a worm wheel on the second spindle, a worm meshing therewith and means for driving the same, substantially as hereinbefore set forth.

885,059. Indicator for Tanks. Julius B. Laursen, Sorkness, N. D. Filed April 11, 1907. Serial No. 367,539.

1. In a device of the class described, a dial receiving member having a central bore terminating at one end in a recess, a rod having threaded extremities rotatably mounted in the bore, a pointer engaging one of the threaded ends of the rod and adapted to rotate in the recess of the member, a float, means co-operative with the latter and the opposite end of the rod to ac-

tuate the same to move the pointer, a crystal mounted on said member above the recess therein, a detachable cap for securing the crystal in position on the member, and a removable stopper carried by the cap.

885,111. Steering Wheel Pivot and Pivot Bearing for Automobiles. Josef Vollmer, Berlin, Germany, assignor to General Electric Company, a Corporation of New York. Filed June 20, 1906. Serial No. 322,592

The combination with a steering wheel pivot, of an axle fork having an upper bearing for the pivot, a removable lower bearing therefor which is divided to permit the removal of the pivot, and means for ad-justing one of said bearings to secure a uniform distribution of the weight upon the bearings.

885.121. Puncture Telltale. Charles A. Winter, New York, N. Y. Filed Aug. 14, 1906. Serial No. 330,592.

1. In a puncture telltale, the combination of a pneumatic wheel tire, an electric circuit closing device comprising a contact carried by the wheel, a part connected with said contact and engaged by the tire, a con-tact mounted on a part stationary with ref-erence to the wheel in the path of the wheelcarried contact, the tire when inflated acting on the part engaged thereby to keep the wheel-carried contact from touching the stationary contact, and means that moves the wheel-carried contact to cause its engagement with the stationary contact when the tire is deflated.

885,181. Automobile Buffer. James H. Sager, Rochester, N. Y. Filed Feb. 21, 1908. Serial No. 417,190.

In an automobile buffer, a horizontal buffer rod, lever means attached to said rod and pivoted to the frame of the automobile and pivoted to the frame of the automobile on an axis in a substantially vertical plane and projecting at an angle to said plane from the pivotal axis to the attachment thereof to said rod, a spring put under stress by movement of the lever around its pivot, and a spring support attached to said automobile and in convenient proximity to said lever.

885,249. Steering Gear for Automobiles. John C. Higdon, St. Louis, Mo. Filed Dec. 4, 1906. Serial No. 346,331.

1. A steering gear for motor vehicles, the front axles of which swivel horizontally, comprising a steering post, arranged for operation in the body of the vehicle, a pinion fixed on the lower end of the steering post, a chain engaging the teeth of the pinion, connections between the ends of the chain and the outer portions of the swiveled axles, and a chain retainer fixed to the vehicle frame and adapted to hold said chain on said pinion.

THE MOTOR WORLD

885,336. Tire Cushion for Vehicles. William E. Garvey, Cleveland, Ohio. Filed June 4, 1907. Serial No. 377,136

1. A vehicle tire consisting of a rubber casing, a core of rope, and a winding there-on of a strand of yarn fitting and filling the rubber casing and forming a cushioning support therefor upon the rope core.

885,493. Horn. Howard W. Lester, Hartford, Conn., assignor to The Post & Lester Company, Hartford, Conn., a Corporation of Connecticut. Filed Nov. 5, 1907. Serial No. 400,752.

A horn consisting of a tapered convolute body with the smaller end of the body at the periphery and the larger end of the body at the center, said larger end having an ovoid perforated head in the plane of the coils, substantially as specified.

885,505. Driving Gear for Automobiles. Henry G. McComb, Detroit, Mich. Filed Jan. 2, 1907. Serial No. 350,441.

1. In combination a power shaft, a plurality of gear wheels fixed thereto, a counter shaft, complementary gear wheels carried thereby and adapted to be thrown into and out of operative connection with said first mentioned gear wheels, a plurality of driving wheel mechanisms, each deriving their power therefrom independently of the other, and a second counter shaft axially in line with the power shaft and adapted to be thrown into clutching engagement there-with to receive from it the power ordinarily transmitted to the first named counter shaft, substantially as described.

885,647. Pneumatic Vehicle Tire. Mary B. Priest, Milwaukee, Wis., assignor to The Priest Tire Company, a Corporation of Wisconsin. Filed May 20, 1907. Serial No. 374,567.

In a pneumatic vehicle tire comprising a one piece tubular casing, having flexible side walls, a flattened split base, and an outer flat tread extension; the combination of a metallic band fitted to the flat tread extension, a pliable annular shoe fitted over the band, metallic clamping rings fitted to the sides of the shoe and said flat tread ex-tension, and securing bolts connecting the

Add the neat, snappy little Brush \$500 Runabout to your stable. Will save its cost in depreciation, tires, etc., in one season and is just as good for 75 per cent. of your work.

BRUSH RUNABOUT COMPANY, Detrole

Nuts That Require Tightening After considerable use the bolts driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

Use Columbia Lock Nuts COLUMBIA NUT & BOLT CO., Inc., Bridgeport, Conn.

Dealers can make quick sales with this machine. The upkeep is very light; has solid rubber tires; goes through deep mud and sand, and elimbs steep hills. Double cylinder, air cooled, 10-12 H. P. It's your loss if you don't get the agency. Write,

"Whitney" Patent Cotter **Detachable Roller Chains**

Made a fine record in the Briarcliff Road Race.

THE WHITNEY MFG. COMPANY, Hartford, Conn.

New York City, May 2, 1908.

Gentlemen—The uniform strength of an automobile driving chain is one of the important requisites in a speed

The "Whitney" Chains which formed a part of the equipment on our three "Stearns" Cars in the recent Briarcliff Stock Car Road Race, showed their superiority by coming through this exceptionally difficult contest without the slightest evidence of the terrific strain which they had undergone. Our "Stearns" Cars made an exceptional showing in this race, and we attribute our success in no small degree to the entire absence of chain trouble.

Our experience in previous contests has taught us that a faulty chain can cause a lot of trouble.

We therefore take this opportunity to express the satisfaction which we feel at the manner in which "Whitney" Chains demonstrated their worth

Yours very truly,

WYCKOFF, CHURCH & PARTRIDGE,

THE WINNING CAR

in most really notable automobile events, is equipped with Harford Tires.

This is a fact that should be most significant to the man who buys tires.

It proves that the men who really know, and who have learned, perhaps by bitter defeat and disappointment, that the best, and the best only, is real economy, recognize in Hartford Tires the highest standard of quality.

¶ The Philadelphia North American, of June 14, speaking editorially of the winning car at Point Breeze track, June 13th, says: "Tire trouble of the slightest kind would have meant defeat, but the Hartford Tires on the machine did their work nobly."

¶And so the story goes—ever and always success on Hartford Tires.

Get them on YOUR car.

Hartford Tires

"The tire with the doubt and the risk left out"

are always the same in quality. All one grade—the best, and the trade marks here reproduced are your guarantee and protection.

Hartford Tires and Hartford Tubes

the world's best for quality, resiliency, durability and satisfaction.

Large Sales

make it possible for us to import THE CELEBRATED BRAMPTON CHAINS from ENGLAND (paying freight and duty), and sell them at the same price at which the several other automobile chains are sold to manufacturers, jobbers, dealers and users.

THE BRAMPTON MOTOR CHAIN

All side plates on both sides on the Brampton Chain are stamped "BRAMPTON."

LARGE SALES and SMALL PROFIT with thousands of satisfied customers is our beat advertisement.

THE BRAMPTON CHAIN is made of helf-hardening Steel; the strongest Chain in the World. All parts polished; fits sprockets (that are properly cut) without friction.

Some of the other chains may look like THE CELEBRATED BRAMPTON CHAIN because some of the other chain makers began to copy the design and shape of the BRAMPTON CHAIN links in 1904. They have improved somewhat on their copied design from time to time until these chains now look more like the BRAMPTON CHAIN than ever before. These chains somewhat resemble the BRAMPTON in appearance, but the manufacturers of such chains have been unable to copy the material-self-hardening steel.

NO CHANGE IN THE BRAMPTON

There has been no change in the design, construction, material or finish of the BRAMPTON MOTOR CHAIN in the past ten years.—"ENUF SED."

PRICE

The price being equal, it's presumable you want the best, and full value for your money. In such cases, the BRAMP-TON FILLS THE BILL, and the prices are the same to manufacturers, jobbers, dealers and consumers as any other chain of equal size—as follows:

CHAINS TO FIT AMERICAN CARS

 1 x 3/4 x 9-16—1 x 1/2 x 5/6—1 x 1/2 x 9-16 roller
 \$1.00 per foot.

 1 x 5/6 x 5/6 roller
 1.17 "

 1 1/4 x 1/2 x 5/6—1 1/4 x 5/6 x 5/6—1 1/4 x 5/6 x 3/4 roller
 1.25 "

 We also carry in stock the BRAMPTON CHAINS to fit Foreign Cars—Mercedes, Panhard, Martini, Fiat, etc.

Your 1908 Car

You can have the new car that you order fitted with the CELEBRATED BRAMPTON CHAIN if you order it that way. No extra cost to either you or the manufacturer. All standard sizes in stock to fit American and Foreign Cars at the same price as the other chains.

SPECIAL CHAINS TO FIT THE INDIAN MOTORCYCLE.

Agents wanted in unoccupied territory. Catalog on request.

Pan-American Automobile Body Polish

Pan-American Polish was awarded the Bronze Medal at the Louisiana Purchase Exposition at St. Louis, 1904. This polish has been carefully prepared for the Automobile trade. It is also applicable to the carriage trade, or can be used on any varnished furniture or woodwork of any kind. It will remove stains, cover scratches: leaves the automobile with its original new lustre, without being sticky or greasy. Furnished in eight-ounce bottles. Guarantéed not to harm the finest varnish. For sale by all Automobile Dealers. Price 60 cents per bottle.

The Miller Automobile Jack

The Miller Automobile Jack is a quick acting, automatic lowering jack, designed especially for automobile use, and is adapted to the factory or garage as well as to be carried as a part of the equipment on motor cars. It is high-grade and one of the finest finished jacks on the market. We guarantee this jack for twelve months. The list price of the Miller Jack, \$3.50 each.

To Sum Up-

Solar Motor Lamps are superior to those of other manufacture for the following reasons:

(1) The internal method of screw assembling insures a perfectly smooth exterior. (2) All parts are interchangeable. (3) They have fewer parts. (4) Are more simple in construction. (5) Less solder is used. (6) The brass has more "body"—they are heavier and more durable. (7) They are better in design. (8) Special B & L Solar short focus Mangin Mirrors are used and each lamp is tested for accuracy of focus. The highest efficiency as regards lighting is assured.

No detail is overlooked in the construction of Solar Lamps. The Solar Nameplate is a positive guarantee to the user that he has the best in lighting equipment.

SECOND SHOW IS IN ABEYANCE

Arrangements Practically Settled, but Final Action Awaits Miles's Return—Manager Reeves Falls Ill.

On his return from a western visit last week, Alfred Reeves, general manager of the American Motor Car Manufacturers' Association, reported that arrangements for the organization's show in Chicago next winter had been "practically settled," which would indicate that Chicago has small prospect of escaping the two-shows situation that has afflicted New York during the past several years.

Reeves stated that according to present plans the show will be housed in the Exposition Building, Forty-third and Halstead streets, which affords 146,000 square feet of space-more than twice as much as is afforded by any other building in either Chicago or New York. It was added that the Association's show committee would go to Chicago early next month to complete the final arrangements; but a statement issued the next day suggests that the second show is not a certainty, by any means, and that nothing further will be done until the return from abroad of S. A. Miles, manager of the established show in the Chicago Coliseum, in which the licensed and the unlicensed manufacturers have dwelt in peace for one week of each of several years.

Miles is expected to arrive almost any day and it may prove that the "second show movement" is but an adroit bit of cleverly planned strategy. Information on the point is, however, not obtainable, as the day after issuing his last statement Reeves was stricken with appendicitis, and to the distress of his many friends, he was forced to undergo an operation. At last accounts, however, he was doing well, and with every prospect of an early recovery.

During his western trip Reeves visited a number of factories and reported that almost without an exception they are operating full time, and that work on the 1909 models is well advanced.

Fire Destroys Shelby Tube Plant.

The plant of the Shelby Steel Tube Co. at Shelby, Ohio, which was the property of the National Tube Co., which in turn is owned by the United States Steel Corporation, was totally destroyed by fire on Thursday night last, 18th inst. As the plant had been shut down for several months, the cause of the fire is a mystery. The flames spread so rapidly that they had consumed the property before the engines summoned from neighboring towns arrived. The loss is estimated to be \$2,000,000.

Court Extends Pope-Toledo Time.

Judge Robert W. Taylor, of the United States Circuit Court for the Ohio district, extended the time for filing creditors' claims against the Pope Motor Car Co. to July 15th, when Irving Belford, as special master, will consider the eligibility of the claimants for sharing in the settlement of the company's affairs. Claims aggregating \$300,000 already have been filed with the special master.

Alexander to Compete with Elyea.

W. D. Alexander, formerly of the Alexander-Elyea Co., Atlanta, Ga., who took over the firm's Jacksonville (Fla.) branch when he and Alexander recently parted company, is preparing to establish a jobbing house of his own in Atlanta in competition with his former partner. Alexander is at present in New York purchasing stock. Elyea, it will be recalled, is now doing business as the Elyea-Austell Co.

Thomas-Detroit is Now Chalmers-Detroit.

The title of the E. R. Thomas Detroit Co. has been changed to Chalmers-Detroit Motor Co., taking its name from its new president. The style of the company's newest product, a four cylinder, 24 horsepower car, listing at \$1,500, similarly will be known as the Chalmers-Detroit.

LAMP MANUFACTURERS TO CONFER

To Get Together in Detroit To-morrow to Correct Abuses—Jobbers' Status Likely to be Defined.

Following the M. A. M. policy of promoting better understanding and to correct the far reaching abuses that have sprung from fictitious list prices and discounts, the lamp manufacturers who are contained within the membership of the Motor and Accessory Manufacturers, Inc., will hold a conference to-morrow at Hotel Pontchartrain, Detroit.

The attitude of the lamp makers respecting discounts differs, however, from that of the M. A. M. tire producing group who were first to engage in such a conference. The lamp men are in favor of increasing the dealer's discount and decreasing that of the jobber, and of more specifically defining the status of the latter. One prominent lamp manufacturer is known to be in favor of allowing the jobber but 10 per cent. more than is given the dealer, the jobbing discount to apply only to those houses that issue a catalog in which is actually listed the goods on which the discount is named. In other words, no catalog, no discount. According to this manufacturer's views, jobbers should be required not to sell at less than dealers' prices. These opinions, of course, reflect the ideas of but one man. What the Detroit conference will do in the matter remains to be seen.

Nally to Manage Lockport's Branch.

C. F. U. Kelly, president of the new Lockport Rubber Co., announced last week that D. B. Nally, the New York representative of the Continental Rubber Works, will join the Lockport company's staff on September 1st next. Nally, who is a big, genial soul with a knack of making friends, will have charge of the branch which the Lockport Rubber Co. will shortly establish in New York City.

In the Retail World.

The Austin Automobile Co. has opened a branch at 1420 Michigan avenue, Chicago. It is in charge of George L. Adams.

The Oldsmobile Co., Spokane, Wash., has leased the premises 107-109 East Sprague avenue, which will be used as a sales room and garage. It is a brick building, 40 by 75 feet.

E. W. Bender has under construction on West Seventh street, Los Angeles, Cal., a modern fireproof garage and repair shop. It is near his present location between Alarado and Lake streets.

W. L. Loos, who for several years has been manager for John T. Bill & Co., at Los Angeles, Cal., is to open an establishment of his own at Oakland. He will handle the Reo cars and the R-S motorcycles.

I. R. Campbell, president of the Campbell Auto Co., which has garages at Albia and Fort Dodge, Ia., has opened one of the most complete automobile establishments in Des Moines, at 309-311 East Walnut street. He will handle Rambler cars.

Burlington, Ia., congratulates itself upon the establishment of the Burlington Auto and Supply Co., which has opened a garage at 309 Front street, to hire out automobiles, deal in supplies and do automobile repairing. Warren Beckwith is manager.

Franklin Martin and T. G. Conway, Jr., of South Orange, N. J., have formed a co-partnership to conduct the Marco Garage in that town. They purpose incorporating as a company. Plans have been approved for a one-story garage, 50x150 feet, at 62 South Orange avenue. It will be built of concrete blocks.

Colonel F. C. Fenner has bought the interest of C. A. Hawkins, of San Francisco, in the White Garage at Los Angeles, Cal., and has become president of the company, which takes over the White agency in that part of the country. Captain H. D. Ryus remains in charge and holds the position of vice-president and manager. The two officers, with C. W. Ryus and Henry Bixby, are trustees.

Nicholas Bechtel, of Cambridge, Mass., has been trying ever since 1906 to get permission from the city authorities to build and maintain a public garage on Harvard street, near Dana, in that portion of the city known as Dana Hill. The aldermen voted down the proposition each year until the present, when they voted, 6 to 5, in favor of granting the privilege. And now Mayor Wardwell interposes a veto.

The Week's Incorporations.

Worcester, Mass.—Macker-Tyler Co., under Massachusetts laws, with \$1,000 capital; to deal in automobiles. Corporators—Melvin A. Macker, Oliver P. Tyler, Frederic T. Sanford.

Niagara Falls, N. Y.—Frontenac Garage Co., under New York laws, with \$10,000 capital; to deal in and repair automobiles.

Corporators—Eugene Cary, Elmer H. Porter, Daniel Burtch, Niagara Falls, N. Y.

Halfmoon, N. Y.—Automobile Co-operative Association of America, The, under New York laws, with \$40,000 capital; to manufacture automobiles and motor boats. Corporators—F. B. Roues. Rutherford, N. J.; William C. Dickerman, and H. H. Williams, New York City.

Dale Reports Good Business Outlook.

According to C. H. Dale, president of the Rubber Goods Mfg. Co., which includes the Hartford, G & J, and Morgan & Wright plants, there has been a sharp improvement in business during the past few weeks, and the outlook is very encouraging. The tire output is larger than it was last year and the only department that shows a large falling off is that furnishing supplies to the railroads. The company's railroad business has a value of \$3,000,000 to \$4,000,000.

"Our business is satisfactory, a decided improvement having taken place in the first weeks of June," says Mr. Dale. "Collections are coming in freely; last week they amounted to about \$1,500,000. In fact money has become almost a glut.

"In view of the cheapness of money I anticipate a marked improvement in general conditions soon. I expect that in August we will see a considerable revival which will be due to the wealth of the country rather than to the probable outcome of the presidential election. The latter of course will have its effect in so far as it is reassuring or not.

"All the plants of the Rubber Goods company are being operated, though not to the limit of last year. I consider the conditions prevailing then as abnormal, however, and in contrast this year's production would be about normal."

· Meteor "Unveils" Its First Product.

The first of the new Meteor four-cylinder cars, the product of the Meteor Motor Car Co., Bettendorf, Iowa, was "unveiled" last week by Ehlers & Duerr, the Davenport (Ia.) agents of the company. The "unveiling" was made quite an event and excited a lot of interest.

Hyde Returns from Visit to Europe.

Arthur H. Hyde, general manager of the Whitlock Coil Pipe Co., Hartford, Conn., returned from Europe this week. He was absent two months during which he combined some business with more pleasure.

Page Begins to Build Runabouts.

The recently incorporated Page Motor Vehicle Co. has commenced operations at its plant, 288 Dyer street. Providence, R. I. It will build a 20 horsepower, four-cylinder runabout.

Blackman Leaves Parish & Bingham.

Charles W. Blackman has resigned as sales manager of the Parish & Bingham Co., Cleveland.

Olds Increasing Facilities.

At present there are more men employed at the Olds Motor Works, at Lansing, Mich., than ever before. According to an authorized statement, there are exactly 375 more men at work than were engaged at the busiest period of 1907, and the number of orders is greater than at any time since the days of the single cylinder runabout.

Several improvements of importance are being made at the factory. One of these is the planking of the half mile track. This track is used for testing purposes and is to be covered with 16-foot plank, two inches thick.' Work is now well under way on this track and when it is completed the Olds Motor Works will have as fine a testing track as there is in the country. Inside the track a base ball diamond has been prepared for the use of the men both in the shop and offices. Several additions are now under way, the largest of these being a new central storehouse. This building, which is now nearly completed, is ninety by one hundred and fifty feet in dimension and is two stories high. Other improvements too, are being pushed rapidly so that there is no delay on 1909 models and the facilities for handling this work are greater than ever

British Trade Shows Continued Decline.

British imports of cars and parts continue to decline. The aggregate importation for the month of May was \$84,605 less than for May, 1907. But 340 cars were imported, of a total value of \$605,640, while the 289 chassis imported were valued at \$531,400. The total value of parts was \$751,-430. The combined total for the month was thus \$1,888,470. A drop in exports also was observable during the month. The 144 cars exported were valued together at \$279,350, while 15 chassis were shipped out of the country, with a combined valuation of \$25.-735. Together with the \$127,550 worth of parts, the total thus amounts to \$432,635. The total exportation for May, 1907, was \$457,905.

Rajah Removes Office to Bloomfield.

On July 1st the Rajah Auto-Supply Co. will remove its office from New York City to Bloomfield, N. J., where the factory is located. The facilities of the plant recently have been considerably enlarged, which will permit of an increased output of the Rajah spark plugs and other specialties.

Brinegar on Annual Eastern Visit.

E. P. Brinegar, of the Pioneer Automobile Co., San Francisco, Pacific Coast agents for the Oldsmobile and Thomas cars. is now in the East. It is in the nature of his annual visit.

Jeffery Starts on Foreign Pleasure Trip.

Thomas B. Jeffery sailed yesterday for an extended trip abroad. Pleasure is the chief purpose of his visit.

APPERSON ADDS A NEW MODEL

Features of Popular Priced Car in Touring or Runabout Form-Increase of Facilities Announced.

Two noteworthy features are embodied in the annual announcement of the Apperson Bros. Automobile Co., both of which are significant of changing times and growing confidence in the strength of the industry. One involves the introduction of "Model O." which is a brand new car, of Apperson build throughout, and listing at \$2,250 with 3 or 4 passenger body, or \$2,400 with 5 passenger touring body. The other statement is to the effect that the manufacturing facilities of the Kokomo factory have been increased to an extent which will make possible an output during the coming year of no less than 1,000 cars.

Model O is a four cylinder machine rated at 30.4 horsepower by the A. L. A. M. formula and built with individually cast cylinders having valves oppositely placed and actuated from cam shafts enclosed within the crank case. The lifters are adjustable for wear and lost motion and the crank case is so arranged that both cam shafts may be withdrawn without disturbing the remainder of the motor. Ignition is by jump spark with storage batteries as the source of primary current, although the high tension magneto equipment will be supplied extra. The carburetter is of origihal design, and has been used by the makers for a number of years.

Transmission is by contracting band clutch and three speed, selective type change gear, a feature of the device being the construction of the gear box, which is built in the form of a solid casting, so arranged that the gears and shafting may be withdrawn without removing a single bolt or nut except those retaining the cover. A further point in its favor is that there are no bolts or nuts inside the case and nothing to work out of adjustment. Needless to say, all bearings are of the ball type. They are noteworthy in that they are of the latest New Departure pattern, however, that is to \$ay, that two rows of balls are employed in each bearing instead of one. The propeller shaft is designed for straight line transmission under normal load.

The more general specifications of the machine include the wheel base, 119 inches; wheels and tires, 34 by 4 inches; springs, semi-elliptical, 40 by 50 inches long, front and rear; clearance, 101/2 to 11 inches under the axles; and brakes, double, internal-external, mounted on the rear wheels. The front axle is drop forged and carries ball mounted steering pivots. The rear axle is of the floating type and is cambred sufficiently so that the rear wheels stand on a "plumb spoke,"

In addition to the new model, the Apper-

son output for the coming year will also include these models which have been built heretofore: "Jack Rabbit;" Model E, 50-55 horsepower, in touring car and 5 passenger runabout styles; Model I, 40-45 horsepower touring car; Model M, 35-40 horsepower, with 3, 4 or 5 passenger bodies; and the 50-55 horsepower 6 cylinder touring car, with 7 passenger body.

Receiver Named for a "Wonder Worker."

On the petition of William Spencer, Charles E. Oelschlager and Frank Kegrize, John L. Burns has been appointed receiver in this jurisdiction for the chemically named CO2 Development Co., of Philadelphia. The defendant concern, together with John E. Carroll, the principal stockholder, was sued for an accounting to all stockholders and for an explanation of the management and development of an invention of Carroll's. The invention related to the use of carbonic acid gas for the generation of motive power for the operation of machinery and vehicles of all descriptions, particularly automobiles and railway cars.

It is charged that Carroll dominated the business of the company, the election of the board of directors and generally ran things to suit himself. It is also charged that while he has maintained a demonstrating apparatus in the company's Philadelphia office, he has repeatedly refused to give proper demonstrations of the value of the invention to proposed investors, and has repeatedly used profane, abusive and offensive language to proposed investors, and as a result of his conduct the company has been attacked by publications in technical, trade and other journals as a fraud and swindle and has been greatly damaged in its reputation and business. Carroll is also charged with having refused to develop the invention or to proceed with any plans for its application to vehicles and machinery.

Chicago Dealers Ask for a Speedway.

The Chicago dealers certainly are not backward in asking for what they want. In a communication to Mayor Busse of that city, Henry Paulman, representing the Chicago Automobile Trade Association, has asked for an automobile speedway on the South Side of that city. In his letter Paulman urges that a street one mile long be designated for the use of the association so that demonstrators of automobiles may show prospective purchasers the power and speed of cars without danger of conflict with the city speed laws. The mayor referred the communication to Commissioner of Streets Hanberg.

Reo Declares a 40 Per Cent Dividend.

The Reo Motor Car Co., Lansing, Mich., has declared another cash dividend of 40 per cent. This is the second dividend of the year, the first of 20 per cent, having been paid on April 18, and makes a total of \$600,-000 paid in dividends, so far this year on a ment has suggested itself as a result of capital stock of \$1,000,000.

PACKARD "THIRTY" FOR 1909

Small Differences Between Latest Model and Its Predecessors-Some Minor Refinements and Their Effects.

"As has been the case during the last few, years, the Packard Motor Car Co., has made only slight alterations in the design in present use in producing the 1909 model, 'Pack-' ard "Thirty," announcement of which was made last week. With one or two exceptions, the differences between the latest: model and its predecessors are not readily observable, but comprise a number of minor refinements such as may be appreciated by those who are intimately acquainted with the machine.

Of the visible indications of this refining process, the most noticeable is the elimination of the small reverse lever, which formerly was employed, in favor of an improved form of single shifting lever, which, though progressively actuated in obtaining the forward speeds, is moved inward in obtaining the reverse. Another new and visible feature is a brace which extends between the two headlight brackets, for purposes of reinforcement. The headlights included in the regular equipment this year, are of Solar make, it should be mentioned incidentally. Still another new feature is the use of a honeycomb radiator instead of the ribbed tubular type employed in the 1908 cars

Improvements pertaining directly to the motor, include the elimination of the idler. gears in the two-to-one mechanism, as a result of which the element of noise is reduced, as well as the number of parts in motion. A centrifugal water pump now is: used, instead of the gear pump, while a special feature of its construction is the hydraulic pressure lubricated, thrust bearing. The crank shaft also has been changed in design at its forward end in such a way that there is no unprotected end protrud-1 ing from the forward part of the case.

As for the running gear, a partial redesign of the steering mechanism has resulted in the placing of the rod connecting' the arm at the base of the steering column; and the knuckles, over, instead of under, the axle as formerly, thus minimizing the jark upon the hands of the driver. It also is to be observed that roller bearings are now! employed in mounting the front wheels. Added to this, a new and improved form of lining is employed in the brake shoes, which is more durable than any yet employed, while a change in the gear reduction from the motor to the ground, makes the latest, type operate in the same ratio as was employed in the 1907 type.

The body design remains much the same as heretofore, except where a minor improvecareful observation.

WHITE WINS

A Partial Summary of Victories, May, 1907-May, 1908

Perfect Score in Harrisburg **Endurance Run**

Tieing with three other cars in the contest of May 5th-6th, 1907. For the result of the "run-off," see below.

Fastest Time in Wilkes-Barre Hill-Climb

Defeating 45 high-powered gasolene cars, in the great contest on Decoration Day, 1907.

Fastest Time in Cleveland Hill-Climb Defeating 40 high-powered gasoline cars.

Fastest Time in California Hill-Climb

Defeating the fastest of its gasoline competitors by nearly two minutes on the $2\frac{7}{8}$ mile hill at Witter.

Perfect Scores in Sealed **Bonnet Contest**

Both White cars entered made perfect scores in this contest conducted by the Automobile Club of America.

Officially Observed Non-stop Run of 1871 Miles

Held under the auspices of the Royal Automobile Club of England and certified by that organization.

Fastest Time of the Season on the Track

One mile in 1:02, ten miles in 12:54, and twenty-five miles in 29:07 at the Santa Rosa Track Meet.

Officially Declared Most Efficient Car

In the South Harting hill-climb, conducted by the Royal Automobile Club, the White won the contest because it developed at the rear wheels a greater percentage of its assigned horsepower than did any other car. The rating assigned to the White was 50 horsepower.

Wins English Dust Trials

Proving officially that it raises less dust than any other car.

Ciean Sweep in the Glidden Tour

Three White entries make three perfect scores.

WRITE FOR LITERATURE

THE WHITE COMPANY, Cleveland, Ohio

NEW YORK CITY, Broadway at 62d St. SAN FRANCISCO, 1460 Market St. PHILADELPHIA, 629-33 N. Broad St. BOSTON, 320 Newbury St. BOSTON, 320 Newbury St. CHICAGO, 240 Michigan Ave.

PITTSBURG, 138-148 Beatty St. CLEVELAND, 407 Rockwell Ave.

Won Hower Trophy

The single White runabout entered in the Glidden Tour defeated a dozen high-priced gasoline runabouts competing for this prize.

Won California Reliability Contest

In the original contest held September 20th, two Whites tied with two gasoline cars. In the "run-off" held November 15th and 16th, both Whites made perfect scores, while both gasoline cars were penalized.

Won Quaker City Endurance Run

In this contest, held January 1st, 2d and 5th, the White vanquished 27 gasoline cars of 23 leading makes, winning the MacDonald & Campbell trophy.

Fastest Time in San Francisco Hill-Climb

Winning the free-for-all, the \$2,500 class and the \$3,500 class.

Fastest Time in the New York **Carnival Hill-Climb**

Making the ascent of Fort George hill in 321/2 seconds, compared with the best gasoline time of 36 seconds; largest entry list of any hill-climb ever held.

New San Francisco-Los Angeles

The White car made the 478-mile mountainous journey in 17 hours and 17 minutes, cutting 56 minutes from the previous

Double Victory in Harrisburg **Endurance Run**

The single White entry was the only touring car to make a perfect score, winning the principal 1908 trophy, the Board of Trade Cup, and also the 1907 prize in a "run-off" with last year's other perfect-score drivers.

Perfect Score in Detroit Endurance Run

Perfect Score in Baltimore Sealed **Mechanism Contest**

Two Perfect Scores in Kansas City **Reliability Run**

NEW YORK, JUNE 25, 1908.

Effect of Automobiles on the Highways.

Nothing can be more offensive to the thinking motorist, just at this time, when public sentiment has become fairly quiescent on the subject of the motor vehicle, than to have the cry raised that the automobile is a destroyer of the public highways. Leaving aside all question as to whether this is actually so or not, the very outcry which is being raised is a confession of the weakness of highway systems, and of the need of improving them to meet present day requirements.

The automobile is an indispensible adjunct to civilization even now. Its use and its indispensibility are fast growing. It is impossible to check its development, or to stifle its use. Why then, is it necessary to proclaim its destructive qualities? Rather it should be said that the roads are becoming insufficient for the demands of modern traffic, in which the automobile is a potent factor and a significant forerunner of other

motor vehicles yet be built, of a huge motor traffic of the future.

The principle involved is self-suggestive when a definition—almost a eulogy of the good road—voiced by Hon. John Bankhead before the United States Senate at its last session, is considered. He said:

"Good roads are avenues of progress, the best proof of intelligence; they aid the social and religious advancement of the people; they increase the value of products; they save time, labor, and money; they are the initial sources of commerce, which swell in great streams, and flow everywhere, distributing the products of our fields, forests, and factories. The highways are the common property of the country, their benefits are shared by all, and they are needed by all; they benefit all, and all should contribute to them."

Although the Senator said nothing about the inequalities of the "contributions" which are imposed, it is a melancholy idea that while we are still struggling to bring a few paltry miles of trunk highway into shape according to the ideals of the day, we find those ideals inadequate to the needs of the day; that when we have finished our good roads, we must turn about and build better ones. But after all it is not a question of building through and through, but of covering and protecting the foundation material with a suitable and durable roof, which is the crucial point. Improvements in that respect, and more thorough and systematic methods of maintaining the public thoroughfares will probably solve the problem for many years to come, if not for all time. In the interim, the automobile is to be regarded as an instrument of enlightenment in this respect rather than as a transgressor, and those who are inclined to disparage it on this account should be silenced before they have reawakened the old, senseless spite against the automobile as a voluntary and aggressive offender.

Speed and Its Bad Influences.

That curious trait of human nature which has been disclosed by the automobile, the overpowering tendency of so very many persons for senseless and unnecessary speed, still remains unexplained. Considering the general subject of transportation methods—and going back but very few years in the consideration—the remembrance is keen to most persons of a day in the not distant past when the main streets of large and important cities were the thoroughfares on which the man of business went to and from

his daily pursuits in a car, drawn by horses, at a speed averaging about four miles an hour. And in that day, there was no great demand for faster time, the call was rather for "more cars."

Cable roads were next introduced and found favor because they furnished a means of travel at a rate of speed more than double that obtained in the horse drawn vehicle. And in turn the cable roads gave way to the trolley cars, which were faster still than their predecessors.

At this period of time men and women had become used to the sensation of what they considered rapid traveling. Often on suburban roads the occupants of trolley cars rode faster than 20 miles an hour, and because of the noise and vibration from the vehicle, it seemed that a high rate of speed had been obtained and human nature was satisfied; there was elation and exhileration in the rapid movement.

Then the automobile came into fairly general use, and soon the daily press contained accounts of arrests for reckless driving, and for speeding within the city limits. From 12, 15 or 20 miles an hour, the accusations took on a more sportive aspect; pleasure seekers were accused of driving their cars at rates of speed varying from 25 to 60 miles per hour, and then the others, the masses, who owned no automobiles, began to wonder what there was about the sensation of rapid traveling that appealed, apparently with irresistible power, to the motorists. The answer to the question has not been given. Why, when on pleasure bent, a car should be driven at a rate of speed that shakes the occupants of it until they have difficulty in maintaining their positions on the seats, why it should be driven at a rate of speed that puts an abnormal strain on the power plant, transmission and, in fact, on all parts, thereby increasing the amount of wear and tear, and decreasing the natural "life" of the vehicle, is beyond the reckoning of normal man, even of those who find their enjoyment in this very practice.

It was but a short time ago that man, going to and from business, was satisfied, maybe perforce, with a rate of travel of four miles an hour, now he requires five times as fast for business purposes and ten times as fast when in the pursuit of pleasure. The tendency is dangerous and should be curbed. The danger lies not alone to the occupants of the speeding car, but to pedestrians and other users of the public highways. The opposition which automobilists have been encountering in legislative

halls, in township boards, and in village offices, largely is due to this fanatical tendency for speed. The bad name which automobilists have in many communities is due to the same cause, and the final freedom from legislative restrictions, from discriminating road taxes and from local ordinances is going to come when the owners of motor cars bring themselves, or are brought to a realization that the pleasure of motoring comes not with the maintenance of a high rate of speed, but rather does it come when one rides at a reasonable pace which permits of the driver and the driven, riding along in a state of physical and mental relaxation which is not possible when it is known that the least unexpected happening may result in death or injuries, and be solely caused by the insatiable desire for insane speed. For the mental strain, so rarely considered, is quite as great as are the physical and mechanical strains.

Contests for Private Owners.

In educational value and in many other respects the contest for the Hagerman trophy, which occurs in St. Louis and vicinity on Saturday next, probably is worth as much as all other similar or nearly similar contests put together. It is a contest restricted to private owners and not, like all others, one monopolized by trade experts. If public performance of the sort is significant, the performance of the private owner should weigh preponderantly with the prospective purchaser who really thinks first and buys afterward.

The Motor World often has urged that more contests of the kind be promoted. In response, some men in the trade have stated that a sufficient number of owners could not be attracted to insure the success of such events. But the fact that there are 25 entrants for the St. Louis contest suggests that the contention is an empty one. Other tradesmen have opposed the idea because they fear that a competing owner may injure the reputation of their cars which is rather "rough" on the cars.

The wonder is that more of the non-trade clubs have not taken the bull by the horns and promoted events for private owners, owning and driving their own cars. It would be in the nature of promoting real sport.

Consistency is a rare jewel. One of the race promoters whose pocketbook apparently was injured by some action of the A.

A. A., and who finds relief for his feelings in an automobile column which he edits, urges that the control of racing be turned over to a party of five men whom he names. one of whom, like himself, nurses a large sore spot. The consistency of the gentleman is rendered gloriously sublime by the fact that for many months he has professed to have been horrified by the discovery, made while standing on his head and gazing at his purse, that the "control" of the A. A. A. is vested in three disinterested men, whose control he well knows is of the most perfunctory character rendered necessary for corporate purposes. Apparently, five men instead of three will undo all the "evil" he has so religiously forced himself to see without the aid of either telescope or magnifying glass.

Now that automobile designers have learned the necessity of employing extremely powerful brakes, it remains to teach the user how to apply them. Under the old order of things no particular "technique" was required in handling the brakes, because even when applied to their full capacity, the effect upon the machine was not immediately evidenced. With the newer types of brake, however, much more skill must be exercised or the entire mechanism of the car will be strained beyond its normal capacity, while the tires will be ruined at an astounding rate. Having developed the perfectly efficient brake, it remains to instruct the driver to use it sparingly.

One of the women of some wealth who induced the spot light to center on her by engaging in automobile competition and who thereby came to be worth her weight in gold to press agents and newspaper photographers, is "dreadfully mad" because the A. A. A. has put up the bars against female racers. She means to try to break down the bars-indeed she does. But probably they will remain in place. Women competitors are entrancing spectacles so long as everything remains lovely. But let one of them be killed or maimed and the outcry and condemnation that rightfully will result speedily will prove the wisdom of the rule that bars them.

Having about passed through that remarkable epidemic which required that every publicity man obtain and circulate photographs of actors, actorines and chorus girls, singly and in groups, taken in

COMING EVENTS

June 24, 25, 26 and 27, Chicago, Ill.—Chicago Motor Club's 1,200 miles reliability run to Dixon, South Bend, Joliet and Chicago.

June 24, 25, 26 and 27, New York and Philadelphia—Monroe County Automobile Association's dual reliability run to Stroudsburg, Pa., and hill climbing contest and carnival at Mount Pocono.

June 27, Minneapolis, Minn.—Minneapolis Automobile Club's annual hill climb.

June 27, Norristown, Pa.—Norristown Automobile Club's hill climbing contest on Skippack hill.

June 30, Rockville, Conn.—Rockville Automobile Club's hill climbing contest on Ned England hill.

July 34, Wildwood, N. J.—Motor Club of Wildwood's annual automobile carnival.

July 4, Pueblo, Col.—State Fair Association's meet at fair grounds track.

July 4, Glens Falls, N. Y.—25 miles stock car race at mile track.

July 4, Baltimore, Md.—Motor Car Racing Association's meet at Pimlico track.

July 4, Long Branch, N. J.—Elkwood Park Automobile Association's meet at Elkwood Park track.

July 4, Cape May, N. J.—Quaker City Motor Club's race meet and carnival.

July 9. Buffalo, N. Y.—Start of American Automobile Association's annual reliability touring contest for the Glidden and Hower trophies.

July 15, St. Paul. Minn.—Automobile Club of St. Paul's meet at Hamline track.

July 15, Huntington, N. Y.—Huntington Automobile Club's carnival and races.

December 31-January 7, New York City—American Motor Car Manufacturers' Association's annual show in Grand Central Palace.

the particular motor car represented by each respective press agent, we beseech that enterprising profession to save us from a further deluge of portraits of the presidential nominees and their wives, children, cousins and aunts. Since the political pot commenced to boil, we have received something less than one hundred protographs of Messrs. Taft and Bryan, not to mention other candidates, seated, standing and otherwise disposed in various automobiles. It has been in the nature of an "embarrassment of riches." Such pictures have lost the charm of novelty and no longer serve any real purpose. It is time for the publicity men to turn their energies and enterprise in other directions.

REAL RACING AT READVILLE MEET

Grant Captures Two Events—De Palma
Puts Oldfield in Eclipse—Christie
Best in Time Trials.

When it is said that H. F. Grant, driving a 45 horsepower Berliet, won most of the prizes at the postponed race meet of the Bay State Automobile Association, held at the Readville track, Boston, on Wednesday of last week, 17th inst., this must not be too literally construed. Grant was the only driver to take two firsts, so evenly were the events contested. The other first prize winners were L. B. Lorimer, Thomas; Stan-

heat. This brought Grant, De Palma and Lorimer together for the 20 miles final, which was a pretty race. Grant nosed his way to the front at the start with De Palma a close second. This order was maintained until the finish, the first named winning by a hundred yards.

There were only two entries in the two miles event for cars of 40 horsepower or less, and Lorimer edged away from Synder, Oldsmobile, early in the race, and lapped him in the 17th mile. The time was 21:56%.

All the crack drivers came together for the first time in the 5 miles free-for-all for runabouts, and it was decided to run this in heats, one in each to qualify and the second in the fastest heat, to get in the final.

H. F. GRANT (BERLIET), WINNER OF TWO EVENTS AT READVILLE

ley Webster, Stoddard-Dayton, and Ralph De Palma, Allen-Kingston, the latter making his debut at track driving. Although no records were broken fast times were made in all the events, and the big crowd—as large as any that have ever attended a Readville race meet—enthused over a well managed and interesting meet.

Grant drove a most consistent race in the 20 miles event for stripped gasolene stock chassis, covering the distance in 20:281/5, without varying three seconds on his time for any of the miles. This event was run in two heats of five miles each and in the first De Palma, Oldfield and Dunham, the latter driving a Corbin, came together. De Palma was really the sensation of the meet and when he opened up a lead on Barney Oldfield and simply walked away from the former track champion the crowd howled, while Oldfield was disgusted. Grant, Berliet; Lorimer, Thomas, and Andrews, American, contested the second heat and it went to Grant without any trouble, Lorimer getting a place in the final by making better time than had Oldfield in the first

Oldfield took the first heat, but De Palma clung to him all the way and got in the final. The second heat had Lorimer, Wing and Andrews in it, and Lorimer got the jump at the start and with Wing in close pursuit the pair fought it out to the finish. The final heat brought De Palma, Oldfield and Lorimer together, and this was perhaps, the finest race of the day. The cars kept together all the way until the last stretch, when De Palma in a great burst of speed passed Lorimer and Oldfield. The latter tried hard to come back with a sprint, but the new crack was not to be denied and he won his first track race. De Palma is an oldtime bicycle and motorcycle crack, who after nearly five years of earnest and constant pleading, recently had lifted a term of indefinite suspension imposed for a lapse he had committed in a motorcycle race.

Because he had made the fastest time for the mile, 58% seconds, De Palma was put on scratch in the five miles handicap, with Lorimer, Thomas-Detroit, on 100 feet; Grant, Berliet, 700 feet, and Andrews, American, 3,200 feet. At the start it narrowed down to a fight between De Palma and Grant, but the latter had an advantage in the handicap.

Stanley Webster, Stoddard-Dayton, had no trouble in winning the curtain-raising five miles for stock touring cars and the pursuit between Seymour, in the Christic car and Basle, in the "Flying Dutchman." proved easy for the latter, as Seymour quit in the third mile.

The fastest time of the day was made by Walter Christie, driving his own car, in the mile time trials. Basle, in the Mercedes, which is better known as the "Flying Dutchman," was second in 58 seconds, Christie's time being 561/5 seconds. The summaries:

Five miles, gasolene stock touring cars—Won by Stanley Webster, 36 horsepower Stoddard-Dayton; second, R. S. Crawford, 40 horsepower Crawford; third, F. E. Wing, 40 horsepower Marmon. Time 6:103/5.

Five miles, free-for-all, gasolene stock runabouts—First heat won by Barney Oldfield, 57 horsepower Stearns; second, Ralph De Palma, 40 horsepower Allen-Kingston. Time, 5 23. Second heat won by L. B. Lorimer, 40 horsepower Thomas-Detroit; second, F. E. Wing, 40 horsepower Marmon. Time, 5:31%. Final heat won by Ralph De Palma, 40 horsepower Allen-Kingston; second, Barney Oldfield, 57 horsepower Stearns; third, L. B. Lorimer, 40 horsepower Thomas-Detroit. Time, 5:23%.

20 miles, stripped stock chassis—First heat, five miles, won by Ralph De Pafmea, 40 horsepower Allen-Kingston; second Barney Oldfield, 57 horsepower Stearns; third, Joe Matson, 32 horsepower Corbin. Time, 5:13. Second heat, five miles, won by H. F. Grant, 45 horsepower Berliet; second, L. B. Lorimer, 40 horsepower Thomas-Detroit; third, J. Andrews, 44 horsepower American. Time, 5:19½. Final heat, 20 miles, won by H. F. Grant, 45 horsepower Berliet; second, R. De Palma, 40 horsepower Allen-Kingston; third, L. B. Lorimer, 40 horsepower Thomas-Detroit. Time, 20:27½.

Special 20 miles race for 40 horsepower and less—Won by L. B. Lorimer, 40 horsepower Thomas-Detroit; second, J. S. Snyder, 36 horsepower Oldsmobile. Time, 21:56%.

Five miles Handicap, free-for-all, gasolene cars—Won by H. F. Grant, 45 horsepower Berliet, (700 feet); second, R De Palma, 40 horsepower Allen-Kingston (scratch); third, L. B. Lorimer, 40 horsepower Thomas-Detroit (100 fet). Time, 4:59%.

Five miles pursuit race—Won by Charles Basle, 90 horsepower Mercedes; Morton Seymour, 50 horsepower Christie, second. Time 4:49%.

Mile against time—Walter Christie, 563/5 seconds; Charles Basle, 58 seconds.

Chicago Postpones Its 1,000 Miles Run.

The Chicago Motor Club has postponed indefinitely its 1,000-mile reliability contest which was to have occurred June 24-27. But seven entries had been attracted.

SUPERSEDING THE WAR HORSE greatl

Gen. Grant's Estimate of the Automobile's Value in Military Operations—Practical Test at Pine Camp.

Though automobiles have been tested by army officers in respect to their utility as dispatch bearers over long distances, the army in this country has had no opportunity to observe the adaptability of motor cars for field manoeuvres until the present time. The military operations now being conducted by regular troops and State militia at Pine Camp, New York, under the direction of Gen. Grant and officers of the regu-

THE MOTOR WORLD

greatly pleased with the excellent showing made by the two machines being tested."

Nine Perfect Scores in Atlanta Run.

It required a lottery to determine the cup winners in the 382 miles sealed bonnet run from Atlanta, Ga., to Macon and return on Thursday and Friday, 18th and 19th insts. The contest was under the auspices of the Fulton County Automobile Club, backed by an Atlanta paper, which furnished the prizes.

Of 13 cars that started, nine finished with perfect scores, and as there were only three cups, one for each of the three classes of cars, they were awarded to the car in each class whose representation fished the lucky number out of a hat. The prizes went to

MAJOR-GENERAL GRANT IN THE FIELD AT PINE CAMP

lar army, have furnished an opportunity for motor car experiments, which was not to be neglected, and two cars are regularly employed in connection with the work of the troops. Both of the machines are Studebakers; one is used by Gen. Grant in the general routine of his field work, while the other is in the service of his staff.

Pine Camp consists of 144 square miles of every conceivable sort of country. Much of it consists of stumps and ruts, while the roads are nothing more or less than deep sand pits, often running over rough, steep hills. Under these conditions the machines are receiving the severest test, and it speaks well for them than Gen. Grant has expressed entire satisfaction with the results obtained from their use. In an interview, the commanding general said:

"I should not have believed that it was possible for an automobile to go the places these two Studebaker machines have gone if I myself had not witnessed it. During the week they have been here they have been put to the most severe test and haven't been out of commission for a minute. They are especially valuable in plotting out problems where it is necessary to carry maps and other paraphernalia not easily conveyed on horseback. I believe that not only is the automobile of great value in military work but, more than that, it is a necessity. I am

the Stearns in Class A, the Thomas, in Class B, and the Ford in Class C. Silver medals solaced the top-notchers who were unlucky in the drawing. There were large crowds at Atlanta to witness the start, at Macon to welcome the cars there, and at Atlanta to see the finish, while there were enthusiastic gatherings of spectators at many points along the route. An inspiriting feature of the finish was the arrival of seven of the leaders who got together just outside of Atlanta and entered the city in a sort of parade. The relative performances of the several cars were not determined until the following day, the prizes being awarded in the evening at an enthusiastic meeting of all concerned.

DEALERS DIP INTO RACE CONTROL

Go Through the Motions of Taking Charge of Briarcliff Affair—Moore and Morrell in Background.

The "dozen or more dealers" who believe that they should have a great deal to say about race sanctions and disqualifications and one of whom is credited with saying that the box office should have something to say about the control of sport, finally have unveiled themselves. They prove to be some of the dealers who were "rounded up" by "good, old" Tom Moore after his wonderful Metropolitan Automobile Association, which consisted chiefly of himself, blew up, following the Motor World's illumination. Moore then formed the dealers into the Automobile Manufacturers Committee and promoted the Briarcliff road race.

Moore, who, by profession, is a press agent, was first also to discover how valuable is a man like Robert Lee Morrell to Moore's profession. Last week, Moore and Morrell went through the motions of laying down their Briarcliff plumes and duly turning them over to the "dozen or more dealers." They-that is, the chairmanship and the secretaryship, respectively-were as duly assumed by C. F. Wyckoff and Sidney B. Bowman, who are credited with saying that they again will run the Briarcliff race, whether or no the A. A. A. or the National Association of Automobile Manufacturers approve it. In due course, it is expected that Moore and Morrell will be "induced" to return to the assistance of the dealers, who, it is fair to guess, eventually will kick themselves in the shins when they realize how they have been "used" to pull other's chestnuts out of the fire.

How the A. C. A. Proves Its Best Wishes.

According to the Louisville (Ky.) Herald, emissaries of the disgruntled Automobile Club of America (of New York), were in that city last week endeavoring to induce the Louisville club to secede from the American Automobile Association, which when it found that it could not dominate the A. A. resigned therefrom, accompanying its resignation with what it styled "best wishes," and which now is engaged in proving how much they are worth.

Idealism of the New England Tour.

The New England tour of the Automobile Club of America left the club house in New York on Saturday last with 18 cars in line, including the one occupied by the manager. It was styled "the ideal tour." Some of the idealism was reflected by two rather large flags with which each car was decorated and by a set of rules which might serve as well for a touring contest or an endurance run.

PATENTS AS PRICE PROTECTORS

Their Legal Effect as Remedy for Rate Cutting not Generally Appreciated— Court Rulings on the Point.

The fact that the Weed Chain Tire Grip Co. recently was able to obtain an injunction restraining the Times Square Automobile Co. from cutting the price of its product and that subsequently Judge Ward in the United States Circuit Court in New York imposed a fine of \$100 on the price-cutters for violating the injunction, excited wide interest in the trade. It clearly indicated that where there is a will there's a way to check price-cutting, and to make it an expensive occupation.

In discussing the subject a few days since, T. F. Bourne, 220 Broadway, New York, a counsellor who makes a specialty of patent and trademark causes, and who has handled several such cases for automobile concerns, remarked that the average patent owner has not more than a very superficial knowledge of the great power in respect to the fixing and maintenance of prices which the patent gives to him. In fact, Mr. Bourne talked so interestingly to the Motor World representative that he was induced to reduce his views to writing. These views constitute a fund of information that should serve to stiffen many backbones in the automobile trade. Mr. Bourne

"The Supreme Court of the United States, in E. Bement & Sons vs. National Harrow Co., 168, U. S. 70, said:

"'The very object of these laws is monopoly, and the rule is, with few exceptions, that any conditions which are not in their very nature illegal with regard to this kind of property imposed by the patentee, and agreed to by the licensee for the right to manufacture or use or sell the article, will be upheld by the courts. The fact that the conditions in the contracts keep up the monopoly or fixed prices does not render them illegal.

"'The provision in regard to the price at which the licensee would sell the article manufactured under the license was also an appropriate and reasonable condition. It tended to keep up the price of the implements manufactured and sold, but that was only recognizing the nature of the property dealt in, and providing for its value so far as possible. This the parties were legally entitled to do. The owner of a patented article can, of course, charge such prices as he may choose, and the owner of a patent may assign it, or sell the right to manufacture and sell the article patented, upon the condition that the assignce shall charge a certain amount for such article.'

"With respect to the Interstate Commerce Act, the Court said:

"'But that statute clearly does not refer

to that kind of a restraint of interstate commerce which may arise from reasonable and legal conditions imposed upon the assignee or licensee of a patent by the owner thereof, restricting the terms upon which the article may be used and the price to be demanded therefor. Such a construction of the act, we have no doubt, was never contemplated by its framers.'

"It is thus seen that patentees have a particular and peculiar monopoly which they may exercise to their best advantage. The foregoing decision was followed in John D. Park & Sons Co. vs. Hartman, 152 Fed. Rep., 24, where the court said:

"That articles made under patents may be the subject of contracts by which their use and price in sub-sales may be controlled by the patentee, and that such contracts, if otherwise valid, are not within the terms of the act of Congress against restraints of interstate commerce or the rules of the common law against monopolies and restraints of trade, is now well settled.

'The patent grants an exclusive right to use, to make, and to sell. The patentee may grant, if he will, an unrestricted right to make and sell or use the device embodying his invention, or may grant only a restricted right in either the field of making, using, or selling. To the extent that he restricts either one of these separable rights, the article is not released from the domain of the patent and any one who violates the restrictions imposed by the patentee, with notice, is an infringer.'

"It is well established that where a dealer or jobber, or even a licensee, under a patent breaks the terms of the contract he entered into relative to the patented article, he may be sued as an infringer of the patent.

"In National Phonograph Co. vs. Schlegel, 128 Fed. Rep., 733, the Court said:

"'An unconditional and unrestricted sale by the patentee, or by a licensee authorized to make such sales, of an article embodying the patented invention or discovery, passes the article without the limits of the monopoly, and authorizes the buyer to use or sell it without restriction; but to the extent that the sale is subject to any restriction upon the use or future sale the article has not been released from the monopoly, but is within its limits, and, as against all who have notice of the restriction, is subject to the control of whoever retains the monopoly. This results from the fact that the monopoly is a substantial property right conferred by law as an inducement or stimulus to useful invention and discovery, and that it rests with the owner to say what part of his property he will reserve to himself, and what part he will transfer to others, and upon what terms he will make the transfer.'

"In Edison Phonograph Co. vs. Kaufmann, 105 Fed. Rep., 960, the Court said:

"'I cannot doubt that the complainants have the right to sell their patented phonographs with the restrictions and upon the conditions contained in their "jobber's agreement," and that dealers buying the patented instruments from the jobbers with notice of those restrictions and conditions are bound thereby.'

"Thus, the owner of a patent who manufactures and sells a patented article may reserve to himself, as an ungranted part of his monopoly, the right to fix and control the price of the patented article at which jobbers or dealers buying from him may sell to the public, and a dealer who buys from a jobber with knowledge of such reservation, and re-sells in violation of it, is an infringer of the patent, and it was under this doctrine that the chain grip case referred to above was decided.

"There is another point in patent law of importance to manufacturers of patented articles, and that is the restrictions a manufacturer may place upon the use of the goods. The manufacturer may restrict the use of the patented articles, by giving proper notice, of other parts to be used in connection with the patented atticle, even though such parts are not patented. This has been sustained by the United States Courts, in Heaton-Peninsular Button-Fastener Co. vs. Eureka Specialty Co., 77 Fed. Rep., 288; in Rupp & Wittgenfeld vs. Elliott, 131 Fed. Rep., 730, and other cases. In the first named case the licensee was given the right to use the machine only in connection with unpatented staples furnished by the plaintiff, and it was held that the owner of the patent had the right to sell such machines subject to the condition that they should be used only with fasteners manufactured by him. The machines were sold and not leased, yet the Court held that the purchaser of the machines under such circumstances would be in effect a mere licensee, and the use by him of the machines contrary to the conditions imposed would be not only a breach of the contract but a violation of the monopoly for which an injunction suit would lie. It was also held that the manufacture and sale by another party, to the users of such machines, of staples which were intended to and only could be used therein was a contributory infringement and would be enjoined. The United States Supreme Court has cited this case with approval.

"In the Rupp case machines were licensed by the patent owner with restrictions that they could be used only with wire purchased from such owner; the wire was especially adapted for the machines and put upon certain reels, and the sale of wire by others adapted and intended for use in these machines, with knowledge of such use, was prohibited. In this case the Court said:

"'The mere sale of wire which might be used in the Elliott machines, or for some other non-infringing use, would by no means constitute the appellants infringers. It is the sale of wire adapted to the infringing use, with the intent and purpose that it shall be so used, which constitutes contributory infringement.'

n, ADJUSTING CONTROL MECHANISM

Importance of Eliminating Lost Motion and Disalignment of Parts—Keeping the Gears in Register.

Transmission mechanisms do not give the owner and repairman the trouble they did up to within a short time, more especially because designers have come into a just appreciation of the requirements of the case. If the adjustment of the various parts is maintained in its proper relation, and the mechanism of control is handled with even moderate rationality, there is little danger of trouble arising from broken gear teeth, and twisted shafts, such as was so prevalent a year or two ago. At the same time there are one or two points about the average mechanism of this sort, particularly if of the so-called sliding gear type, which re-

quire especial attention from time to time.

Aside from poorly tempered metal in the gears, and distinctly abusive handling, the most prevalent cause of gear difficulties arises from lost motion in the connecting mechanism leading to the control lever, and in poor adjustment in the same quarter. The result is apt to be the same in either case, and not simply produces lack of registry between the ends of the gears when they are supposed to be in mesh, but causes them to go into and out of mesh at slightly earlier or later times than are indicated by the position of the lever. The result is that the operator experiences no small amount of uncertainty in changing gears, and in consequence, is quite apt to handle the lever much more harshly than he otherwise would do, so tending to aggravate the difficulty.

For the good of the gearset, therefore, the transmission case should be looked into periodically, and the various gears tested for accuracy of mesh, any possible lost motion in the connected linkage being sought out at the same time. It is a matter of but a few moments' inspection to try out the set in all its positions, when the cover of the case has been removed for the purpose of inserting new lubricant. If any lost motion exists, it can be taken up by adjustment, in many instances. Otherwise bushings, or possibly, new parts, may be required.

In a well made car, lack of registry in the gears, is usually a sign that something is radically wrong—a rocker arm sprung, a bracket broken or displaced, or some part pulled badly out of shape. Rectifying these slight difficulties serve to bring the handling of the machine back into its normal condition with surprising success, and also prevent the possibility of a more serious condition arising, which is apt to result directly in an accident of a disastrous nature.

For convenience and certainty in handling the car, nothing is more essential than close and accurate adjustment of the control mechanism. This principle applies most particularly to the parts regulating the transmission of power from the motor to the driving wheels.

Wonderful Promise in New Tire.

Among the bits of promise which are held out in prospect to the British motorist at this time is a new and improved form of pneumatic tire, which it is said a large firm of cable builders has been at work upon for more than two years. During this time, experiments have been made on a specially prepared testing track, upon which the tires are tried out, as mounted on an electric vehicle. All sorts of road conditions are counterfeited on the course, which is so severe that the average tire of commerce is said to give way, either from bursting or wear, in somewhere about 100 miles. The new product has been so thoroughly developed up to this time, that it will stand over 3,000 miles under similar conditions, as is claimed. In other words, it is claimed that the new tires, which are soon to go into the market, are 30 times as durable as any which have yet made their appearance.

Remedy for Blown Out Tire Casing.

Of the several possible methods of removing the difficulty which arises from a blown-out tire casing, two which readily suggest themselves are the complete renewal of the shoe, and the binding up of the wound with a band or two of the Kimball tire casing, made by the Kimball Tire Case Co., Council Bluffs, Iowa. As the latter method ensures considerable additional use to the cover without waiting on the tire man, its advantages are obvious. The Kimball tire casing is merely a series of shorts bands of steel plates linked together and surrounding the shoe, the end pieces being hooked over the flange of the rim. Any number of such bands may be used from one or two, as may be required to reinforce a weak spot, to a sufficient number to form a complete armor for the tire. In any event, they form a durable and flexible protection, secure traction where the road surface is bad, and prevent skidding.

How to Insure the Water Circulation.

On automobiles where the water circulation is dependent on the action of a frictiondriven pump, it often happens that the contact between the wheel of the pump and the fly wheel of the engine is not sufficiently firm for the purpose of circulating the water. Obviously this lack of contact will explain the cause of the water circulation being sluggish, and it is of the greatest importance that the circulation should be constant and as rapid as possible. Naturally to overcome this condition of affairs it only is necessary to increase the frictional contact between the pump and the fly wheel. Care should be taken to keep both of these wheels free from oil and grease.

"In Tubular Rivet & Stud Co. vs. O'Brien, 93 Fed. Rep., 200, it was held that where the owner of a patent for setting lacing studs licensed the use thereof on condition that the licensee should only use study manufactured by the licensor, such studs not being patented, it was an infringement for the licensee to use the machine for setting studs obtained from others in violation of the license, and it was further held that a third party who sells to the licensee studs of his own manufacture, knowing that they are to be used in the patented machine, in violation of the terms of the license and intending that they should be so used, is guilty of contributory infringement, and will be enjoined.

"This doctrine of contributory infringement is very important to patent owners. It is to the effect that one person may not sell an essential portion of a patented combination, with the knowledge that it will be used by another who manufactures the other portion of such combination, to enable the different parts to be used in the completed combination."

New Recording Speedometer-Odometre.

A new device for registering speed, as well as for recording the movement of a car. has been brought out by the Recometre Co. of America, who recently have opened an office at Seventy-fourth street and Broadway, New York City. The instrument, which is called a Recometre, consists of a speedometer and an odometer combined with mechanism designed to record upon a strip of tape a permanent record of the movement of the car. This permanent record is obtained in ink and shows the number of miles traveled, the number of minutes to the mile, the number of stops made, and the exact duration of each stop. The records are made through the medium of a self-inking recording pen whose action is governed by the same mechanism that actuates the speed indication. The construction of the Recometre permits of an examination of the tape at any time, but the record of the car for the last half hour constantly is in view. Obviously this arrangement can be used to positively settle all disputes which may arise in relation to broken traffic regulations, or questionable police timing.

One of the commendatory features of the device is that it is under the control of the owner and cannot be affected by any one not in possession of the key. The instrument is operated by a flexible shaft attached to the front of the car in the usual way, with the exception that it differs from many speed indicating devices in that the link attachment is positive and cannot be removed after it is set. This arrangement precludes the possibility of anyone tampering with the machine without the owner knowing of it. The dimensions of the instrument are 5x5x5½ inches. It is finished in polished brass and is designed as a dash attachment.

OLDSMOBILISTS HOLD REUNION

Third Annual Outing of Clan—Motorists
Beat Scribes at Baseball—New Owner
Wins Touring Car.

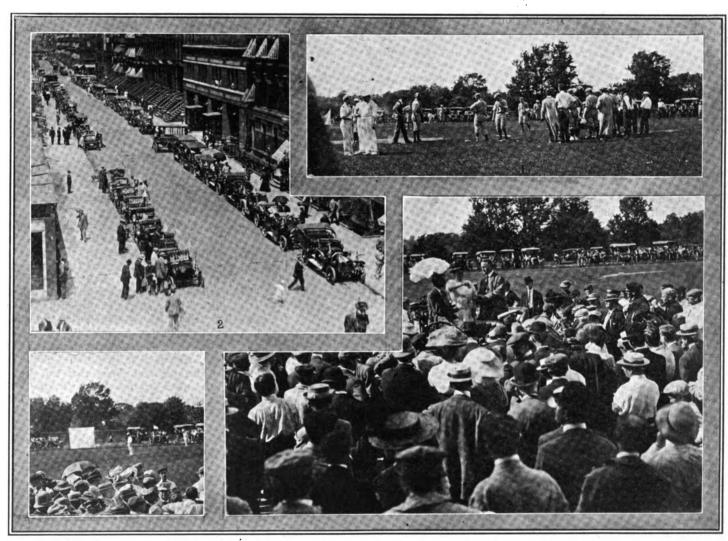

Nearly 200 owners answered the call of the Cutting-Oldsmobile clan and came together on Saturday last, 20th inst., the occasion of the gathering being the third annual reunion of Oldsmobile owners. The two former reunions were held at the EmGeneral and his staff at its head in a modern touring car. After the General came a commercial vehicle containing the Old Guard band and following them came Oldsmobiles of every type and vintage, from the little curved dash pop guns of years ago to the 1908 touring cars and roadsters.

On reaching the grounds the cars lined up around the field and then the fun began in the form of a ball game between an Oldsmobile team and one composed of newspaper men. Despite the fact that Johnny Wetmore played right field for the scribes, ticket drew the coveted prize. In winning the machine, which had been donated by the company, Schmidt exemplified the Biblical quotation "to him that hath shall be given," for only recently he entered the Olds clan through the purchase of a \$1,900 runabout. However, he accepted the prize without protestation.

Club Wars on Reckless Driving.

In the hope of checking reckless automobile drivers, the St. Paul (Minn.) Automobile Club has adopted a rule which requires

SCENES INCIDENTAL TO THE OLDSMOBILE REUNION.

1. BETWEEN INNINGS AT THE BALL GAME.

2. LINED UP FOR THE PARADE.

3. DRAWING FOR THE OLDSMOBILE.

pire City track, between New York and Yonkers, and have been marked by racing events. This year's gathering took place at Columbia oval, situated on the corner of Jerome avenue and 210th street. New York, and was signalized by a base ball game which displaced the usual racing features of the former gatherings.

This year's reunion, like its predecessors, was organized and controlled by General J. T. Cutting. The Oldsmobilists gathered in the vicinity of Fiftieth street and Broadway, where they formed in line for a parade which started at 11 o'clock, with the

and that Umpire Fred J. Wagner was full of sympathy for, and lent all the aid in his power to the newspaper writers, the Oldsmobile team won and a scorer, who feared the power of the press, charitably said that the score for the five innings was 12 to 9 in favor of the motorists.

After the ball game a drawing was held for a \$2,750 Olds of the latest type. Numbered tickets for the drawing had been issued to all the Olds owners who participated in the morning parade. L. L. Schmidt, described as a Hoboken (N. J.) hardware merchant, was the lucky individual whose

all the members to report every case of reckless driving that comes under their notice. The club engages to punish the offenders whether or not they are club members. The club also has offered a reward of \$50 to any one who establishes the identity of any driver who is concerned in an accident and drives away without identifying himself. In addition to these efforts to be of general benefit the club offers a reward of \$50, which reward of a like amount will be paid to any person who apprehends a thief who steals a machine belonging to a member of the club.

DECEPTION PUNISHED AS LARCENY

Massachusetts Court Convicts Sellers of Worthless Car—Victims Bought Off, but Compelled to Prosecute.

In Massachusetts they have laws which, if the same were to be enforced in New York State, would bring weeping, wailing and gnashing of teeth in the camps of some of the cut-rate second hand dealers in automobiles, whose methods of business have oft brought sorrow to their innocent patrons. One of these laws for the protection of the unwary has resulted in the conviction on Friday, 19th inst., of Andrew F. Gormley and Paul C. Hersey, on a charge of larceny in the Superior Criminal Court of Boston.

From the evidence in the case it was established that Gormley and Hersey advertised an automobile for sale, and claimed that the machine was in good condition (as is usually the case, see daily papers). Frederick B. Drury, of South Barrington, N. H., read the advertisement, and with his wife went to Boston, where he met the defendants and bought from them for \$200 the automobile which they had advertised as being in good condition. When the machine was tried, it was found to run down hill in very good time, but it would not go in any other direction. Drury complained to the authorities and the sellers were arrested. They were to have been tried on Friday, 12th inst., but the complainants were not in court on that day. A court officer was sent after the Drurys, and they appeared the following Friday. In the trial which followed, it was brought out that Drury had gotten back most of his money and was not especially interested in prosecuting the prisoners; the latter, however, were convicted and will be sentenced this week.

Status of Old Licenses in New Jersey.

Attorney-General McCarter, of New Jersey, has handed down an opinion regarding the validity of licenses issued by the State prior to April 16 last, when the new law was approved by the Governor, which will result in a saving of several hundred thousand dollars to the State treasury and a corresponding loss to motorists. The Attorney-General holds, and has so advised J. B. R. Smith, Commissioner of Motor Vehicles, that licenses issued in the period from January 1, 1908, to April 16, 1908, shall be good for a full year, but is of the opinion that there shall be no pro rata license fees for the fraction of a year remaining between the expiration of a license taken out in 1907 and December 31 of this year.

The opinion does away with the contention that licenses issued in 1907, no matter when, were valid until the end of this year by the amendment of the law passed last winter. Had this conception been upheld

New Jersey would have suffered a loss of several hundred thousand dollars in fees that will now have to be paid, as well as placing the State motor vehicle department in the embarrasing position of having collected nearly \$100,000 in fees illegally since the passing of the law.

"Square Deal" Plan Superseding Traps.

The "square deal" plan, by which a very general observance of the speed limit by motorists passing through the town of Middleboro, Mass., has been brought about, is attracting the attention of other town authorities in the Bay State. This plan, which has been described in the Motor World, is likely to be adopted in a number of towns, although there are some places where it is felt that the town itself would not go to the expense of displaying large banners as Middleboro has done through the local automobile club. The town of Wareham is the first to follow along the line shown by Middleboro, where the selectmen have just authorized local motorists to go ahead and display "square deal" banners. Arrangements are already started for the formation of either a permanent automobile club to have charge of the matter or to have a committee to immediately put up the speed banners and let the club organization come along in a week or two. The selectmen promise to abolish the "traps" permanently if the motorists passing through observe the "square deal" by limiting their speed to the rate specified on the banners.

Jersey Trap with Four Operators.

Supplied with about a quarter of a mile of insulated wire, a stop watch, some electric bells, six dry cells, a push button or two and a couple of ropes, to say nothing. of a few signalling flags, three Jerseyites under the leadership of L. J. Underhill-a Perth Amboy detective-are operating a variation of the usual form of constabulary speed trap in the vicinity of New Brunswick, N. J. When a car enters the trap, the man at the beginning of the block signals to Underhill, who is a quarter of a mile away, by means of the push button and bell; Underhill starts the watch, and stops it as the automobilist passes him.'- If the speed limit has been exceeded a signal is given to a flagman still further along, who signals the car to stop; if the signal is disregarded, a fourth man still further down the road is notified and he stretches a rope across the highway. When the offending car stops, a Jersey constable is at hand to uphold the majesty of the law by a prompt hearing of the charge.

El Paso Owners Organize a Club.

The El Paso Automobile Club has been organized in El Paso, Texas. The following temporary officers have been elected: Chairman, E. P. Hughes; secretary, G. R. Le Baron; chairman of executive committee, H. C. Miles; secretary of executive committee, W. R. Humphries.

CHICAGO WINS WHEEL TAX FIGHT

Supreme Court Decides in Favor of the City
Ordinance—Automobilists Organize a
New Attack.

Chicago's wheel tax ordinance has again withstood the attacks of automobilists and other vehicle owners who have been fighting it in the lower courts and in the Supreme Court. The lower courts held that the statute and the ordinance are constitutional as far as they relate to vehicles used for business purposes, but that vehicles used for pleasure are exempt from taxation under provisions of the law. The Supreme Court, Justice Cartwright dissenting, holds that all vehicles, both business and pleasure, may be taxed. The decision contains the following paragraph:

"It is urged that the Legislature is without power to authorize the City of Chicago
to pass an ordinance requiring vehicles
using its streets to pay a license fee for
keeping the streets and alleys in repair.
We think it clear that a license may be imposed and the fee for such license collected
with a view to revenue only, and if such be
the law, the fact that the license required
to be paid by said ordinance in this case is
for revenue only does not render the statute
under which the ordinance was passed and
the ordinance itself unconstitutional."

Immediate collection of the wheel tax is proposed by the city officials, and the resulting revenue is expected to give Chicago an annual fund of \$750,000 for street repairs. City Clerk McCabe was notified by First Assistant Corporation Counsel Wetten, on the 20th inst., that this decision, rendered in what is known as the Harder cases, covers practically all the points involved in the other suits pending against the validity of the measure and that it would be a waste of time to await their decision.

City records show that owners of 1.680 vehicles have already voluntarily paid \$9.806 in taxes to the city. Only eight automobiles are included in the number.

The automobilists, who have made the most determined effort to evade the tax, continued their fight on the 19th inst., when an amended bill was filed in the Superior Court by C. A. Coey and several hundred others. The automobilists make the novel plea that their machines use only parks and boulevards, which are not under control of the city, and that the municipality does not pay for their repair. They also contend that the wheel tax is a double tax on automobiles.

Greece Musters Sixty Automobiles.

In Greece there are 60 automobiles. Thirty of these are owned by residents of Athens, and the rest are scattered throughout the country. Gasolene is sold for 60 cents a gallon.

ABOUT THE OXY-ACETYLENE TORCH

Its Adaptation to Quick and Effective Welding—Marvelous Economy in Repair of Broken Parts.

Great prominence is given to the use of the new and high grade materials to which so much of the improved service of the modern car is attributable. But while the progress which has made possible their use is loudly acclaimed, the fact that it represents only a very small proportion of the progress which has been necessary in order to make their use efficient and economical is not so generally appreciated. This idea is developed in a recent bulletin issued by the technical committee of the Long Island Automobile Club, of which Louis T. Weiss is chairman, and which is one of a notable series of "pointers" to the members on the management and upkeep of their machines.

The point brought out in this connection is that following the successful adoption of ball bearings, a special metal had to be developed for the balls; that the progressive growth of high-grade steels has resulted in the introduction of special tool steels, without which it would be a practical impossibility to handle the new metals. As a crowning element in the metallurgical structure, is mentioned the discovery of a flame "hot enough to melt broken parts together, uniting them into a stronger unit than we had before it had been broken." It is with the properties and utility of this, the oxyacetylene flame, that the paper deals most particularly, and more especially with the economical phase of its use.

As is already generally known, the oxyacetylene flame, corresponds exactly to the oxy-hydrogen flame which is familiar in the mechanic arts. As used, the acetylene gas is burned in a surrounding mantle of oxygen. The chemical action is the same as when acetylene is burned in the ordinary way in the air, but as a large proportion of the air is useless for purposes of combustion, the action is less rapid than when carried on in the presence of pure oxygen. Hence the tremendous degree of heat developed, and the high temperature of the flame which approaches that of the electric arc, if not surpassing it, and has been determined to range somewhere about 6,300 degrees, Fahr.

"You have probably seen the storage battery maker use a torch with oxy-hydrogen gas in burning lead together at the terminals or connections between the several cells," says the bulletin above mentioned. "The oxy-acetylene torch produces, according to its size and the purpose used, a flame consisting of an outer mantle and the exceedingly hot, but small and pointy inner core. When the core of this flame is played onto a piece of steel, cast iron or any other metal, such surface melts immediately un-

der the terrific heat. The end of a steel wire or rod of suitable thickness (depending on the size of flame and job in hand) may be brought into the flame when it melts and flows on to the molten surface, and unites therewith thoroughly. In that manner cast iron, aluminum, brass, even steel and cast iron, etc., can be united. In case of a break of an axle, steering knuckles or any other part where the pieces must be butted together closely, the flame would not get into the break far enough to make a good job. In such a case the operator cuts enough material away so as to make a wedge-shape opening, enabling him to melt both surfaces, adding steel to fill it up from the bottom and make a perfect weld. If the mechanic is an expert with the torch he will succeed in uniting the broken part and heating it to a red heat not further than perhaps one-half of an inch distant from the break, so that a hole or screw located that distance away will not be disturbed, and a pin or nut fitting such hole or screw previous to the breaking will do so after the repair has been done.

"As before said, not the steel parts only can so be repaired quickly and effectively, but the aluminum crankcase as well as a cylinder, a lug on them or any other part, which although inexpensive cannot be obtained quickly, can be repaired quickly and satisfactorily."

Referring to a couple of instances in which the writer's own observation has enabled him to judge of the economy of the process, the case of a broken axle on a well known make of car is mentioned. The break occurred in the front axle and in the lower member of the fork receiving the steering knuckle, the part being completely broken off.

"A new axle meant an expense of about \$75," continues the report: in contradistinction to which, "it was repaired with the flame in less than an hour, and cost \$2.50. The thread in the hole, less than three-quarters of an inch away from the break, received the screw without difficulty. The axle is just as good as it ever was, and a little stronger in the place where it had been broken.

"Another, but less serious break; namely, the breaking in two of a malleable iron exhaust elbow casting, follows:

"A new elbow could have been bought for \$1.50, but it not being in the stock of the agents, a delay of ten days was probable. One dollar paid for the welding of it, and it was none the worse for looks."

Demountable Front Fenders for Cars.

Many of the better designed cars have front fenders so contrived that they may be readily dismounted when it is necessary to effect repairs upon the motor. Where such arrangements exist, it is, of course, necessary to make sure that the adjustments are kept secure whenever the machine is in use, otherwise there is danger of their getting "adrift" and injuring the machine.

TOUCHING UP AND VARNISHING

Difficulties Attending Renovation of the Body Finish—How to Meet Them—
Important Preparatory Work.

"Touching up and varnishing," is the timehonored method of refreshing the appearance of a vehicle when circumstances do not justify its being given a thorough going over. In the lore of the carriage trade it has played a most important part for many years, and naturally enough, with the development of the automobile paint shop, it has come to the front in that connection as well. But touching up a buggy and touching up a motor car are two very different things, and the experienced painter who attempts to revamp a shabby-looking car often finds himself plunged in a well-nigh hopeless task. The economy brought about by touching up a used car in some cases, is broadly offset by the poor results obtained in others when the same process is applied. And the question of choice is far more complicated than in the case of the horse-drawn vehicle. Concerning the ethics of the matter, the Carriage Monthly gives some good advice.

"To a greater extent than the horsedrawn carriage, the automobile invests the work of the painter with difficulties of a not infrequently perplexing nature," says that authority. "Taking cars as they come, the surfaces are in a worse condition than the first named class of vehicles, because, without question, a much harder form of service is imposed upon the automobile. The wrenchings and twistings, oscillation, and lateral motion, etc., despite authorities to the contrary, work injury to the surface, although such injury may not always make itself apparent until the outer film of the varnish is stripped off to some extent under the erosive effects of the rubbing pad. Moreover, the general conditions of service are of a kind to put the surface into a more or less disabled state, the varnish being badly worn in some cases, having reached possibly the incipient stage of perishing, or the color showing a faded appearance, or a lack of uniformity in the wear gener-

"Probably the worst conditioned surface, as it comes to the paint shop for repairs, is the enameled one. It is claimed that this latter finish, in the main, is harder and stronger, and better fortified to withstand hard usage than the regulation paint and varnish finish, and to a certain extent this may be true, but the enameled surface after losing the primal brilliancy of its finish, and touched off with some hefty bruises, takes on a shabbier look than the paint and varnish finish is scarcely ever capable of.

"Then, too, the surface of metal, aluminum, or steel, or iron, contributes a further share of difficulty to the touch up and var-

KEEPING TABS ON THE CHAULEEUR

Canadian Owner's System for Keeping His Car in Condition-Making the Chauffeur His Own Checker.

What is admittedly the most uncertain factor incident to motoring in its present day phases, is the human equation of the chauffeur. No matter how competent and skilled a man may be, there is always the harrowing suspicion in his employer's mind that he may be neglecting some little attention which the car requires, that he may be "faking" repairs, or that he may be using the machine for his own purposes, out of hours. Most well-ordered garages have systems designed to eliminate this uncertainty as far as possible by checking the cars in and out, and generally giving an account of the doings of the various drivers on the boarding list. Such systems have their faults, however, and are not always carried out with the integrity which is theirs nominally. A system designed to obviate many of these drawbacks, and also to account for the condition of the car in a way which a verbal report cannot do, has been originated by a Canadian motorist with the purpose of maintaining a continuous and practically automatic record of the condition of the machine and cost of its upkeep at all times.

The system involves the use of a specially prepared blank, printed on an envelope and intended to be filled out every morning before the car leaves the garage, and presented to the owner as he takes over the car for the day. The blank contains a complete report as to the condition of the machine. Within the envelope are placed receipts for any supplies or parts which may have been purchased during the previous day. No accounts are to be charged, and the enclosed vouchers furnish a complete record of all outstanding expenses current. Any repairs or supplies required are listed on the reverse side of the envelope, so that expenses due are accounted for as well. The questions appearing on the blank are

Mileage register? (total miles). Trip register? — miles. (Move to zero every morning).

Miles driven yesterday?

in the following form:

Is clock working properly? — minutes slow—fast.

Is speedometer working properly? About how many gallons of gasolene in

Are spark plugs clean and engine working

properly? Is right rear tire properly inflated? Is right forward tire properly inflated?

Is left rear tire properly inflated?
Is left forward tire properly inflated? Is tire repair outfit including pump com-

Is there an extra rear inner tube in tonneau?

Is there an extra forward inner tube in tonneau?

Is rear lamp trimmed and filled? Are front oil lamps trimmed and filled? Are acetylene lamps in good order? Is acetylene lamp generator filled with carbide and water?

Mention any tools broken or missing? Is Gabriel horn working properly? Is engine oil can in back of car filled? When was car washed last?

When was brass work polished last? Mention on back any repairs or attachments needed, damages done to car or matters which owner should be informed of.

Mention on back any supplies, gasolene,

etc., bought since last report was made (enclose receipts for bills paid). Do not have any bills charged.

Questions that can be answered "yes" mark opposite *.

It will be seen that most of the answers will be in the affirmative so long as the car is in good working condition, so that the status of the report ordinarily will be merely that of a certificate of inspection. The items referring to the condition of each of the tires individually, are of no mean importance, while the items relating to the mileage of the previous day, both by total and trip records, put an effective check on the

use of the machine. The idea was originated by Morris P. Bryant, of Montreal, a member of the Automobile Club of Canada, for his own use. There are no superfluous queries," says Motoring, in regard to it, "and the instructions to 'mention on the back of the report any matter which the owner should be informed of,' gives the chauffeur plenty of scope for suggestions, while it leaves no excuse for omissions."

Care in Manipulating Planetary Gear.

Although it is generally supposed that less skill is required in the manipulation of the common planetary change gear than is demanded by the sliding pinion type, the fact remains that unless the former system is handled with good judgment, not simply the gearset, but the entire transmission, and even the motor, will suffer greatly. The point is that it is rather difficult to determine the exact point at which the low gear should be abandoned for the direct drive. when starting from rest, or finishing a hillclimb. If the use of the low is carried too far, the resultant grinding of the gears is in itself sufficient indication of the heavy burden which is being thrown on the very small parts, which at their high rate of speed, are apt to be worn very rapidly, and even to chip, if too hard. If the high gear is applied before the car has attained sufficient momentum, on the other hand, the effect of throwing a sudden overload on the engine is apt to be even more serious.

All Metal Piping for Cooling System.

All-metal piping, with screwed connections is most desirable for use in the cooling system. Where for any reason, flexible metal tubing cannot be employed, sliding joints may be supplied at the points of

nish proposition. Many of these surfaces, around moldings and edges, show a scaly condition due to numerous causes, and in such cases the fragmentary structure of paint should be scraped away until a solid base is reached. Then touching the diseased parts with a pigment containing at least one part of oil to four parts of turpentine should follow. After a lapse of 48 hours these fractures and indentations may be puttied up with a good, hard-drying putty, which in due time can be evenly faced down with a block of rubbing stone dipped in raw linseed oil. Naturally, if such surface conditions exist to any considerable extent, the only permanent way of treating them is to either burn the paint from the surface entirely, or coat the old structure of pigment solidly under, say, three coats of roughstuff. They are not easily concealed by simply touching up and varnishing, although many of them are handled in this way, after facing up with putty as above advised, except in cases where glazing colors have been employed.

"Generally speaking, the line should be drawn on all jobs stopped for touch up and varnish which show any considerable extent of wear, because in a majority of instances of this kind the touching with color only serves to intensify the effect existing between the old and the new, and following the application of varnish, this effect is likely to increase rather than diminish.

"It has always been a question with the painter of carriages, either horse-drawn or horseless, as to what should constitute the precise dividing point between the touch up and varnish job, and the one demanding more thorough treatment; and the common understanding seems to have been reached that decision in the matter rests with the individual painter rather than with any hard and fast rule promulgated by a committee of experts.

"In all touching up and varnishing work, the surface should, after cleaning, be nicely flatted out by rubbing with water and No. 00 pumice stone flour. Then touch with color to the least possible extent, using the pigment thin enough to avoid an abrupt edge which under the varnish shows rough and patchy. Flow on a fine, heavy coat of finishing varnish, which, upon the automobile as upon no other vehicle, perhaps, plays the chief part in making the prairie like surface 'a thing of beauty'.'

Proper Joints for Water Connections.

Soldered joints and rubber hose should be avoided in all water connections involved in the cooling system of the car. Vibration cracks the solder, or, if it has not been properly applied, opens any little crevices where there has not been sufficient flux to cause it to stick. The faulty performance of rubber hose when conducting hot water, is too well known to require comment, and the destructive action of hot water on rubber makes the use of such hose costly.

HOW ONE MODERN NIMROD HUNTS

Colorado Motorist Scales High Points of the Rockies in Pursuit of Game—Big Bag for Three Hours.

While automobiles occasionally have been employed in hunting expeditions, the use for this purpose generally has been confined to a day's outing or for some special occasion, M. C. Ramsey, an enthusiastic motorist of Grand Junction, Colo., has varied the usual proceedings in this connection by making extended hunting trips through the Rocky Mountains in

and other obstructions, and to secure appliances and means of safeguarding railroad crossings and dangerous points in the highways. The organization also seeks "to promote such social relations between the members of this corporation and between this and other similar organizations as may be deemed desirable." The dues will be \$10 a year.

White Cars Resume Presidential Service.

Despite keen competition on the part of other automobile manufacturers, on the return of President Roosevelt to his summer home on Saturday, the two government White steamers resumed service at Oyster Bay, the "summer capital" of the nation.

M. C. RAMSEY DRIVING HIS RAMBLER OVER HIGH POINT IN THE ROCKIFS

a single cylinder 1904 Rambler which, in all seasons of the year and under all road conditions, he drives on long hunting excursions into the mountains after game. Early in 1908 Ramsey made a hundred mile run up the western slope and reached the highest point of the Rockies yet attained by an automobile, which shows Ramsey driving his care over this highest point on his rugged route. The accompanying illustration shows the sort of road conditions he encountered when near the end of his journey. On this occasion he returned to Grand Junction with 78 rabbits as a result of three hour's shooting.

Motor League of Rhode Island Organizes.

The Motor League of Rhode Island has been organized with the following temporary officers: President, George H. Huddy, Jr.; secretary, Joseph S. Gettler; treasurer, George C. Darling. The objects of the organization, which is to be incorporated, are to secure the enactment of just laws governing the use of the highways by all vehicles; to secure the betterment of road conditions; to promote the building of good roads; to place guide-boards, warning signals and road directions; to remove visual

The two cars are now operated on the same schedule as last year, making the first trip to Sagamore Hill at 7 in the morning and the last trip after midnight. There is but little time during the day when the cars are not engaged on some official mission. Last season, the two cars went through the four months season with a record of never having missed a trip and never having been late.

Few Starters in Albany Club's Tour.

Though 20 entries were expected for the fourth annual tour of the Albany (N. Y.) Automobile Club, only six cars actually left the capital city on Saturday last, 20th inst. The cars went direct to Greenfield, Mass., and from there to Providence, R. I., New London, Conn., and arrived in New York last evening (Wednesday). Of the six starters two have dropped out; the four contestants will leave New York to-day for Albany, over a route which will lead through Waterbury, Conn. The tourists are due in Albany to-morrow. The tour is somewhat of an endurance and reliability run, and the car returning to Albany with the seal of its bonnet unbroken will be awarded the McClure Cup.

AMERICAN ENTRY IN KEEN PURSUIT

Thomas Car Nearly Overtakes the German Protos at Irkutsk—The Italian Zust Remains far Behind.

Latest reports from the cars still engaged in the New York-Paris "race" represent that the much-repaired German Protos car—which crossed a part of the American continent on a railroad flat car—arrived at Kansk, about half way between Vladivostok and Moscow, early in the morning of the 23d inst. The run from Irkutsk, 532 miles, was made in 45 hours, or better than 266 miles per day. The car was equipped at Irkutsk with a powerful searchlight, shipped from Berlin for its use, and which enables it to travel as well by night as by day.

Lieutenant Hans Koeppen, conductor of the Protos car, who announced his arrival at Kansk in a dispatch to the Zeitung am Mittag of Berlin, announced that the American Thomas car was 24 hours behind him at Irkutsk. Reports from Paris, however, represent that the American car started only nine hours after the German car, in pursuit of it. The Thomas, according to reports from the correspondent on that car, nearly caught the Protos at Irkutsk, and in fact was up with the Germans on the eastern shore of Lake Baikal, but with only four minutes in which to load the car on the freight train that carried the Protos across the lake. Accordingly the Americans, having thus cut down a lead of two days gained by the Protos, had to stand and see the train pull out with the Germans on board. They took the next treight train to catch the evening steamer and reached Irkutsk about two hours after the German car had left that place.

The run from Irkutsk to Paris in the Peking-Paris race was made by the Itala car in forty days' actual running, or an average of 175 miles per day. The road conditions are generally good and if the Protos and Thomas cars maintain equally good speed they will arrive in Paris before the first of August.

Nothing has been heard at Berlin concerning the Italian Zust car since a St. Petersburg report of the 19th inst., when that car was said to be at Harbin.

Erle Winner of Prince Henry Cup.

Cable advices state that Fritz Erle, of Mannheim, proved the provisional winner of the contest for the Prince Henry touring cup, which ended at Frankfort-on-the-Main. Wednesday night, 17th inst. Of the 130 machines which made the start from Berlin on the 9th inst., 112 finished. The official lists, showing the actual winner, are yet to be made public. The large majority of the cars participating were of German make, but ten Belgian drivers, nine French and a few of other nationalities started.

Depot Lane Hill for Climbing Contest.

One of the big New York newspapers scored a great "scoop" and Tuesday last! It told the world that the Riverside Motor Club will, on July 8, hold a hill climbing contest on Depot Lane Hill, a short, steep, narrow grade with two sharp turns, almost right angled turns, which leads from Lafayette boulevard to Fort Washington avenue-a grade such as will justify a verdict of the manslaughter which the contest invites. There are to be contests for every type of car, not excepting taximeter cabs carrying four passengers. The newspaper which heralded the "scoop" failed, however, to remark the real news of the affair, i. e., that such an organization as the Riverside Motor Club actually is in existence in New York City. It is probable that it "grew" over night and has its habitat in a press agent's hat. It is not likely that the "club" will send his picture to the press.

Silver Trophy for Breaking Speed Law.

Chanslor & Lyons, of Los Angeles, Cal., have offered a perpetual incentive for lawbreaking-a silver trophy bearing their name, on which will be inscribed the names of all who break the record from Los Angeles to San Diego and return, a distance of 320 miles. At about the same time as the announcement of the offer of the trophy was made, L. B. Harvey was gathered in by a posse of armed sheriffs at San Luis Obispo, while engaged in shattering the San Francisco-Los Angeles record. The police of several other towns had tried to stop him, but he dashed past them, but finally was headed off by the aid of the telegraph.

California Cops to Lasso Scorchers.

In certain parts of California the lariat is to be used for the purpose of "roping" chauffeurs, much in the same manner as horses or cows are captured. By an order issued by Chief of Police W. I. Beggy, all mounted patrolmen in San Francisco are directed to carry lariats ready for use, and the policemen are instructed to lasso chauffeurs who break the speed law and do not halt when commanded to do so. To the uniniatiated it seems that considerable skill

would be required to send a rope whirling through the air in such a manner that it would find a way to get underneath a cape top, or limousine bonnet and encircle the body of an offendng driver.

Saturday an Automobile Sabbath.

Under the recently enacted amendment of the motor vehicle law of Nova Scotia the municipalities and counties of that province are passing ordinances fixing certain periods when the operation of motor vehicles is prohibited. For example, the local authorities of Yarmouth have prohibited the running of automobiles on the city streets between midnight on Friday and the same hour on Saturday of each week. Violation of the ordinance is punishable by a fine of \$20 for the first offense, \$30 for the second, and \$50 for the third. The prohibition is intended to assure the safety of country people who flock to the town on business at the end of the week.

Utilitarian Progress in Motor Vehicles.

Progress in the commercializing of the motor vehicle is more rapid than might be supposed. As illustrating the breadth of utility covered by its special applications, may be mentioned two instances which have come to notice recently. In one case, a machine had been designed for use as a cotton gatherer, and was intended to be run through the field between the rows, automatically packing the cotton into a receptacle in the body. In the other an original form of street sprinkler was combined with a self-propelled running gear, also of original design.

Automobile Line for Bradley Beach.

James H. Bradley, who founded Asbury Park and when that seaside city grew beyond his control, went farther down the Jersey coast to establish the new resort known as Bradley Beach, purposes adding an automobile line to the attractions of the place. It is to carry passengers between Fletcher Lake and Avon for a nominal fare of five cents. Whether the line will pay for itself or not is no factor in the proposition, the main idea with Mr. Bradley being to add to the pleasure of summer visitors.

Hoodoo Car "Sold for a Song."

Almost as good as winning it in a lottery is the acquisition of a four-cylinder 20 horse-power touring car for the munificent sum of \$58.79. Yet this is the sum for which Gustavus Boyd, president of the Columbus (Ind.) Machine Works, became the possessor of an automobile of the afore-mentioned description.

According to the tale told by the Columbusites, the machine has a hoodoo somewhere about it, which has not yet been routed out. The known history of the car is as follows: A few months ago a man came to Columbus with the car, which he left at the garage of a Columbus Machine Works. He wanted it to be overhauled and put in condition. The bill for the job amounted to \$58.79. Days, weeks and months passed, but no one came for the car. Mr. Boyd was anxious to find the owner, but could not do so. Finally the machine company decided to have the sheriff sell the car at auction. This was done. but nobody would bid over \$50. Then Mr. Boyd bid the amount of the repair bill and took the machine. It is said that this is the machine which went over the edge of a bridge into the Chicago river some time ago and killed four of its passengers.

Skippack Hill for Norristown Climb.

Skippack Hill, on the Reading pike, five miles above Norristown, Pa., will be the scene of what likely will prove a notable hill climbing contest on June 27th, the Norristown Automobile Club having secured permission from the authorities to use the hill for that purpose on that date. The hill rises 347 feet in 6,270, and as the surface is of fine macadam without a water break or obstruction of any kind, some fast time may be expected. The meet has been sanctioned by the American Automobile Association.

Automobiles to Race at Virginia Fair.

One day of the Virginia State Fair at Richmond, October 5-11, will be devoted wholly to automobile sport. Dr. H. W. Bassitt, chairman of the Richmond Automobile Club's racing committee, will have charge of the program.

STRUCTURE OF EXIDE BATTERIES

Bruce Ford Sheds Light on It for the Non-Technical—Also Gives Points to Car Builders.

Storage batteries are more or less a thing of mystery to the average motorist, even though he be the owner of an electric vehicle. In a paper to be read to-day before the Society of Automobile Engineers at its Detroit meeting, Bruce Ford gives an account of the structure of the well-known Exide batteries, which cannot fail to be enlighteining to the non-technical, while he also mentions a number of points which are well worthy the attention of the manufacturers of vehicles employing storage batteries for one purpose or another.

Originally employed only for purposes of propulsion, storage batteries have now come to be used also for a variety of other purposes, such as ignition, lighting and combinations of the two. The principle of construction is the same in all cases. Differences in purpose, however, entail slight differences in construction, such as are noticeable in the case of the two classes of battery used in propelling pleasure and commercial vehicles. As, being the more common, the bulk of the paper is devoted to batteries of the latter two types.

"In design," says Mr. Ford, regarding the structure of the battery, "the positive and negative plates are similar, the positive grid, however, being thicker and heavier that that for the negative plate. The standard grids are 7-32 inch and 3-16 inch thick respectively. The grid consists of a frame around the outside of the plate, having vertical bars throughout the body of the plate spaced about 3/4 inch apart and which extend from its top to its bottom edge. There are horizontal rods of very small section flush with the surface of the grid and spaced about 1/4 inch apart on each side of the plate; the rods on one face of the plate are not placed opposite those on the other face, but midway between them, or in staggered relation. It is thus seen that the body of the grid contains open spaces about 34 inch wide, which extend from the top frame to the bottom frame and are enclosed by the horizontal facial rods; these open spaces are filled with the lead oxide paste, which, when in position, sets like cement in the form of a pencil about 3/4 inch wide, held in its position between the vertical bars and between the facial horizontal rods. The plates, after being pasted and the paste allowed to set, are given an electro-chemical formation, during which the paste or active material of the thicker plates becomes peroxidized, making them positive plates, while the active material of the thinner plates becomes reduced to porous, spongy metallic lead, making them negative plates.

"The plates are made of different sizes,

but the two sizes most used are the MV, 85% inches high by 534 inches wide, and the PV, 85% inches high by 434 inches wide. The MV is rated at seven amperes per positive plate for four hours, and the PV at six amperes for four hours; a sufficient number of cells are connected in series to give the required voltage. Each cell consists of a rubber jar, an element and electrolyte. The rubber jar consists of a deep rectangular box of hard rubber, with walls 1/8 inch thick, more or less, according to the size and service. In the bottom of the jar, and made integral with it, are bridges or ribs of height consistent with the service and whose function it is to support the weight of the element and to provide space into which is deposited the sediment thrown off by the plates with wear.

"The element consists of positive and negative plates burned to straps and kept apart by separators interposed between the positive and negative plates. In assembling an element, a negative plate is laid down with a separator, on it, then a positive plate, separator, negative plate, and so on. The plates are so placed that all the lugs of the positive plates are on one side and all the lugs of the negative plates are on the other side. A strap, consisting of a flat strip of lead or lead alloy having retangular openings in it of the same dimensions as the cross section of the lug of the plates, these openings being spaced to register with the lugs, is then placed over the plate lugs of the positive plates, and a similar strap is placed over the lugs of the negative plates. The lugs are then burned into integral union with the straps. In pleasure vehicle service it is customary to make the plate lugs comparatively short, so that the straps are somewhat below the top of the jar, and a cover consisting of a rectangular piece of hard rubber is placed on top of the straps which are furnished with projections extending through holes in the cover and by which the cells are connected by burned joints. In commercial service the batteries are usually assembled with top straps. . . .

"The separator, which has proved by experience to be the most successful, consists of a piece of wood veneer with parallel grooves about 1/4 inch wide, spaced close together and plowed out of one side, the plain sides being placed directly against the faces of the negative plates. A thin sheet of perforated hard rubber is placed against the grooved side of the wood and rests against the face of the positive plate; this perforated rubber performs a double function, in that it protects the wood from the oxidizing action of the positive active material and also tends to restrain the wearing action of the wash of the acid on the active material of the positive plate. The grooves of the wood separator are arranged vertically, and there is thus a number of free channels for circulation of the acid and for the escaping gases liberated during the action of the battery, especially toward the completion of charge. The wood of which

the separators are made is given a chemical treatment to remove substances contained in natural wood, which would otherwise do great damage to the plates.

"The cells are filled with electrolyte, which consists of a mixture of pure sulphuric acid and pure water, with a specific gravity of about 1.210. After the battery is fully charged the specific gravity reads about 1.280; the reason for this rise in gravity is that the negative plates before leaving the factory are given a slight sulphating treatment to prevent their oxidation; in giving the battery its initial charge the sulphate is reduced to spongy metallic lead, giving sulphuric acid to the electrolyte, which raises its gravity.

"In pleasure vehicle service it is customary to enclose the cells with a tight-fitting rubber cover resting on the plate straps slightly below the top of the jar, and to scal the joints with sealing compound, placing a rubber plug in a hole in the center of the cover for filling cells with water to replace evaporation, the plug being supplied with a small hole for the escape of gases. In commercial service, covers are often dispensed with altogether, as the batteries are usually in service a greater proportion of the time and require filling and inspection much oftener. . . . From 40 to 42 is the largest number of cells that it is customary to use, as more than this number cannot be charged in series from a 110-volt lighting circuit, and, without special and inconvenient apparatus, it is bad practice to charge batteries in parallel.

"The durability of a battery not only depends upon pure materials and uniformity of methods in manufacture, but also upon the care which it receives in operation. A battery could be ruined in half a dozen discharges by sufficient abuse, whereas, with good treatment the same battery might have run for several hundred discharges.

"The life of a battery with pasted plates is normally limited by life of the active material of the positive plates, which with each charge and discharge become more soft and loose at the surface, gradually washing out. As this washing out depends chiefly upon the number of charges, and, within usual limits, is practically independent of the strength or duration of the discharge current, it may be readily seen that statements of life expressed in time, or total mileage, are apt to be misleading.

"Demands are made from time to time for a battery having a greater capacity for unit of weight. It is an axiom in storage battery work that greater capacity for unit of weight means decreased durability. The simplest way to increase capacity with the same weight, is to fill the plates with a more porous paste. This results in a paste which, with use, becomes softened up and washes out more rapidly, and is not considered good practice. The preferable method is to make the plates thinner and put more of them in each cell. A plate of one-half the

time.

thickness will not have the same capacity as a plate of standard thickness, but it will have more than half the capacity. The life, expressed in number of discharges, is naturally less in the special thin plate combination. If, however, the full capacity is taken out on each discharge, the life in ampere hours, or, in other words, the mileage obtained, would be about the same as with standard plates fully discharged each

"The aim in the design of the Exide cell is to produce the greatest watt output per pound at the 4-hour rate of discharge, consistent with durability. The straps and plate lugs are not only designed with reference to mechanical strength, but also are made of cross section consistent with drop in voltage, to give the maximum watts per pounds at the cell terminals. In the vehicle battery this is a most important feature. There are many cases where the vehicle manufacturers could give advantageous consideration to the drop in conductors. An Exide cell discharging at the 4-hour rate is giving, roughly, two watts per pound or cell. In ordinary cases the most economical size of wire to use for the conductors would be that which would give a loss per pound nearly equivalent to the output per pound of battery; or a conductor loss of about two watts per pound of wire, since the number of watts per pound should be a maximum at the motor terminals and not only at the battery terminals.

"There are probably many cases where the addition of a pound to the wire or to the controller contacts would save three watts or more at the motor terminal. It would seem that aluminum is a metal particularly well suited for wiring electric vehicles, since its weight for the same conductivity is much less than that of copper. By using aluminum conductors it would, therefore, be possible to reduce the weight and also to reduce the total loss in conductors both together. . . . I have, however, never heard of aluminum being used for this purpose in this class of work.

"Storage batteries for the ignition of automobile gas engines have become quite an important development of the storage battery business. For this class of service it is not only necessary to have substantial and durable plates and fittings, but it is necessary that all the parts should be mounted in a compact and durable manner. Batteries for this class of work, at the present time at least, must be built for abuse. They are frequently discharged until practically exhausted, and they are allowed to stand in this condition. No battery worked in this manner can give the best results, and it is economy to take care of the batteries in this class of service just as it is economy to take care of them in other classes of service. The discharges, however, extend over long periods of time and. even when abused, after the battery has given comparatively few discharges it has had a considerable life, measured in time."

THE MOTOR WORLD

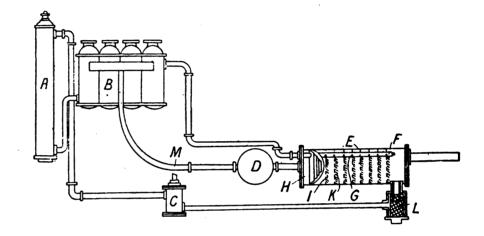

ROBS THE EXHAUST OF ITS ODOR

How the Ill Smelling Properties are Arrested by a New Foreign Invention— Simplicity of the Device.

Despite the fact that the exhaust from gasolene motors continues to be more or less obnoxious, very few complaints are heard of the offense which it causes, even in the closely congested city streets. Time was, not long since, when a number of propositions for alleviating this nuisance were suggested, while a couple of years or so ago, considerable publicity was given to the plan of a foreign inventor for perfuming

ing system of the motor. The entire circulation of cooling water is carried through the device, and no other special provisions are required.

The arrangement of the radiator, A, cylinders, B, water circulating pump, C, and exhaust pipe and muffler, M and D, are plainly marked in the illustration. The exhaust entering the deodorizer, E, meets the deflector, H, by which it is spread out into a thin and uniform spray over the entire section of the chamber. It immediately impinges against a series of gauze screens, M. which are backed by wicks, K, of asbestos or cocoanut fibre. After passing these filtering layers, the remaining gas passes off through the outlet shown at the right. The return from the water jackets of the mo-

the exhaust. That the idea still finds its adherents, however uncalled for it may appear with the present good design of the average motor, is shown by the recent introduction in England of an exhaust deodorizer. This system is the invention of Messrs. W. R. C. Wakley and R. Parsons, and is being marketed by Deas & Co., of London.

In principle, the system involves the use of a scrubber, in general arrangement not unlike those which are used for freeing coal gas from its tarry ingredients before completing its preparation as the ordinary illuminating gas of commerce. That is to say, the exhaust products from the motor are passed through a special form of filter over which a constant stream of water is passed, the result being the removal from it of a large proportion, if not of the entire amount of the sooty and tarry residue of combustion. The remaining vapor, in its cooled and filtered condition is permitted to escape in the usual manner, while the residue is washed into a receiver where it is entrained until removed during a periodical

The apparatus required to complete this process is astonishingly simple. As shown in the accompanying illustration, it comprises merely the attachment to the usual discharge pipe from the muffler of the deodorizing tank or scrubber, which also is included in the return lead of the water cool-

tor, enters the device through the spray pipe F, which distributes a fine spray throughout the chamber, and keeps the wicks and screens continually cool and moist. The overflow, carrying the impurities which have been washed from the gases, is drained into the sump, L, where the water is filtered before being returned to the circulating pump.

In practice, it is said that this system has given surprisingly good results. A deodorizer applied to one of the motor omnibuses of the London Road Car Co., worked so thoroughly that even when the motor was over-lubricated purposely, the exhaust discharged was only a white vapor which proved to be entirely free from odor. Again, as applied to a private touring car, and tested by the owner, even when adjusted to the conditions generally supposed to contribute to an obnoxious exhaust odor, it was possible to hold a sheet of white paper close to the discharge orifice without staining it.

Were any material complication involved in its design, or any expense or trouble attended its use, it would hardly seem practical to consider the purification of the exhaust, even in town car practice. If so much can be done by the simple use of the cooling water in such a way as has been described, however, the idea would seem to be well worth considering with regard to its applicability to car design.

VARIATIONS IN VALVE TIMING

Table Showing Systems Adopted by Different Makers—Useful for Both Repairmen and Owners.

Because of the considerable variation in the methods of valve timing adopted by the different makers, repairmen as well as owners, frequently become not a little embarrassed in resetting the valve gear of a motor which has been dissected without the precautionary measure of first taking note of the proper arrangement of the actuating mechanism. Such a contingency seldom arises where ordinary precautions are taken, but the bare possibility of such an event, as well as the necessity of knowing the timing when remodelling an engine, or replacing parts of the valve gear in a machine which has been smashed in an accident. make it a great convenience to have the required data at hand for an emergency.

With this object, two foreign papers, the Motor-Car Journal, in England, and Omnia, in France, have been publishing a series of articles giving the timing of the most commonly known motors of their respective countries. The accumulated results, are

given in the accompanying table, which should prove a useful piece of memoranda for those who have to deal with engines made abroad. An interesting point which is observable in this connection, is the extreme divergency of settings used. As the valve setting is regulated in large measure by the area and contour of the ports, as well as their location, and even the size of the valves, this diversity in practice abroad, indicates very clearly the lack of conformity to standards, which prevails.

Attention should be called to the distribution effected by means of the Larrad Timer. Although listed as a motor, this device, which was described in the Motor World not long since, is nothing more nor less than an attachment, which may be applied to any engine, and which is intended to facilitate the setting of valves and ignition mechanism. Furthermore, it is intended to establish a uniform setting for all motors to which it is applied, its constructors avowing that the arrangement which it secures is not simply applicable to all motors, but further intimating that its use would be beneficial when applied to motors the timing of which was not in conformity with it. How great a change this would effect in the distribution of several well known engines, as well as the probable consequences of using it is readily seen.

MUST SUE CITY FOR PAYMENT

How What Looked Like "Easy Money"
Wasn't so Easy as It Looked—Dispute
Over a Municipal Purchase.

Municipal ownership as it relates to motor cars occasionally develops some unusual phases, as one of the manufacturers who sold the car to the city of New York has discovered. The money obtained from the sale of such cars is not always such "easy money" as it appears to be.

According to reports that are given credence in various city departments, the company who furnished the car in question was accused by the comptroller's office of not alone supplying the municipality with a second hand vehicle but with attempting to collect for it a sum in excess of the amount for which private individuals could purchase it; the manufacturers charged \$3,500 for the car to the city, and the finance department claimed that the same model could be bought for \$3,000.

A representative of the makers appeared before the comptroller and denied that the car was second hand, while admitting that it had become shopworn and that the upholstery had been replaced owing to its having become moth-eaten. He further stated that \$3,500 was the lowest price at which anyone could purchase this model of car.

About this time the makers of the automobile received a letter from a prospective purchaser asking a quotation on the same type of car as the one under discussion. They responded and quoted \$3,250, to which the prospective purchaser replied that the price was absurd as the firm had sold one car—he named the buyer—for \$2,750. The manufacturers admitted that this statement was true but said that only one car had been sold at that figure.

In the meanwhile the heads of other city departments were interviewed and it was learned that this same model car had been offered to them for \$3,000. The various statements concerning the assortment of prices at which the car had been offered. was then forwarded by the city authorities to the manufacturer, who replied that the statements were not true and that the only price of the car in question was \$3,500 and that this price was strictly maintained, the only exception to it being in the case of the person who had bought one for \$2,750. The city, however, is not satisfied and having refused to pay the bill, the question will be left for the courts to decide.

Gasolene Cost High in Spain.

A quantity of gasolene which costs 20 cents in the United States is sold in Spain for \$2. In the latter country the cost of automobiling is as high as in any country of Europe.

COAL TAR AND PITCH FOR ROADS

Highway Commissioner Macdonald's Specification for Binder Material—Successfully Tested in Connecticut.

Coal tar and pitch combined as a binder in building macadam roads has been tried with such success by Highway Commissioner Macdonald, of Connecticut, that he has been invited to read a paper on the subject at the International Road Congress in Paris next fall. He has worked out a specification for the use of these materials and it has been adopted by a number of other highway commissioners. Something over a year ago Commissioner Macdonald chose a very hot day and laid his specification on most of the roads in Bushnell Park about the Connecticut State capitol in Hartford and the present condition of these roads, which is as good as the day the coal tar combination was put down, testifies to the excellence of the specification. Not only that, but these roads are unusually good ones on which to try out the coal tar for the reason that they are used by automobiles far more than by any other vehicles.

It happens that before he became State highway commissioner a dozen years ago, Macdonald had been for years at the head of a New Haven firm which laid, and still lays, tar and asphalt pavements, and he was peculiarly fitted to grapple with the destructiveness of automobile tires on macadam roads when it became a question of seeing the fine system of roads in Connecticut which he is building disintegrate before his eyes unless he could find a protection for them. There were two things to be done, find a road-surfacing material which is finished when laid and solid, so that it makes no dust and needs no dust to maintain its integrity, or find a method of laying the dust. Some roadmakers have not given over trying to find the latter yet, but after various and varied experiments, Commissioner Macdonald finds that a mere dust laver-which means oil, is of little value. It must be frequently renewed and cannot be repaired.

Commissioner Macdonald's specification lays great stress on the necessity for having all parts of the road perfectly dry when the coal tar and pitch surfacing is laid. After the shoulders and gutters have been formed and shaped the contractor must clean off all dirt or accumulations with split rattan brooms or a horse sweeper, until the No. 2 stone is entirely bare, clean and free from all material except such as is found in the No. 2 course, so that there is no interruption between the tar and the No. 2 course of stone. This No. 2 course is to be evened up to grade, also.

Then comes the coal tar application. About 15 per cent. of pitch is to be melted into the tar and thoroughly mixed with it,

the whole to be heated to a temperature of 225 degrees. At this temperature the mixture is flooded onto the road and broomed in with split rattan brooms. When this first application has become entirely absorbed, a second application of exactly the same thing is to be applied in just the same way, the two making a perfectly solid surface on top of and in combination with the No. 2 course of stone, which is about one inch, longest diameter, in size.

While the second application is still hot and sticky, the top dressing of trap rock splinters from one-half to three-quarters of an inch, longest diameter, is put on to a uniform depth of not less than an inch. Two inches will be even better. At once a steam road roller of not less than ten tons' weight is to be run over the surface of this, and to be kept running over it until the top dressing is thoroughly imbedded in the tar and pitch composition. Then the road must cool thoroughly before any use whatever.

There are several important conditions which must be observed, too, chief among them, perhaps, being the requirement that the day must be hot. "No water gas tar will be allowed to be used, nor any adulteration of the coal tar. Nothing but pure coal tar shall be used in the work." In several different ways the necessity for the day to be hot, the road to be dry and clean and only new and fresh stone from the quarry, free from dust, are emphasized.

What Lightning Did to a Car.

Probably all motorists who have had the experience of driving during a thunder storm have been conscious of more or less nervousness because of the vague possibility of lightning striking the mechanism. Strange to say, however, instances in which this has occurred are practically unknown. One of the few on record was the fate of an English owner who was caught in a severe storm while crossing an elevated and unprotected plateau in Sussex. The car was in an exposed position, and no shelter was available when the storm reached its climax.

"One flash was blinding," says the author of this experience, "followed by a smell of burning, and three out of the party of four got out of the car. We lay down on the ground by a little heap of hay, and it was like one imagines it must feel to be in the midst of bursting shells or bombs. We could almost feel the storm touching us. When it was over the car would not go properly, and we found that the insulating wires had evidently been struck by the lightning and the rubber was melted as if it had been in a furnace; moreover, we carried three accumulators, and the two spare ones, had been completely discharged by the action of the lightning."

"The A B C of Electricity" will aid you in understanding many things about ignition that may now seem hard of understanding. Price, 50c. The Motor World Publishing Co., 154 Nassau Street, New York City.

UP-TO-DATE HIGHWAY ROBBERY

One of the Tricks Whereby Automobilists are Made to "Stand and Deliver"—Its
Unlawful Aspect Shown.

What was supposed to be a trap designed to aid the "shaking down" of automobilists was encountered a few days ago near Niantic. Conn., by Hiram P. Maxim, of Hartford. A lot of mad and rubbish placed in the roadway, ostensibly for road repairing, suggested the possibility of a stalled automobile and a farmer with his ox team on hand, ready to "pull her through" for a consideration. Mr. Maxim, who was accompanied by one of the judges of the Superior Court, had no inclination to assist in buying fodder for the cattle, but by sheer force of bucking through the mud escaped the shakedown. On his return to Hartford he took steps to have the matter looked up by reporting the case to Schutz & Edwards, attorneys for the Automobile Club, asking for a legal opinion on such traps. Mr. Schutz sent the following reply:

"Dear Sir: Replying to yours of the 25th we beg to say that for the well being of other automobilists it is most advisable than an example be made of the scheming trap setter whom you encountered near Niantic. We have examined the statutes to see whether he is guilty of a criminal offense and the following sections seem to most nearly cover the case. Section 1181 of the General Statutes provides:

"'Every person who shall, without the written consent of the selectmen of the town, place or deposit in any public highway any stones or waste material, which shall in any way impede, hinder, obstruct or interfere with the repairs of such highway, shall be fined not more than \$7."

"Chapter 53 of the laws of 1907 provides: 'Every person who shall knowingly throw or place or cause to be thrown or placed in or upon any highway or street, any nails, tacks, glass, crockery, scrap iron, wire or substances of like nature and suffer the same to remain in and upon such highway or streets, shall be fined not more than \$20 for each offense.'

"As you will see these two statutes do not in terms exactly cover the case which you state, but the first one seems to us to be broad enough provided it could be shown that the 'repairer had no written consent from the selectmen.' It seems to us that the best way to bring the matter to a head is for us, as attorneys for the club, to write to the selectmen of the town of Niantic, calling their attention to the matter and informing them that if such an act is repeated, the perpetrator will be punished to the full extent of the law."

Mr. Maxim and Mr. Schutz have not as yet decided whether an attempt will be made to prosecute the Niantic trapsetter.

The Week's Patents.

885,585. Combination Steering and Driving Axle for Motor Vehicles. James P. Carpenter, Ithaca, Mich. Filed Oct. 14, 1907. Serial No. 397,426.

1. In a combined steering and driving axle for motor vehicles, the combination with an axle having on its opposite ends socket members, of wheel spindles having on their inner ends ball members adapted to engage said sockets on the ends of the axle, anti-frictional bearing balls arranged between said ball and socket, means to lock said socket against revolution on said ball, whereby the latter and the spindle connected thereto are driven by said axle irrespective of the angle at which said spindles are turned, and a supporting yoke connected to said axle and spindle, substantially as described.

885,646. Vehicle Tire. Mary B. Priest, Milwaukee, Wis., assignor to The Priest Tire Company, a Corporation of Wisconsin. Filed Feb. 18, 1907. Serial No. 357,809.

A vehicle tire comprising a flat metal wheel rim, a one-piece pneumatic casing having inner flanges projecting from its side wall fitted to the wheel rim, rings fitted over the inner flanges of the casing, securing bolts connecting the rings and wheel rim, a flat casing tread having flange extensions projecting beyond the side walls of said casing, cross grooves in the face of the tread, a metallic band fitted to the tread, a detachable rubber tread having flanges coincident with the flange extensions of the casing tread mounted upon the metallic band, an apertured metallic side guard having flanges engaging the flanges of said detachable tread, lips extending from the apertured portion of the side guard engaging the flange extensions of the casing, and clamping bolts in connection with the side guards fitted into the cross grooves.

885,655. Holder for Spare Tires. Edward H. Stickels, Edgewater, N. J. Filed June 16, 1906. Serial No. 322,017.

1. In a holding device for spare tires, a fixed member, a movable member slidable on the fixed member, a strap secured to and connecting the members, and means whereby the movable member will be locked to the fixed member by the tightening of the strap.

885,684. Frictional Driving Gear. Denis M. Broughton, Woodford Green, England, assignor of one-half to The British Sigarera Limited, London, England. Filed Sept. 14, 1907. Serial No. 392,830.

1. In a clutch, the combination of a shaft, a pulley mounted on said shaft and provided with a rim, a resilient strap, the tension of which is normally outward to impinge the inner surface of the rim. an arm fixed to the shaft and connected to the strap, a pivotally mounted lever pivotally connected to the opposite end of the strap, a slidable beveled member operable in the path of movement of the pivotally mounted arm to withdraw the strap out of contact with the rim.

885,704. Motor Vehicle. George J. Taylor, Salt Lake City, Utah, assignor of one-half to Alonzo E. Hyde, Salt Lake City, Utah. Filed Oct. 19, 1907. Serial No. 398, 226.

1. The combination with a motor vehicle, of a rotary fan mounted thereon in position to protect the occupant of the vehicle from wind pressure, dust, etc., and means for driving the fan in a direction to

protect the said occupant when the vehicle is in motion.

885,796. Pneumatic and Other Tires. Henry C. Shearman, Providence, R. I. Filed June 13, 1903. Serial No. 161,287.

1. In combination with a wheel rim and a tire having free ends, a lever with one end bearing on an approximate end of the tire and the other end bearing on the wheel rim at a point anterior to that occupied by the other end of lever when ends of tire are united or contact together in their allotted position on wheel rim, substantially as shown and described.

885,814. Selective Lever. Thomas W. Warner and Frank H. Jones, Muncie, Ind. Filed April 22, 1907. Serial No. 369,553.

1. The combination, in a selective lever, of a stationary structure embodying a segmental plate having a central slot or opening and notched flanges alongside said opening, a plurality of sleeved shafts, a sub-lever for each shaft and having a slot in its upper end, a spring operated engaging device secured to each sub-lever embodying a lug extending through the slot in the sub-lever pivotally mounted at the lower end and extending up through the opening in the segment, said operating lever having projections on opposite sides thereof respectively arranged to engage with and force back the lugs of the spring operated engaging devices on the corresponding sub-levers, each of said projections being of such length as when one of them is fully engaged with the corresponding sub-lever that the other will be free of engagement with the notch in the flange adjacent thereto.

885,822. Automobile. Arthur H. Wright, South St. Paul, Minn. Filed June 21, 1907. Serial No. 380,149.

1. In an automobile, the combination with a front and rear wheel supported truck, of upright cylinders carried thereby, pistons or plungers in the cylinders, fifth wheels supported upon the plungers and supporting the body of the vehicle, said plungers having at their upper ends ball-shaped heads embraced by sockets formed on the lower rings of the fifth-wheels.

885,842. Turn Table. Sterling Elliott, Newton, Mass. Filed July 5, 1907. Serial No. 382,140. Renewed March 11, 1908. Serial No. 420.455.

1. In a turntable, the combination of a bed casting having a circular track, a rotatable platform supporting frame also having a circular track, an interposed rotatable roller supporting frame having a plurality of longitudinally adjustable radially disposed shafts, and an anti-friction roller on each shaft which engages said tracks, substantially as described.

885,845. Vehicle Suspension. Robert G. Handy, Bay City, Mich. Filed Dec. 17, 1906. Serial No. 348,129.

1. In a motor vehicle, the combination with an axle, a body supporting frame, a strut substantially parallel to the axle and a spring yielding means supporting the frame on a strut, of a pair of obliquely crossed, independent bars in a plane substantially parallel to the axle, each articulating an end of the strut to the remote end of the axle.

885,848. Circuit Breaker for Automobiles. William C. Horner, Indianapolis, Ind. Filed May 27, 1907. Serial No. 375, 963.

1. In an automobile, the combination, with the sparking circuit of an internal

Nuts That Require Tightening After considerable use the bolts driving wheels of chain driven cars tend to become loosened in the spokes. Hence, when overhauling an old car, it is well to tighten the nuts which hold them in place, riveting over the ends for the sake of security. In doing this care should be taken not to throw the sprocket out of line.—From "Motor World," August 8, '07.

Use Columbia Lock Nuts

Stoddard-Warton 1908

"THERE and BACK' at a **Big Saving**

E VERY Stod machine that leaves our big shops is built for endurard=Naar

ance runs. Model 8-K Roadster possesses the same high qualities of power, noiseless ease and dependability which have given Stoddard-Dayton cars national prominence as "Cars That Will Take You There and Bring You Back." A car that costs \$1,850 less than others in the same class and one that is maintained at smaller expense. These are two Model 8-K attributes pleasing to the one who pays the bills.

otoddard-Dayton

Stoddard-Dayton 8-K Roadster is a rakish machine—the sensation of the year. Climbs hills like the wind. Motor, valve-in-head type, four cylinders, cast in pairs, 434x5 inches. 40-45 H. P. Transmission, selective sliding gear type, three speeds forward and reverse. Price, \$2,500 F. O. B. Dayton. Extras: Magneto, \$200; Top, \$75. Send for 1908 Catalog.

THE DAYTON MOTOR CAR COMPANY, DAYTON, OHIO

Stoddard-Bayton 1908

The Severest Tests

have demonstrated time and time again that the principles employed in

Timken Roller Bearings

are the only correct ones that insure perfect transmission of all power to traction use, eliminating both friction load and end thrust.

A Stoddard Dayton Stock Car equipped complete with Timken Roller Bearings finished April 12th, a ten-day century run, 1,000 miles over the roughest roads with all adjustments sealed, something impossible for a car equipped with the ordinary

type of bearings to perform. This car, as do all cars of the Stoddard Dayton make, carries a full equipment of Timken Roller Bearings, as tests made under the most adverse and severe conditions have proven them an economical factor in the saving in wear and tear from strain alone.

And these are some of the reasons why more than 65 per cent. of all the makers of high grade American Automobiles and over 90 per cent. of the Commercial Truck builders are now using them. Are you? If not, won't you let us give you some figures that prove. These are yours for the asking.

The Timken Roller Bearing Axle Company, Canton, Ohio Branches: 10 East 31st Street, New York 429 Wabash Avenue, Chicago
